CATERPILLARS AND FRUIT TREES.

THE alarming irruption of caterpillars, which has apparently done so large an amount of damage to our fruit crops this year, naturally calls for investigation as to its causes and possible remedies. It is all the more singular in its occurrence, because just at this time there has been much discussion upon fruit growing in England as a source of profit, and the experiences of the present summer cannot be said to be by any means encouraging. At this moment, however, the fruit trees about North Kent seem to be suffering more from an attack made upon them by swarms of aphids or fly than from the work of caterpillars, but doubtless these have rendered the trees less capable of withstanding the exhausting influence of the prolific sucking insects. Though the caterpillars have not quite gone the greater part have vanished; some of course have been killed and some have reached maturity, spinning their cocoons, or entering the soil to become chrysalids.

On investigating the matter there are three things which must be borne in mind at the outset. The first, of primary importance, was pointed out some weeks ago by a correspondent of this Journal—namely, that it was probable 1889 would not be a good fruit year, as a large number of the trees had suffered from the ungenial weather which characterised the summer of 1888. Secondly, that although it is now agreed that insects will attack trees perfectly healthy, still, should there be any unsoundness, the harm done by the insects is intensified. And, thirdly, that in many places the trees suffered considerably from caterpillars during May and June last year, and those now complained of, being their progeny, are descended from eggs deposited last summer and autumn, not during the present season. Probably rather too much effect has been attributed to the caterpillars, the falling off in the yield of fruit which seems all but certain generally, arising from a combination of causes. The abundance of caterpillars, however, was a palpable fact, yet showing a singular capriciousness, even in the space of a few hundred yards, for which no doubt there is an explanation, though we cannot discover it.

Here is an important fact as bearing upon the appearance of these caterpillar swarms in our gardens and orchards, that plants outside gardens, and apt to be infested by the same species, have had less than the average upon them. As instances, I may name the Sloe, Dog Rose, Whitethorn, and to some extent, the Elm. Again, the fact is well known that of the hosts of caterpillars emerging into daylight during our variable spring, the majority are, in most years, destroyed by the winds or rains of April and May. The spring of 1889 was on the whole favourable to caterpillar life, and the much-complained-of easterly wind, if unpleasant to man and blighting to vegetation, does some good work which we missed this year. Several of my friends have suggested that the common practice of allowing grass to grow round the trunks of the trees in our Kentish orchards favours the increase of caterpillars, but I cannot see the connection, except in this way, that it is of advantage to disturb the surface soil about the trees when we notice the presence of caterpillars which enter the earth to undergo transformation. A friend, who is an observer of the habits of birds, tells me that he thinks the insect-eating birds have either been fewer in numbers or less diligent than usual. I remarked to him that some of the species that have been abundant are hairy, therefore seldom touched by birds. This is certainly true of the lackey cater-

pillar and the brown tail, as I think of the ermine species. So much has been written unfavourable to the house sparrow, that I am glad to report this bird has been seen picking off by hundreds the caterpillar of the winter moth (*Cheimatobia brumata*).

From the reports that have been published, and from my own observations, I conclude that this has been the caterpillar which has done the greatest amount of mischief, its attack upon the trees having been made while the buds were beginning to expand, and the insect being also in unusual abundance. It has attacked all fruit trees alike, and the numerous webs have an evil effect, as well as the incessant work of the caterpillar's jaws. The late Edward Newman showed us long ago that of all the remedies for this pest nothing is better than a circle of some sticky substance drawn round the trees, which the female moths, when they begin to crawl up the trunks on their emergence, find themselves unable to pass, being wingless. I have seen the moths by hundreds thus trapped by a tarry compound, which, of course, means the extinction of many thousands of eggs. An odd thing in 1889 is that this capital preventive is said to have failed in some instances, the caterpillars appearing numerous where the trees had thus been treated during the autumn. There are two ways in which this might be explained. It is possible that the process of tree-daubing may have been done too late, the moths being out soon, and having ascended the trunks before this precaution was taken. Or it may be that a portion of the brood remain sometimes in the chrysalis state on the trees, but I must confess I have never seen an instance, having always found the caterpillars burying themselves in the earth when full grown. Then, again, some gardeners speak of finding eggs of the winter moths at the tops of twigs, a position in which the wingless female scarcely ever places them, and I imagine these must be the eggs of another species.

Next in abundance, I think, to the caterpillar of the winter moth has been that of the lackey (*Bombyx neustria*), which is yet about, and now in its solitary stage of life. This insect hatches out later than the preceding, and it has been recommended to search for and clear away its rings of eggs, which remain in the branches and twigs from autumn to spring. According to Mr. Wood, the name should be "lacquer" moth, from the glossy appearance of these necklets of eggs. There should not be any difficulty in removing from fruit trees the bulk of these caterpillars while they are juvenile, as they begin life by feeding upon the lower branches, and the webs or nests are conspicuous, being usually studded over with numerous cast-off-skins. This caterpillar is recognisable by its stripes of blue, red, yellow, and white, and its brown head with two black spots, which might pass for eyes, but are not these organs. The lackey caterpillar spins a cocoon in June, and the moth appears soon after. It has occurred principally upon the Apple, giving this the preference over other fruit trees, and I have also taken off the Apple a few examples of the bluish white spotted caterpillar of the figure-of-8 moth, but it has done no particular harm, though on the Continent it is noted as a frequent feeder upon the Peach and Apricot; its increase, however, is to some extent checked by birds, to whom its plump form is attractive. Two of the ermines (*Yponomeuta padella* and *malivorella*) have disfigured the trees with their webs, their colonies being very numerous in some places; these have attacked the Apple, Plum, and Cherry. Last year gave us warning that these two species were likely to be troublesome another season unless means were taken to diminish the spring brood, but in many orchards this was left undisturbed, and not only the leaf buds, but the fruit buds also, have been so severely attacked that it is likely the result will be the death of some young trees and the exhaustion of older trees, beside the loss of fruit. I have discovered some caterpillars of the brown tail (*Liparis chrysorrhæa*), and should be glad to hear from anyone who has noticed these during this season; it is a species that was formerly very injurious, but has not troubled our orchards of late years. It is a caterpillar sufficiently distinct to be easily recognised,

having on a ground colour of black, scarlet warts, and white tufts of hair.

There has been great diversity of opinion as the best mode of dealing with these caterpillars. The slow and simple plan of removing them by hand has its advantages, though manifestly inapplicable to tall trees, and too expensive for large orchards. Those caterpillars that are more or less coated with hairs disregard some washes, but they are not insensible to a wash containing soap and petroleum. One grower of fruit tells me he was very successful in killing his enemies by the application of dry sulphur. The process of dusting the trees is, however, somewhat tedious and expensive. Another said to me, "I have been shooting my caterpillars," a statement which seemed rather astonishing. I have read, I think, of a gentleman who used to go into his orchard and amuse himself by picking out an Apple or Pear on a branch a good distance off, and aim at it to bring it down, but caterpillar shooting I never heard of before. On inquiry, I found the plan was to fire blank cartridges into the trees, which I am assured brought down the caterpillars in shoals, when they could be easily cleared away; my friend was obliged to admit that it was not exactly a wholesome process for the trees just at that season.—ENTOMOLOGIST.

LATHYRUS SIBTHORPI.

ALTHOUGH this hardy herbaceous plant has probably been in cultivation in England for nearly a century, it is surprising that, considering its attractiveness, it has not been generally grown. The period of its flowering and its neat habit of growth, together with the profusion with which its richly coloured blooms are produced, would not fail to please even the most fastidious. In years when late spring frosts prevail it may have its first flowers destroyed, but as the season advances and more genial weather is experienced this *Lathyrus* soon presents its customary pretty appearance, and maintains it until the month of June is sometimes far advanced. It being necessary to give the plant support, and as it seldom attains a height of much more than 3 feet, ordinary Pea sticks may be used for this purpose, and by putting them around the clumps early in the year some protection from frost is thereby provided, and a double purpose served. To describe the flowers as being richly coloured magenta-red does not fully depict the exceptional colour they attain in their various stages of development. There is nothing in dyed dress fabrics that is identical in tone of colour, and in the silk pattern tints it may be sought for in vain. It is remarkable, too, that those generally credited with being conversant with colours hesitate before pronouncing an opinion. This is occasioned by the degree of light or shade in which the flowers may be placed when viewed, as well as their age, state of expansion, and position. The standard of the flower is of magenta-cerise, passing to rosy-lilac; the wings are more fully coloured with a tinge of carmine, excepting at their base, which is much paler, as is the keel. Frequently as many as nine or ten blossoms are borne in a well-disposed bunch on flower stalks sufficiently long to admit of their being available for the purposes for which cut flowers are mostly prized.

The plant received its specific name in honour of Dr. Sibthorp, a native of Oxford, who was Professor of botany in that University from 1784 to 1795. It is probably this plant that is figured in the second series of Sweet's "British Flower Garden," fol. 333, under the name of *L. rotundifolius* var. *ellipticus*. The plate, however, fails to represent the flowers in their true colours, but the interesting statement is made in the letterpress that "Marschall von Bieberstein gathered it on Mount Beschtan in Georgia." In Maund's "Botanic Garden," vol. v., plate 128, fol. 511, under the name of *L. rotundifolius* this may be the one figured and referred to, but the portrayal of the plant is again defective. It is here described as "a free-flowering perennial species, which is very little known (1834-5), nor is it quite certain through what channel it was introduced to this country. It has long been cultivated in the Oxford Botanic Garden, and there is much reason for supposing that it may have been originally introduced by Dr. Sibthorp." In the "Wiener Illustrirte Garten-Zeitung," 1888, it is mentioned as a new plant; it has, however, been preserved at Oxford from the date of its introduction.—S.

VINES AND VINERIES.

In many gardening establishments Grapes are grown and expected to be well produced in houses unworthy of the term vinery; but men of tact and resource, even under very favourable conditions, grow excellent

crops of Grapes that are creditable in a greater degree than when conditions of the most favourable kind are provided. Light and well-ventilated vineries are a desideratum with all gardeners, but unfortunately in numerous instances they are not to be found even in the gardens of the wealthy. Grapes, above all fruits, appear to create enthusiasm among their owners and gardeners, but this is more noteworthy in districts where gardens are numerous and situate within a radius allowing of visiting and revisiting among employed and employers alike. This is where the inequalities of circumstances occur, and it is with envy that the ill-provisioned looks upon his better-to-do opponent. Living within the environs of Frome are houses of the wealthiest business men, with their more or less well appointed gardens, while extending to a much greater radius are the residences of county families. The latter places are often held as an example for townsmen to imitate, but this can only be done of course on a restricted principle, as means and space do not allow the carrying out of their ideas to a large extent. For instance, the vineries of the upper classes are, during the Grape-growing season, given up almost or exclusively to that crop, while with the smaller grower a vinery has to serve as a plant house as well, summer and winter.

In writing of Vines and vineries, I am tempted to mention the excellent condition of some Vines and crop. The vineries are the result of local enterprise, and highly commendable to the proprietor, Captain Tucker, Keyford House, Frome, and the culture to his gardener, Mr. Bull. In this garden is an example of mechanical skill, accompanied by good results in garden produce. Of the several houses two are devoted to Grapes, which I have not seen equalled this season in any establishment of moderate dimensions. The Vines are in every instance characterised by vigorous yet short-jointed growth, the bunches being much above the average in size, and if a good finish is secured they will be of sufficient quality to do credit to the grower on any exhibition table. Foster's Seedling is represented by very fine clusters, more resembling the Muscat of Alexandria in size of berry, and the examples of this latter sort, as well as the popular Madresfield Court, are very fine. Alicante and Gros Colman are good, while two out of the several bunches of that generally discarded Grape, Muscat Hamburgh, are among the best I have seen for a very long time. In constitution there is evidently a weakness in the Muscat Hamburgh, as this Vine was the only one that showed any signs of sun-scalding in the leaves, although these were, like the others, remarkable for size and strength.

The borders, I am told, are only 2 feet in depth, which necessitates frequent watering, and although the Vines are in such a satisfactory state no stimulant of any kind has been given this season, this speaking well for the quality of the soil, which is dug from an orchard adjoining the garden. What a boon it would be to thousands if such material could be procured so close home!

The houses were built under the owner's supervision, and are, as I said previously, highly commendable to him, for no expense was spared in building and providing convenient means for ventilating; and it is a misfortune that others do not adopt the same measures, the labour saved in the adoption of efficient lever ventilation over the single light method is considerable. The houses are heated by two tubular boilers connected, so that in the event of sharp weather they can both be applied at the same time, this being found more economical than if one only is used and subjected to hard forcing. Mr. Bull informed me that if severe weather prevails the requisite heat can be maintained by applying both boilers with the dampers closed. This is an item worthy of a more general adoption, as apart from economy there is relief in the fact that the boilers are not subjected to any strain, consequently a break-down is not in any way anticipated. The vineries in this range are lean-to's, and the plant structures span-roofed, and it would be difficult to imagine anything more convenient in every item.—W. S., Frome.

AERIDES.

IMPORTED plants are invariably established in pots, and beginners succeed well with them for a time. But after they need larger pots the plants often assume an unhealthy appearance, principally by crowding the roots and placing about them too much material. They can, however, be well grown in pots, but some experience is needed in selecting varieties suitable for this mode of culture. Some, of which *A. virens* may be given as an example, root so profusely and in such a manner that the roots are with difficulty induced to enter the material provided as a medium for them. *A. crispum* and *A. Lobbi* root in a totally different manner, and can be much more easily managed in pots; but in spite of this they are better in baskets than pots, for they delight in exposing their fleshy roots in the moist shady atmosphere with which they should be provided during the growing season. The roots of *A. virens* will often go straight through the basket in which it is grown and extend fully 4 feet below it. Plants

2 to 3 feet high have 60 to 70 feet of roots below the basket and are very healthy, while not a single root is to be found in the moss provided for sustaining moisture about the plants. The roots extend and branch freely in the atmosphere, and the plants flower well. If the roots of this variety and others of the same habit of growth are confined in pots they would quickly decay and the plants become unhealthy. The others represent those that make less but more fleshy roots and cling tenaciously to the basket, and the charcoal and moss in it soon becomes a mass of roots. Whether grown in pots or baskets make no attempt to force the plants to root only in the pot or basket. Very little material as a rooting medium is needed, and that should be composed of charcoal in lumps and sphagnum moss on the surface, which should be annually removed.

DENDROBIUM WARDIANUM.

Although this Orchid requires more shade than the majority of Dendrobiums it must not be overshadowed nor grown in too moist an atmosphere. Under these conditions pseudo-bulbs of a greater length are produced, but they lack the solidity necessary to insure a profusion of fine flowers. Pseudo-bulbs produced under such conditions seldom ripen satisfactorily, and they frequently display signs of damping during the period of rest. They succeed admirably in ainery where the roof is not overshadowed with foliage and where liberal supplies of air are admitted. By this method of culture the pseudo-bulbs are short-jointed and are solidified as they are made. Directly they show signs of having lengthened out their growth, which is easily detected by a small leaf at the extremity of the pseudo-bulb, they should have a cooler, drier, and more airy position. It is important that the change in their treatment be gradual and continued until they have lost their foliage and are perfectly firm. After the growth has lengthened one of the greatest mistakes that can be made in their culture is to suddenly withhold water and force them prematurely to rest. Although *D. Wardianum* requires liberal supplies of water during the growing season the plants must not have very much in the early stages of growth, or the leaves will decay at their points, as if they had been caught by the sun. The foliage under good treatment should remain healthy until the completion of growth and the process of ripening commences.—ORCHID GROWER.

ROYAL HORTICULTURAL SOCIETY.

JUNE 25TH.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters, in the chair; Messrs. McLachlan, Morris, Michael, Dr. Müller, and Rev. G. Henslow, Hon. Sec.

Rosa berberidifolia.—Dr. Masters further examined the anatomical structure of the stem and petiole of this exstipulate unifoliate species exhibited at the last meeting, and found that the fibro-vascular cords leading to the normal position of stipules were present, the stipules themselves being quite arrested. He commented upon the importance of extended observations on the anatomical structure of plants from a horticultural point of view, in that, for example, when the water cells are more abundant, the plant appears to be more liable to be attacked by mildew.

The Blight of Caterpillars.—Mr. McLachlan observed on the present superabundance of caterpillars that it is far less serious and much more local than is popularly supposed to be the case, some districts being apparently quite free from any excess. Remarks were made upon the popular errors associated with the vague term "blight," and the difficulty of persuading the unscientific world that plagues of various kinds of destructive animals had nothing whatever to do with atmospheric appearances of haze, &c.

Amorphophallus Titanum.—Dr. Masters exhibited drawings of, and Mr. Morris described this remarkable Aroid now flowering at Kew. It was received from Sumatra ten years ago, having been discovered by Dr. Beccari. The tuber weighed 56 lbs. at the beginning of this year, and grew at the rate of 4 inches a day. The spadix and stem together are 7 feet in height. The spathe was at first closely adpressed to the spadix, but on Friday morning, the 21st, it began to spread, and was fully expanded for one day only. By Saturday morning it again closed round the spadix. Like so many Aroids the odour was most offensive. The male flowers are situated low down in a ring, and doubtless pollinated the females which were below them. Flies were observed at the base, but whether they assisted in the fertilisation or were laying eggs in the spadix could not be determined.

Pyrethrum Attacked by Insects.—Dr. Müller showed specimens of leaves penetrated by a dipterous miner, probably a species of *Phytomyza*. It first appeared on the yellow *Soleil d'Or*, and thence spread to the red varieties. Mr. Morris compared its ravages with those of the *Ceniosoma coffeellum*, which has destroyed plantations in Ceylon and Dominica. The best way to destroy it was to pinch the leaves where the caterpillar was burrowing underneath.

Poa pratensis.—Dr. Masters showed specimens of this species of Grass, which were reported to be covered with a gummy exudation. It did not appear to be present on the dried specimens sent, but it was suggested it might have been honeydew.

Abies Nordmanniana.—Mr. Veitch sent a remarkable branch of this species with a large burr, with spreading branches of a yellowish hue. A discussion was raised as to the general cause or causes of such structures, and whether they were hereditary or could be propagated. The opinion entertained was that they were originally due to the puncture of some insect, but the difficulty lay in observing it at the time. Dr. Masters said he had on one occasion noticed a number of seedlings of Fir trees having such abnormal growths on the Simplon. It was proposed to subject the specimen to microscopic examination, and to test the powers of propagation. Varieties of *Clanbrazilian Firs* are known to be readily propagated which have thus originated.

Urtica dioica, monœcious.—Mr. Henslow exhibited specimens of the female plants of the common Stinging Nettle with male flowers at the extremities only of the female branches of the panicles, corroborating the generally received view that the occurrence of male organs is correlated with a reduced vigour.

LILIUM TENUIFOLIUM.

THE accompanying illustration (fig. 1), represents one of the most charming of all the Martagon group of *Liliums*. Its slender stem,

FIG. 1.—LILIUM TENUIFOLIUM.

never growing more than 13 inches high, is clothed to the ground with narrow leaves, and the flowers, which are bright scarlet, are about 1½ inch long. It is a wonder we do not more often see this bright coloured little gem. Like most of this group, *L. tenuifolium* does best planted out. A moist situation should be chosen, and if grown amongst some dwarf shrubs where it will get a little shelter in the early spring so much the better, as it is one of the earliest to bloom. It thrives best

in peat, and should be planted about 4 inches deep as soon as the bulbs can be procured in the autumn.—G.

NOTES ON HARDY FRUIT.

APPLES.—In but few instances will it be necessary to thin out the crops on trained trees. Most of the Codlin family, however, including Keswick, Carlisle, and Lord Suffield, are bearing freely, and these where at all thick ought to be lightly thinned, more, however, being gathered when the fruits are near the size of large Walnuts, at which age they can be used for cooking purposes. Any pyramid small standard and bush trees that have formed much growth should have this lightly thinned out, and if the trees are sufficiently fruitful the reserved shoots may be shortened back to a length of 9 or 12 inches, or according to their vigour. Vigorous trained trees closely pruned are rarely fruitful, and the simplest, as well as the best method of correcting this habit, is to leave a number of well-placed branches all over the tree unpruned both now and at the winter pruning. In most instances these will ripen well and form fruit buds at nearly every joint during the following summer. Espaliers, cordons, and fan-shaped trained trees should have foreright shoots shortened to about 6 inches in length, or rather less if at all weak. The leading shoots to be preserved to their full length and properly laid in.

PEARS.—The crops on wall trees are partial, and not much thinning out appears to be needed anywhere. Nor are many of the trees clear of walls heavily laden with fruit, large quantities being much injured by caterpillars. All well-established trees are growing vigorously, and the summer pruning ought now to be completed. These may be treated exactly in the same way as advised in the case of Apples generally. A spell of bright sunshine and clear weather has well hardened the early leading growths, and advantage should be taken of this in southern districts to secure a second pair of branches for young horizontally trained wall trees. Supposing two, and a leader have already been obtained, the latter should be shortened to about 12 inches in length, and from the shoots resulting a fresh leader and two well placed side branches may be laid in. If this is attended to at once the young shoots will have time to mature before the fall of leaf.

PLUMS.—Wall trees generally are bearing excellent crops, and another thinning out must be done at once, or the quality of the crop may be seriously impaired. The thinnings may be utilised for pies, and good preserve can also be made with them. All leading growths ought to be fastened to the walls or trellises, but those of a very rank character should either be cut cleanly out or stopped, a removal of a portion of the leaves also checking this unfortunate habit. Gross shoots unchecked soon disfigure a tree, these robbing their more weakly neighbours, and cause the trees to become unshapely. On some soils Plums frequently lose large branches, though perhaps not so suddenly as might appear to the superficial observer. When the foliage on a large branch assumes a glaucous hue, and no young shoots are formed on it, most probably it will be dead by this time next year. These losses should be anticipated (they cannot be prevented) as much as possible by laying in young shoots now to take their place. More also should be reserved to cover any bare portions of the main branches, and especially ought strong young shoots from near the base of the tree be taken good care of. All superfluous shoots to be pruned to a length of about 5 inches. It is also advisable to thin out branches on pyramid and bush trees; this insures the ripening of the reserved shoots, causes the formation of fruiting spurs, and benefits the fruit that may be hanging on the trees. The Plum aphid is very abundant this season, many trees being smothered by it. The ordinary green and black aphid or fly is also troublesome, and all must be destroyed as quickly as possible. After the trees have been pruned and the branches reserved laid in, all should have a thorough cleansing. A free use for several evenings in succession of either an engine or syringe and soapy water, or soft water well impregnated with soot, will do much towards clearing the trees of such pests. The soot mixes readily with water if first made into a paste, and is both objectionable to the insects and beneficial to the trees. If it is thought necessary to syringe the trees with a decoction of quassia chips, or tobacco water and soft soap, in each case freely diluted with water, it is advisable to syringe this off the fruit with clear water.

PEACHES AND NECTARINES.—Latterly these have made better progress, and most of the trees will perfect good crops. In many cases the fruit ought to be freely thinned out, one fruit to every 6 square inches of wall space being ample, in fact rather more than should be left on weakly trees. Foreright shoots ought to be cut well back, and only a moderate number laid in on the upper side of the fruiting branches. If not unduly crowded these shoots will ripen properly and flower freely next season. Continue removing any curled leaves, and if black fly is prevalent dust the affected points and leaves with tobacco powder. The engine or a syringe should be used on the trees in the evening of every hot day, soot water also being beneficial to these as well as to Plums. If mildew is prevalent coat the affected points with sulphur, and should red spider put in appearance mix sulphur freely with the syringing water. A handful to a three-gallon can is sufficient, and may be best mixed with the water by squeezing it through a muslin bag. It is a curious fact that best fruit always seem to swell close to the nails used with the shreds, and as contact with these is liable to much disfigure or spoil the fruit the nails ought to be shifted before the fruit commences the final swelling. Waterloo promises to be even earlier than the serviceable Hale's Early.

CHERRIES.—Birds are liable to clear off the fruit of these long before they are ripe, therefore complete the pruning, this being done much as advised in the case of Plums and net over early. Green fly and a larger species of black fly are very troublesome among Cherry trees, and these again must be kept down as previously advised if clean fine fruit is desired. As a rule the nets may be taken from the Strawberry beds in time to cover the Morello Cherries, and the latter are not so liable to become so dirty. Seeing the fruit is principally borne on wood formed during the next season, the young shoots must only be thinned out now.—W. IGGULDEN

THE NATIONAL CHRYSANTHEMUM SHOW AT HULL.

THE error in the numbering of some of the classes in the National Society's schedule to which your correspondent, "E. M.," has drawn attention is unfortunate, but any inconvenience will be obviated if intending exhibitors fill in their entries from the Hull Society's schedule, which is quite correct in the numbering of the classes. The National schedule is also not quite correct in the conditions of some of the cups. Here also the Hull schedule is to be taken as correct.—R. F. J.

NATIVE GUANO.

NATIVE guano and sewage are convertible terms, and the disposal of the latter has long been a question of embarrassment to parish authorities. Its right place is undoubtedly on the land, and how best to distribute it with safety to the public health is a subject of great public importance. On the occasion of the opening of the Native Guano Company's works at Kingston for disposing of the sewage of that town and of Surbiton by their A B C process, the Mayor of Kingston (Mr. Alderman East) said that there were two or three ways of disposing of town sewage: (1) By transferring it to their neighbours; (2) by disposing of it on their own land; (3) by running it into the river. To the first course there was the objection that their neighbours usually had sewage of their own to deal with, and would by no means undertake the responsibility of more. To the second, that where town land was scarce and quite close, as it were, to the market place, sewage, for obvious reasons, could only be applied with great caution. To the third, that the river conservators refused its admission until it had been reduced to an inoffensive state. The Corporation had, he said, been embarrassed by this question of sewage disposal for many years, and after the most careful consideration they had come to the conclusion that the Native Guano Company's process of resolving sewage into an easily applicable and inoffensive manure, leaving a harmless effluent to escape into the river, was the best means of solving the difficulty, and had come to an arrangement with them accordingly.

The Worshipful Mayor's remarks were made at a lunch on the works on Saturday last, previous to which a large company of experts had inspected the process from its preliminary to its final stages. The method of converting raw sewage into an odourless fertiliser is ingenious and highly interesting. In the first place, after passing through a grating, it flows into a pump well beneath the main building, and the deodorising mixture is there applied. Centrifugal pumps lift and discharge it into a meter chamber, whence it flows into open channels in the grounds, precipitating agents being applied on the way. These channels conduct it to the settling tanks, which are eight in number. They are 85 feet long by 50 feet wide, and about 8 feet deep, and have a holding capacity of 1,200,000 gallons. The tanks are arranged in pairs, with a dividing wall, which does not, however, extend to the further extremity, but leaves an opening several feet long. Flowing from the channels above referred to into the first tank, the sewage passes through it, settling as it goes, and passes round the end of the wall into the second tank, where further settling takes place, and the surface water flows out through a floating apparatus and escapes into a channel lower down, whence it passes through a covered channel to the river. This effluent is quite clear and odourless.

The deposit left after the surface liquid has escaped is pumped from the tanks into what is known as the sludge well, where further applications are made to it, and from there it is transferred to an upper floor of the main building, and forced by air pressure into filter presses, which press the remaining moisture from it. Removed from the presses, it is thrown into a heap to dry, and then passed through a cylinder into a disintegrator, where it is powdered and passes out ready for use.

When placed in sacks ready for being dispatched for use on farms and gardens the native guano resembles coarse soot, hence is in a form that renders it easily and conveniently applicable to the soil. Many good gardeners speak highly of it, and it is essentially a safe fertiliser for farm and garden crops generally, also for lawns and flower gardens. The process by which the Native Guano Company evolve it from town sewage is entirely inoffensive; in fact, while the works were in full operation on Saturday last, which was a very hot day, no inconvenience was experienced by the visitors who inspected them, much less by the

inhabitants of the adjoining town of Kingston. Here, then, the sewage question is solved in a practical manner, with safety to the public and advantage to the soil. It ought to be considered elsewhere, for millions of pounds are wasted when the greater portion of the sewage of a nation is consigned to the sea.

EVENTS OF THE WEEK.—To-day (Thursday) there will be shows (chiefly Roses) at Bath, Canterbury, Hitchin, Chertsey, Norwich, and Wanstead. The National Rose Society's Metropolitan Show will be held at the Crystal Palace, Sydenham, on Saturday, July 6th, when a good display may be expected, though the season has been a trying one, and rosarians are complaining that they cannot count on a long continuance of bloom supplies. The Royal Horticultural Society's Fruit and Floral Committees will meet at Chiswick on Tuesday, July 9th, when the Chiswick Horticultural Society will also hold their annual show in the same gardens. There will be Rose Shows at Brockham, Diss, and Hereford on the same date. On Wednesday, July 10th, the Teddington Horticultural Society will hold their summer Show in the grounds attached to The Grove, and there will be Rose Shows at Brighton, Dursley, Ealing, Ipswich, and Tunbridge Wells.

THE WEATHER.—The weather in the south during the past few days has been cooler than it was towards the close of last week. Mr. Molyneux informs us that the shade thermometer registered 90° on Friday (June 28th) at Swanmore, Hants. Rain is much needed by growing or languishing crops.

TO CONTRIBUTORS.—In consequence of the space occupied by the index to the last half-year's volume and reports of Rose shows, the publication of several articles in hand are deferred to a future issue.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are requested to state that the amount collected by Mr. Crawford, Codrington Hall, Newark-on-Trent, in aid of the Jubilee Fund of this Institution, exceeded £40.

MESSRS. KELWAY & SON, Langport, who exhibited a bank of Herbaceous Pæonies, Delphiniums, Pyrethrums, and Gaillardias at the Paris Exhibition, from the 21st to the 27th of June, have been notified by Count Horace de Choiseul, President of the Jury, that a first prize has been awarded to them for their collection of cut flowers.

PEACHES BY POST.—"A Cornishman" will be obliged if those of our readers who are in the habit of sending Peaches by parcels post will inform him of their method of packing, and where he can obtain the most suitable boxes.

A FLORIFEROUS AZALEA.—This designation may be fairly applied to a fine specimen of the old *A. indica alba* which I recently observed in Mr. Prewitt's nursery at Hammersmith. The plant in question was in a 20-inch pot, and had borne 150 dozen blooms.—J. B.

ROSES AND CHRYSANTHEMUMS.—A Cheshire reader desires to know which of the above flowers are represented by the greater number of varieties and colours. We imagine Roses are the more numerous, but have not time to count, and as some of our readers may have the desired information at their fingers' ends, they will perhaps oblige our correspondent by imparting it.

IN our report of the York Show last week the awards in the class for ten varieties of fruits should have been—Mr. McIndoe, first; Mr. J. Edmonds, gardener to the Duke of St. Albans, and Mr. Dawes, gardener to The Hon. Mrs. Meynell Ingram, equal second; and Mr. Blair, Trentham, fourth. The Fête was a great pecuniary success, the receipts amounting to £1431 18s. 6d.

STRAWBERRIES.—At page 512 I observe "W. D. S." mentions Garibaldi. Are we to infer from what he says that the variety he mentions is distinct from Vicomtesse Hericart de Thury? I grow a few plants of both. I prefer Garibaldi. I observe it is ripening its fruit earlier than the Vicomtesse. The first ripe fruit from the former was gathered six days earlier than from latter.—W. T.

THE collection referred to in this Journal as that of ITALIAN

PLANTS AT OXFORD I have seen within the past month. It is the one containing the MS. notes formerly attributed to Dillenius, the contemporary of Linnaeus, and Sherard, from the latter of whom the professorship of botany at the Oxford University derives its title. The volume bears on its outside front cover some observations relating to its perfect condition when examined by a former famed curator of the garden, the author of "Baxter's British Flowering Plants," in whose handwriting they are made above his signature.—G.

LEEDS PAXTON SOCIETY.—At a largely attended meeting of the Society, held on the 22nd ult., Mr. Joseph Smith was presented with a portrait of himself, subscribed for by the members, as a token of respect and appreciation of valuable services, rendered by him as President during the past three years. The presentation was made by Mr. W. Grix, the Chairman, in appropriate terms, and was suitably acknowledged by the recipient. An illuminated tablet at the foot of the portrait bears the inscription, "Presented to Mr. Joseph Smith by members of the Leeds Paxton Society, in recognition of his services as President for the last three years, June 22nd, 1889."

MR. R. GILBERT sends us from Burghley a box of very fine STRAWBERRIES. The varieties are A. F. Barron, Burghley President, Sir Joseph Paxton, and Aberdeen Favourite. The last named is by far the richest in flavour, indeed of first class quality, though Burghley President is very good. A. F. Barron possesses much of the briskness of Sir Joseph Paxton. On page 520 last week we remarked, "It would be interesting to know if A. F. Barron grows freely at Burghley." As Mr. Gilbert is silent on the point, we add that it neither grows well in the somewhat heavy soil at Chiswick nor the light sandy soil at Girtford, and if it is not more satisfactory elsewhere we are bound to doubt if it is worthy of the name it bears.

FRUIT PROSPECTS.—The abundance of blossom on nearly every kind of fruit tree, which gave a hope of a good crop of fruit generally, is not now likely to be realised. The absence of frost in the month of May and the otherwise genial weather during that period helped to develop the blossom considerably, the result being a good set all round; but the dry weather setting in—for we have had but one shower for six weeks, accompanied with an unusually high temperature—caused most of the fruit to fall. Apples and Pears are about a third of a crop. Plums of the Victoria type are the only sorts generally well cropped. Green Gages on wall trees are also good, but out in the open very poor. Others have nearly all fallen. Cherries of the Bigarreau kind are thin, other sorts very fair. Apricots very poor. Peaches very fair at present, but as the stoning process is now going on many fruits may fail to swell. The only satisfactory crops are Strawberries, Gooseberries, Raspberries, White and Red Currants. Black Currants set well, but owing to the drought the fruit will be small and poor in quality. Figs show a good crop, especially upon those trees allowed freedom in growth, while trained trees the fruit is larger but very thin. Should the dry weather continue a much lower estimate will have to be taken at the end of the season, for with a little wind I see the fruit is still falling.—THOMAS RECORD, *Folkington Manor, Sussex.*

THE GARDENERS' ORPHAN FUND.—The usual monthly meeting of the Committee took place at the Caledonian Hotel, Adelphi, on the 25th inst., Mr. George Deal presiding. The minutes of the last meeting having been read, the Hon. Secretary reported that the last two investments of £500 each had been effected, the total sum in the funds being £2500. The report of the Sub-Committee, proposing an addition to Rule 12, bearing on the mode of election, was passed. The details of the coming election and annual dinner on July 19th were considered, and special Committees appointed to carry out the same. Mr. F. Q. Lane, Berkhamstead, and Mr. George Gordon, Gunnersbury, were elected upon the Committee in the place of Mr. C. Howe, late of Benham Park, deceased; and Mr. H. Williams of Holloway, who has resigned through press of business. The Hon. Secretary reported that the income of the Fund from all sources during the last financial year just closed amounted in round numbers to about £2000. Of this sum nearly £350 was in the form of annual subscriptions; £900 or so as donations; £260 from local secretaries; £45 as interest; and £400 from miscellaneous sources, including the Covent Garden Fête. A cheque was ordered to be drawn for the sum £35 15s., the quarter's allowances to the children who are upon the Fund. It may be again mentioned that the annual dinner and election of children on the Fund takes place at Cannon Street Hotel on Friday, July 19th. The election commences at 2 P.M., and the dinner will be held at 5 P.M. Sir Julian Goldsmid, Bart., M.P., the President, takes the chair at the dinner, and

the Committee are desirous he should be largely supported on this occasion.

— SEVERAL recent consular reports upon the agriculture of San Francisco and its neighbourhood give considerable prominence to the ravages of a NEW VINE DISEASE. First noticed in 1887, it has spread steadily, and last year several whole vineyards were destroyed. Experts have completely failed to identify it, so that there can be little doubt that it is really new. The course it runs is short. The young leaves of the affected Vines turn yellow and drop off when the young branches have acquired a growth of 1 to 3 feet. No cure or preventive has yet been found, and the epidemic bids fair to be as disastrous to American Vine growers as the phylloxera was to those of France. The Californian Orange orchards are not in a much better plight. The white cotton scale, as it is called, has killed grove after grove of vigorous trees. This pest is familiar enough. There have been outbreaks of it in Australia, but it is said to be all but extinct now, thanks to the action of a parasite. Consignments of this useful and somewhat peculiar medicine are arriving at San Francisco. Some planters have resorted to an extraordinary device for killing the grubs. It is to cover each tree with a tent, and then brew some prussic acid inside, which kills the grubs and eggs, but does not damage the tree. It is to be hoped the method may prove generally successful. The climate of California and the Pacific States generally is perhaps the best in the world for fruit-growing, but it is getting an unenviable notoriety for new diseases.—(*Daily News*.)

CANKER IN FRUIT TREES.

IN reply to "W.," page 434, whatever other readers of the Journal may say on the subject, I must confess that so far as I am concerned I have had "too much canker." I have wasted too much time writing on the subject, not that I regret my researches and experiments, and the treatment I have advocated. If I have any friends to the insect theory in the Journal they must be very quiet ones, for, so far as my memory carries me, the only friend to the same view was Mr. Harrison Weir some years ago, and we were working and writing pretty much the same, quite independent of each other's movements. So long as the controversy is carried on with the same good feeling I will endeavour to crack "W.'s" nuts, however hard the shells may appear. I know I am commencing a difficult task in attempting to adequately reply to the forcible and excellent article on page 434. If I could forget my experiments and experience I would not waste a moment in replying.

Mr. Tonks is quite able to take care of his theory without my interference. My experience on the point is that many trees can be restored to a fairly satisfactory condition by stimulating to new growth and vigour by the addition of fresh soil to the roots, or by top-dressing with manure, but that canker is not permanently cured, although a cankered place may grow up, as fig. 70 is represented to be approaching—and I have many specimens quite grown over—my contention is that unless certain insect life is destroyed canker will break out again at other points on the tree, whither they move and take up a fresh abode, and in time produce a canker.

It may be I shall be considered dogmatical to adhere to my conviction. When Jack Frost asserts his power, and "bites" here a branch and there a branch, as represented in the Impney specimens, and causes "chilblains" on the trees that I consider cured on the insect theory, then I will honestly acknowledge my mistake. Six or seven years of working and watching have altered my opinion on some points, and one of "W.'s" "nuts," I confess, I have had to give up—viz., that insects only attack certain sorts, or those they like best. I have had to give up that opinion on some of the worst known sorts for cankering, that of Dumelow's Seedling, Ribston Pippin, and Hawthornden. My present idea is derived from practical experiments since I held the opinion that insects preferred certain sorts, which I believe was written some years ago.

Here is a case in point. About six years ago I grafted a Dumelow's Seedling on a Hawthornden stock, which was cankered half way through, worse than is represented in fig. 70, the trunk being about 2 inches in diameter. This was cut back to within a foot of the ground, and I took particular care that every particle of the remaining stock below the grafts was enveloped in limewash and a strong insecticide, so that the infested part, if any insects still remained, were entombed. The scions were from a healthy tree, and were carefully examined, and no insects appeared to be on them. That tree is now the healthiest in my garden, and has never shown a symptom of canker since, and frost has been very merciful to it ever since, although the sappiest and worst ripened wood on the premises often retaining its growing leaves into November. I hope "W." will crack that nut on the "frost bite" theory. That tree is worth photographing as a comparison to the hundreds of acres of orcharding eaten up by "blight." Another case: I have a Ribston Pippin grafted on a stock raised from seed about seven years old. When I was about to graft it I had my doubts about taking scions from an old cankered orchard tree, but as I had no other I took the precaution to get my magnifying glass, and found a quantity of insects on it. These I carefully removed, and to make sure that none escaped, the scion was encased in limewash and an insecticide. The tree grew, and is as healthy as can be, and unless any communication

with other trees on which insects are established takes place, I have faith that it will remain healthy, while young wood on the old tree still cankers.

Now, another nut for "W." to crack. If the frost bit two of Dr. Hogg's Dumelow's Seedlings in a row of three trees, why did the other escape? Was it wrapped up? Will anyone find a cankered tree without the same species of insect appearing?—J. HAM.

TOMATOES AT FOXHOLES, HITCHIN.

IN looking through the gardens and glass houses belonging to Mr. Tindal Lucas my attention was called to a grand house of Tomatoes. Mr. Sheppard, the head gardener, informed me the variety was Sutton's First Crop. The seeds were sown in the first week of January, and when the plants were strong enough they were planted in shallow boxes and stood along the front of one of Newton's new patent houses, just over the pipes, and in the full light. They are trained up wires in the same way as Vines are usually trained, the one-stem system being practised. The plants are not more than 6 or 8 inches apart, and about the same distance from the glass. Ripe fruit was taken about the 1st of April, and a constant supply has been maintained till the present time. The fruit hangs like ropes of Onions, and fine fruit too. Mr. Lucas is justly proud of his success. Whether to give the credit to the variety, the house, or the gardener, I do not know, but from what can be seen of the gardens generally I think there is some praise due to Mr. Lucas for the confidence he places in his gardener, and also to the latter for the pains he takes to carry out his employer's wishes. There are other notable features of gardening at Foxholes, but I will not trespass on your space in describing them now.—G. MERRITT.

A GIGANTIC AROID.

ALTHOUGH numerous members of the great and peculiar family of Aroid plants are cultivated in British gardens there are others that are unknown to horticulturists, or not valued from a decorative point of view, yet possessing much interest for botanists and all who are concerned with the peculiarities of the vegetable world. As botanical studies the whole of the Aroids are interesting in somewhat more than an ordinary degree, and though the remarkable fœtid odours exhaled by the inflorescence of many species renders them the reverse of favourites for cultural purposes, still it must be admitted that a plant like the *Richardia æthiopica*, now so extensively grown, possesses a distinctness of habit, an elegance of foliage and boldness of floral characters, that amply entitle it to its present popularity. That, however, is almost the only member of the family generally grown, though a few others are represented in gardens and houses.

Visitors to the Royal Gardens, Kew, have for some time been familiar with two pictorial representations of giant Aroids, one of these being in the gallery of paintings contributed by Miss North, and the other in the museum near the main entrance at Kew Green. The first depicts *Amorphophallus campanulatus* as seen in its native home—Java—where it produces a single enormous leafstalk surmounted by a divided leaf, and rising from the root a huge somewhat bell-shaped spathe. It is said that previous to the bursting of the spathe, which takes place suddenly about sunset, there is an accumulation of heat therein. When it opens it exhales an offensive odour that is quite overpowering, and so much resembles that of carrion that flies cover the club of the spade with their eggs. In the rise of temperature noticed this *Amorphophallus* is not exceptional, as the same peculiar phenomenon has been observed in other members of the same family, while in attracting flies *Stapelia* (commonly known as Carrion Flowers) have a precisely similar influence.

The other representation is that of *Amorphophallus* or *Conophallus* *Titanum*, which placed on the ceiling of the Wood Museum has attracted much attention, and created no little astonishment for several years. This shares several characters of *A. campanulatus* just noted, but on a magnified scale. It has a single tall leafstalk with its strange snake-like markings, and a great divided leaf blade at the apex, and a huge spathe and spadix, but all of enormous proportions, truly gigantic in comparison with its relations generally, and meriting the title with which it has been distinguished. The plant was discovered by Signor Beccari in Sumatra, who furnished drawings, and the Marquis Corsi Salviati was the means of calling attention to them in this country. Tubers were sent to Kew in 1879, and the production of the immense leaf created some sensation in succeeding seasons, forming a prominent object in the Victoria Lily house. This year, however, the interest already created in the plant has been considerably increased by the production of its spathe, but though many watched its development few saw it when it was fully open, and its duration was short in that stage. The spathe and stem attained the height of 7 feet, having in the latter part of the time grown at the rate of 4 inches a day. The spathe commenced expanding on Friday morning, June 21st, and when at its largest

it was 4 feet in diameter, green externally at the base, and white at the upper part, the inner surface being a dark purple, the total length of the spadix 5 feet, diameter 10 inches, and the colour a

pollen was produced, and it is expected that seeds will be formed. At the meeting of the Royal Horticultural Society's Scientific Committee on June 25th Mr. D. Morris of Kew furnished some particulars respect-

FIG. 2.—AMORPHOPHALLUS TITANUM.

deep yellow when mature. During Friday the odour emitted from the spathe was most offensive and powerful, and was compared to that of decaying fish, but it lasted a very short time, for when the spathe began closing on the following day it had greatly decreased. A quantity of

ing the plant, which will be found on page 3 of this issue, but the principal facts have been embodied in this notice.

The illustration (fig. 2) gives a representation of the plant as it was growing in the Victoria house at Kew.

A TERM of rainless days and almost dewless nights, with bright sun and a high temperature, induced Roses to expand rapidly, and it soon became apparent that the societies which had chosen the earliest dates for their shows were likely to have the best chance of good displays. Exhibitors must even during the past week have found it difficult to cut blooms that might be expected to be in their best condition by the time the Judges commenced their duties. Fresh young buds that had only commenced developing at 4 A.M. were fully expanded on the plant by 9 or 10 A.M., and scarcely much better when cut and placed in a cool room. Under these circumstances a short Rose exhibition season can only be counted upon, unless there is a speedy change in the weather.

OXFORD.—JUNE 25TH.

THE June Show of the Royal Oxfordshire Horticultural Society always falls upon one day of the commemoration at the University, and it is therefore a part of the week's festivities. The Exhibition took place in the charming grounds of Trinity College, where there is an avenue of Limes, said to be 200 years old. Cut Roses were a great feature, and some superb blooms were shown. Several classes were open to all comers, and in that for twenty-four triplets there was a good competition, Mr. George Prince, Oxford, being placed first with very fine blooms indeed, mainly composed of Teas and Noisettes, the leading varieties being Edith Gifford, Grace Darling, Viscountess Folkestone, Marie Van Houtte, Anna Ollivier, Alba Rosca, Jean Ducher, Innocente Pirola, Amazone, Princess of Wales, Souvenir d'Elise Vardon, Catherine Mermet, Madame Cusin, Niphotos, Lady Mary Fitzwilliam, Comtesse de Nadaillac, Jean Pernet, Madame Caroline Kuster, and a few Hybrid Perpetuals. Dr. S. P. Budd, of Bath, was second, showing some very fine blooms, including Marie Verdier, A. K. Williams (in superb form), Madame G. Luizet, Ulrich Brunner, François Michelin, Le Havre, Violette Brougere, Alfred Colomb, Madame Eugénie Verdier, Etienne Levet, Edith Gifford, Anna Ollivier, Dupuy Jamain, and Merveille de Lyon. Third Messrs. George Cooling & Son, Bath, who had some very good flowers. In the class for twenty-four blooms Mr. J. Matloek, Headington Hill, Oxford, was first with very good examples, his leading flowers being La France, Ulrich Brunner, Lady Mary Fitzwilliam, Marie Baumann, Marie Verdier, Innocente Pirola, Jean Ducher, François Kruger, Madame C. Kuster, Catherine Mermet, La Boule d'Or, Amazone, Baron de Bonstetten, &c. Second, Dr. Bywater Ward, Warneford Asylum, with La France, Louis Van Houtte, Marie Baumann, Victor Verdier, Duchesse de Vallambrosa, Madame Lacharme, Jean Ducher, Duchess of Bedford, Auguste Rigotard, Souvenir d'Elise, &c. Third, Messrs. G. Cooling & Son. In the class for twelve blooms Messrs. Geo. Cooling & Sons were first with Merveille de Lyon, A. K. Williams, Magna Charta, Jean Ducher, Marie Verdier, Star of Waltham, Countess of Oxford, and Mrs. John Laing. Second Mr. A. Evans, Marston, Oxford. In the members' classes for twenty-four and eighteen varieties Mr. S. P. Budd was first in both cases. Mr. J. Walker, nurseryman, Thame, was second with twenty-four; and Mr. John Saunders, Headington, second with eighteen. The varieties shown were in the main duplicates of those already named.

Plants, fruit, and vegetables were also exhibited, but we are compelled to omit the report of them this week.

RICHMOND.—JUNE 26TH.

THE Richmond Society was fortunate in their date as far as the Roses were concerned, for the classes were well filled, and though good exhibitions of these flowers have been held there before they were surpassed on the last occasion. Indeed, it was specially stated that the entries exceeded the total of the past four shows together. Over sixty stands were staged, as many as eight competitors with thirty-six trebles and nine with twenty-four trebles entered, and in the smaller classes there were ten to twelve competitors. In several of the classes the exhibits were of very even merit, and in the stands of thirty-six some grand blooms were shown, though all appeared to have found a difficulty in making up the full number. Yet taken altogether it was one of the best June Rose Shows we remember to have seen.

With thirty-six trebles Mr. B. R. Cant was placed first with a superbly fresh lot of flowers; A. K. Williams, Dr. André, Duke of Edinburgh, Marie Baumann, Madame Cusin, Marshal Wilder, Elise Vardon, Niphotos, and Merveille de Lyon were very beautiful. Messrs. Paul & Son, Cheshunt, came second with some grand flowers, Madame A. Lavallé, Etoile de Lyon, Mrs. John Laing, Perle des Jardins, Marie Baumann, Marie Rady, and Her Majesty were exceptionally good. Mr. F. Cant of Colchester was third. In the class for twenty-four trebles, however, the latter exhibitor was placed first with handsome blooms, including The Bride, Madame Gabriel Luizet, La France, Madame de Watteville, &c. Mr. B. R. Cant was second, and Messrs. Paul & Son third. In the amateurs' classes the Rev. J. H. Pemberton, Havering, Essex, was first with twenty-four singles, Mr. R. E. West of Reigate coming second; whilst in the class for twelve blooms the same order was observed. All those flowers were very fresh and pleasing. Messrs. Jas. Veitch & Sons

showed a fine collection of cut Roses, not for competition, having specially fine blooms of Bennett's Her Majesty, which is now fast developing into an admirable exhibition Rose.

WINCHESTER.—JUNE 27TH.

THE Winchester Horticultural Society held their sixth annual Rose Show in the Guildhall on the date named, and was a decided success, exhibitors coming from ten counties. The blooms, though not large, were fresh and of good quality. The above remarks apply mainly to the Hybrid Perpetuals. Tea Roses were excellent, the blooms being large, of good form, and very fresh. It would be difficult to conceive a finer stand than that which gained for the Rev. A. Foster Melliar, Sproughton Rectory, Ipswich, the first prize for twelve Teas or Noisettes. Souvenir d'Elise in this stand was awarded the National Rose Society's silver medal for the premier Tea or Noisette in the amateurs' classes. It was a bloom to be remembered by its freshness and form.

The principal class was for forty-eight, distinct, single trusses, for which three lots were staged. Messrs. Harkness, nurserymen, Bedale, Yorkshire, were distinctly first, the blooms being generally of good size, finely coloured, and very fresh. The varieties consisted of Ulrich Brunner, large and rich; La France, Alphonse Souper, Eugénie Verdier, Madame J. Debois, a very pale blush lilac, large and fine; Marie Verdier, Capitaine Christy, Madame Mussett, Alfred Dumesnil, very fine; Mons. Noman, full; A. K. Williams, perfect in form; Lady Mary Fitzwilliam, Général Jacqueminot, rich; M. L. Dickson, Charles Lefebvre, Pride of Waltham, Duchess of Edinburgh, Prince Camille de Rohan, Jean Ducher, Constantine Tretiakoff, fine; Madame de Watteville, Horace Vernet, Souvenir d'Elise Vardon, Marquise de Castellane, Merveille de Lyon, Harrison Weir, Mrs. J. Laing, fresh and good; Queen of Queens, Marie Baumann, fine in form; Souvenir d'un Ami, Antoine Ducher, Marie Rady, Maréchal Niel, Duchess of Bedford, Silver Queen, Madame Cusin, Boieldieu, very full; Dr. Andry, Innocente Pirola, Heinrich Schultheis, Catherine Mermet, Crown Prince, good; Marie Van Houtte, Le Havre, Gloire de Bourg la Reine, Madame Gabriel Luizet, and two unnamed varieties. Mr. F. Cant, Colchester was second, the blooms smaller yet fresh. Her Majesty, Horace Vernet, Star of Waltham, Dupuy Jamain, and Charles Lefebvre were among the best blooms. Mr. B. R. Cant, Colchester, was third with fresh small blooms.

For twenty-four distinct varieties, triplets, four competed, producing a good display. Mr. F. Cant was placed first with good and fresh blooms, especially of Her Majesty, François Michelin, Madame de Watteville, Innocente Pirola, Marie Baumann, Marie Cointet, and Mons. Noman. Messrs. Cooling, Bath, were second, and Messrs. Keynes, Williams & Co., Salisbury, third.

For eighteen Teas or Noisettes, distinct, four competed, making a fine display. Mr. Frank Cant was a good first with a fine stand of fresh, well-formed blooms of Madame de Watteville, Niphotos, fine; Madame Cusin, richly coloured; Souvenir d'Elise, full; The Bride, Innocente Pirola, extra; Ye Primrose Dame, a lovely lemon shade in the centre of the bloom; Madame H. Jamain, Souvenir de Paul Neyron, Comtesse de Nadaillac, good; Catherine Mermet, deep; Marie Van Houtte, Miss Ethel Brownlow, a finely formed deep pink variety; Madame Margottin, Jean Ducher, Madame Scipion Cochet, Francisca Kruger, centre golden orange, with pale outer petals, very fine; and Madame C. Kuster. Second, Mr. B. R. Cant, with smaller and thinner blooms, the best being Souvenir d'un Ami, Comtesse de Nadaillac, and Miss Ethel Brownlow. Messrs. Keynes & Co., third.

Four staged in the class for twelve trebles, Teas or Noisettes, the best coming from Mr. F. Cant, which were fresh and of good form; Madame Cusin, extra; Madame Watteville, Jean Ducher, Francisca Kruger, and Comtesse de Nadaillac were the best blooms. Second, Mr. B. R. Cant; third, Messrs. Keynes.

For twelve blooms of any one dark variety of Hybrid Perpetual five competitors staged. Mr. B. R. Cant led the way with Ulrich Brunner, of good colour, and fresh, though small. Messrs. Keynes & Co. were second with Alfred Colomb, uneven both in size and colour. The third prize card was missing. Not a good class. For the same number of any one light variety of H.P., six staged, making a good show; Lady Mary Fitzwilliam in good condition won for Messrs. Keynes first honours, Messrs. Cooling & Son being second with Mrs. J. Laing. Madame Gabriel Luizet was third, the name of the exhibitor being omitted. Two splendid boxes of Madame Watteville were staged by Messrs. F. and B. R. Cant for twelve of any variety of Tea or Noisette, the prizes going in the order named.

In the class for twenty-four distinct Roses there were five competitors, Messrs. Keynes leading the way with a good stand, the best being François Michelin, Lady Mary Fitzwilliam, Mons. E. Y. Teas and Victor Hugo. Messrs. Cooling were second with blooms a trifle smaller; Alfred Slaughter, Esq., Jarvis Villa, Steyning, being third with larger blooms, but many of them at least a day too old.

The following classes were not open to nurserymen:—For twenty-four distinct, single trusses, there were six competitors. Here Mr. Slaughter led the way with large, full and fresh specimens, very rich in colour, the best being Ulrich Brunner, Marie Rady, Etienne Levet, Dr. Andry, Alfred Colomb, Mrs. Jowett, and Innocente Pirola. Mr. G. Campbell, gardener to S. P. Budd, Esq., 8, Gay Street, Bath, was second with smaller blooms although good in quality, the Rev. A. Foster Melliar third, also staging well.

Twelve distinct trebles were staged by four competitors, the best, fresh well formed blooms, by Mr. Campbell. Ulrich Brunner here again

showed conspicuously. Second, the Rev. A. Foster Melliar, equal third prizes going to Mr. Slaughter and M. F. Flight, Cornstiles, Twyford, Winchester.

In the class for twelve distinct trusses, Teas or Noisettes, seven competed. Decidedly the best were staged by the Rev. A. Foster Melliar. Souvenir d'Elise, previously noted, Princess of Wales, Comtesse de Nadaillac, La Boule d'Or, and The Bride were especially noticeable on account of their great excellence. The Rev. F. R. Burnside, Much Birch Vicarage, Herts, and Mr. Campbell were second and third respectively with excellent stands. The Rev. A. Foster Melliar took leading honours in the class for twelve blooms, half to be Tea or Noisettes and the remainder Hybrid Perpetual amongst eight others, second and third prizes being awarded to Captain John Ramsey, Fareham, and Mr. Slaughter in the order named. For six trebles, distinct, Teas or Noisettes, five entered the lists, the best coming from the Rev. F. R. Burnside, medium in size, full and fresh, Innocente Pirola was especially fine. Mr. Slaughter second and the Rev. A. Foster Melliar third. The class for twelve distinct single trusses brought out some new exhibitors. The first prize stand from J. T. Strange, Esq., Aldermaston, Berks, contained the best bloom in the Show of *Maréchal Niel*, which was rich in colour. Ulrich Brunner was here again conspicuous. P. P. C. Burnand, Esq., May Park, Reigate, was second, and D. Seaton, Esq., Rutland Lodge, Bitterne, third. Mr. J. Kaines, The Cedars, Park Road, and Mr. H. Owen, Church Lane, Basingstoke, showed well in the amateur class.

The silver medal of the National Rose Society for the best Hybrid Perpetual in the classes confined to other than nurserymen was awarded to Marie Rady, a well-formed bloom in Mr. Slaughter's stand. Mr. G. Hillier, nurseryman, staged three boxes of blooms not for competition of leading varieties.

To add variety to the Show prizes were offered for miscellaneous exhibits, the leading features being twelve bunches of stove and greenhouse cut blooms staged by Mr. Budd, gardener to F. Dalgety, Esq., Lockerby Hall, Romsey. Mr. Flight and Mr. C. Shenton, The Glen, Golden Common, Winchester, staged good exhibits of hardy cut flowers, the prizes going in the order named. Mr. Budd had the best table plants—a clean lot. Mr. Hillier staged a good group of plants not for competition. From Mr. B. Ladhams, florist, Shirley, Southampton, came an interesting collection of cut blooms of hardy herbaceous plants. Mr. E. King, florist, Pennington, Lymington, Hants, showed some excellent double Begonias in pots; Mrs. King (orange scarlet, very double, and large) was the best amongst many others; it is a new variety, deep pink in colour, very large, the petals being heavily fringed, which gives to the flower a novel yet striking appearance.

FARNINGHAM.—JUNE 27TH.

It was perhaps in one sense unfortunate that the Farningham Show had been fixed for the same date as Winchester, for the latter being the more important of the two it was natural that many growers would send their best flowers there rather than to Farningham, and this was in effect the case. We missed some professional exhibitors whom we have been in the habit of seeing at this charming little Show, while some of those who were there had confessedly sent their best flowers elsewhere. On the other hand, it was fortunate for them that they had fixed so early a date, for as the neighbourhood is an early one those in the district would have been quite excluded had the Show been held at the usual time, for as the unexpected always happens, so it has been this year in Roses. Who would ever have expected in March that we should have reverted back to the days before 1879, from which time I have always maintained we have been in a cycle of late seasons, and perhaps we shall now have to encounter a series of early ones.

We missed, too, some of those exhibitors who used to make the Farningham remarkable for its finished blooms. Especially did we regret the absence of Mr. W. H. Wakley, whose Roses one always liked to linger over, and Mrs. Fuller, whose neatly arranged boxes of excellent blooms were always a joy to visitors, but a terror to her competitors; and others, too, were absent from one cause or another. Doubtless the intense heat of the season had something to do with it, for I heard of a small exhibition where there was only one class for twelve there were fifteen entries and only two came to the front. And now for the brighter side. There were some excellent stands exhibited, more especially in Teas, the boxes of Mr. Geo. Prince of Oxford and the Rev. F. A. Burnside being particularly good, while the decorations were both numerous and attractive. The day was magnificent, and the pretty village with its famous trout stream looked its very best.

The class for nurserymen was done away with, and the premier class was for thirty-six blooms, was open to amateur and professional growers, the first prize being awarded to Mr. R. E. West for an excellent stand of the following flowers—*La France*, *François Michelin*, *Madame Gabriel Luizet*, *Marie Baumann*, *Marie Finger*, *Pierre Notting*, *Abel Carrière*, *Beauty of Waltham*, *Comtesse d'Oxford*, *Mrs. George Dickson*, shown as no one else seems to be able to show it; *Prince Arthur*, *Baronne de Rothschild*, *Madame Victor Verdier*, *Général Jacqueminot*, *Merveille de Lyon*, *A. K. Williams*, *Mrs. John Laing*, *Madame Lacharme*, *Ulrich Brunner*, *Comtesse de Nadaillac*, *Comtesse de Serenye*, *Hon. Edith Gifford*, *Mons. Noman*, *Heinrich Schultheis*, *Victor Verdier*, clear, very bright; *Eugène Fürst*, *Marquise de Castellane*, *Le Havre*, *Marie Rady*, *Captain Christy*, *E. Y. Teas*, *Duchesse de Vallambrosa*. Mr. Geo. Prince was second, Messrs. Geo. Bunyard & Co. third, and Colonel Pitt fourth. In Class 2, for twelve Teas or Noisettes, Mr. Geo. Prince of Oxford was first with beautiful blooms of *Comtesse de*

Nadaillac, *Niphetos*, *Souvenir d'un Ami*, *Souvenir d'Elise Vardon*, *Madame Caroline Kuster*, *Prince of Wales*, *Innocente Pirola*, *Madame Cusin*, *Hon. Edith Gifford*, *Etoile de Lyon*, *Jean Ducher*, and *Amazone*. The Rev. F. R. Burnside was second. In Class 3, for twelve varieties, *Captain Knight of Bobbing* was first with *Ulrich Brunner*, *Gabriel Luizet*, *A. K. Williams*, *Madame Cusin*, *Duchess of Bedford*, *La France*, *Jules Finger*, *Etienne Levet*, *Charles Lefebvre*, *Madame Bravy*, and *Mdlle. Annie Wood*. In Class 4, for nine Teas, some beautiful flowers were shown, the Rev. F. R. Burnside being placed first with *Madame de Watteville*, *Madame Cusin*, *Innocente Pirola*, *Souvenir d'Elise Vardon*, *Hon. Edith Gifford*, *Miss Ethel Brownlow*, *Catherine Mermet*, and *Princess Beatrice*. For six blooms of any dark Rose, Dr. Tucker was plainly first with *Ulrich Brunner*. Colonel Pitt second with *Madame Isaac Pereire*. For six of any light *Captain Knight* was first with *La France*, and *Charles O'Shea, Esq.*, second with *Captain Christy*. In Class 7, for twelve Roses grown within three miles of the village of Farnham, Dr. Tucker was first with a good stand, comprising *Beauty of Waltham*, *Abel Carrière*, *Captain Christy*, *Marie Baumann*, *Comtesse d'Oxford*, *Heinrich Schultheis*, *Ulrich Brunner*, *Madame Gabriel Luizet*, *Duke of Edinburgh*, *Madame Hippolyte Jamain*, and *Senateur Vaisse*. In the class for nine varieties Mr. H. Wallis was first with *Charles Lefebvre*, *Madame de Castellane*, *Duke of Connaught*, *Captain Christy*, *Louis Van Houtte*, *La France*, *Alfred Colomb*, *Princess Beatrice*, *Emilie Hausburg*, and *Edouard Morren*. Mrs. Dalton was second. For six Roses the first prize was awarded to A. Hugh Smith, Esq., for *Louis Van Houtte*, *Gloire de Dijon*, *Prince Camille de Rohan*, *La France*, *Marie Finger*, and *Etienne Levet*. For six Teas the first prize was awarded to Mr. H. Wallis for *Anna Olivier*, *Madame de Watteville*, *Innocente Pirola*, *Souvenir d'Elise*, *Souvenir de Therese Levet*, and *Madame Caroline Kuster*. Dr. Tucker was second. The silver-gilt medal in the distinct classes was awarded to Dr. Tucker for a finely coloured bloom of *Duke of Edinburgh*. The silver medal for the best Rose in the amateurs' classes was awarded to C. O'Shea, Esq., for a good bloom of *Her Majesty*, and the bronze medal to H. Waller, Esq. for *La France*.

The various prizes offered for decorative arrangement of flowers were well contested, the first for three centrepieces going to Miss Solomon for three vases of Iceland Poppies; these were very pretty, but it is questionable if it can be called arrangement of flowers, for they are simply put on without any arrangement; however, they were attractive. The first prize for one centrepiece was awarded to Miss Maddocks for a pretty bronzy arrangement with bronze-coloured Iris, &c. The other prizes were shared by Mrs. Hugh Smith, Miss Allenson, Miss Ashurst, Miss Maddocks, The Misses Rasleigh, &c. There were several arrangements of tables with flowers, where the first prize was awarded to Mrs. Seale. There were some fine dishes of Strawberries, as there ought to be from this Strawberry growing district, and it was worthy of notice that the only kind shown was Sir Joseph Paxton.—D., Deal.

REIGATE.—JUNE 30TH.

THE Reigate Rose Society, holding on to their favourite date, the last Saturday in June, have this year obtained one of the best show days in the south of England. Yet even this, June 29th, was thought too late, and June 23rd was said on all sides to have been the climax of Rose blooming, an almost unprecedented earliness of date with show Roses. The entries were seventy-five as against fifty last year, and the quality of the exhibits pronounced high by the Judges, especially amongst the Teas, which were of peculiar brightness and substance. The Judges, Committee, and other friends were, as usual, entertained at luncheon, at his residence, by Mr. Hayward, the President. A military band was in attendance, and the grounds of Mrs. Waterlow, kindly lent again for the occasion, presented a gay spectacle throughout the afternoon. The awards were as follows:—Class 1, open to all England, nurserymen and amateurs, twenty-four varieties.—First, Mr. F. Cant. Second, Mrs. Waterlow. Third, Rev. J. H. Pemberton. Fourth, Messrs. Paul & Son. Twelve Teas.—First, Mr. F. Cant. Second, equal, Mrs. Waterlow and Mr. B. R. Cant. Members only.—Twenty-four varieties.—First, Mr. E. B. Lindsell. Second, Mr. E. M. Bethune. Third, Mr. R. E. West, who also occupied the same relative positions for six triplets. Twelve varieties.—First, Mr. E. Mawley. Second, Rev. A. Cheales. Third, Miss Baker (nine entries). Four triplets.—First, Mr. Burnand. Second, Mr. Mawley. Third, Mr. Cheales. Nine Teas.—First, Mr. Mawley. Second, Miss Baker. Third, Mr. E. Horne. Six varieties.—First, Mr. Orpen. Second, Mrs. Ponsford. Third, Messrs. Hatch and Freshfield, equal; five entries. Six Teas.—First, Mr. Orpen. Second, Mr. Freshfield. The silver floral medal of the Royal Horticultural Society for the best box of Roses was awarded to Mrs. Waterlow. The bronze medal given by Mr. West to the best H.P. was won by the same exhibitor with Lord F. Cavendish. A similar award given by Mr. J. D. Pawle for the best Tea being won by Mr. Bethune with *Comtesse de Nadaillac*. Table decoration for six persons.—First, Mr. Fearon. Second, equal, Miss K. Baker and Mrs. Burnand. Third, Miss Baker. New Roses were shown by Messrs. W. Paul & Son, Waltham Cross, and Paul & Sons, Cheshunt, also Prince's new white sport from *Souvenir d'Ami*.

In Mrs. Waterlow's boxes (Mr. Brown, gardener) there were noticeable *Innocente Pirola*, *Francisca Kruger*, and *Star of Waltham*, of great size and perfection. In Mr. F. Cant's, *Horace Vernet*, *Boule d'Or*, as this most difficult Rose is rarely seen. In Mr. Prince's stand *The Bride* was very large and fine; *Madame Cusin* was of great size and excellence, also *Boule d'Or* was very fine.

ROYAL HORTICULTURAL SOCIETY.

NATIONAL ROSE CONFERENCE AND SHOW.—JULY 2ND AND 3RD.

WHEN the Royal Horticultural Society announced as a part of their programme for the present year that it was intended to hold a representative show of Roses and a conference of Rose growers in the gardens at Chiswick the idea was received with general approval, and a scheme was soon developed that promised excellent results. The full assistance of the National Rose Society was at once accorded, and a large influential Committee was formed, comprising principally the members of the Rose Society's own Committees, with the addition of others from the ranks of the Royal Horticultural Society, and a large number of foreign members interested in the matter.

It was stated in the preliminary announcement that "the object of the Conference is to get together as large and as representative a collection of Roses of all descriptions as possible; to form an exhibition of all subjects pertaining to the Rose, whether in its botanical, its horticultural, its literary, or its artistic aspects; and to bring together for the purposes of reciprocal information and fellowship all those interested in the Rose and its culture." A schedule was accordingly prepared, in which eighteen classes were enumerated, one for a large general collection of Roses, number not limited, to be arranged in their several families. Then six classes were grouped under the title Summer Roses, in which provision was made for the Moss and Provence Roses, the various hybrids of the China and Bourbon types, single Roses, and others. The next group comprised eleven classes for autumn-flowering Roses, in which Hybrid Perpetuals, Teas, and Noisettes were the chief features, two classes being devoted to "species of Roses" and "Rose literature," specimens of peculiarities of structure and disease being also invited. This was to form the Exhibition portion of the programme.

To render the work of the Conference as useful and convenient as possible it was decided to devote the first day, July 2nd, to matters of horticultural importance, papers dealing with the culture of Roses in its various aspects; the second day, July 3rd, being appropriated to botanical papers and discussion, under the presidency of Mr. J. G. Baker. A number of printed forms were also sent out to the members of the Committee and others inviting statistical returns concerning a variety of matters that could not fail to be both interesting and useful to Rose growers. These included selections of the best Hybrid Perpetuals and Teas for gardens and exhibition, either as plants or cut blooms; Roses for various kinds of soil, with questions relative to the best stocks, &c. When the information thus obtained is tabulated it may be expected to form a compendium of Rose know'edge of considerable value.

Although the exhibits were not quite so numerous as might have been expected, yet they answered their purpose, and the large marquee, 200 feet long, contained some handsome and interesting collections of new and old Roses.

"Class 1.—Great collection of all kinds of Roses, number not limited, one truss of each variety, to be grouped in their several families or classes." So said the schedule, and the exhibits in this class formed perhaps the most important feature of the display. Several Rose nurserymen of repute in the south of England staged collections, their names guaranteeing excellence. Messrs. W. Paul & Son, Waltham Cross, exhibited eighteen boxes, nine being Hybrid Perpetuals. They formed an effective display. The following were, perhaps, the most noteworthy: Madame Charles Wood, fresh and bright; Her Majesty, large but coarse; Violette Bouyer, small, but neat and well finished; Alfred Dumesnil, clear and fresh; Inigo Jones, large and well coloured. Pride of Waltham, Queen of Queens, Lord Bacon, Edouard Morren, Countess of Oxford, Pride of Reigate, and other back row flowers were large and, considering the season, good.

To Bourbons, Hybrid Bourbons, and Noisettes one box was devoted. Of the former Cannes la Coquette, Souvenir de Malmaison, Robusta, and Jules Jergensen were noteworthy; and of the Noisettes, W. A. Richardson, Rêve d'Or, and Fellenberg were best. Another box contained climbing Teas, such as Cheshunt Hybrid, Reine Marie Henriette, Belle Lyonnaise, Pink Rover (very attractive), Climbing Devonensis, and Madame Berard.

Teas and Hybrid Teas (two boxes) were best represented by Madame de Watteville, Perle des Jardins, Rubens, Madame Hoste (very beautiful), Grace Darling, Comtesse de Nadaillac, W. F. Bennett, Marie Van Houtte, and Madame Hippolyte Jamain. Amongst Austrians was the richly coloured Persian Yellow. Harrisoni, single yellow, was also good.

Amongst the most attractive Polyanthas were Little Dot, Anne Marie de Montravail, and Princesse des Pays-bas. The brilliant Fabvier was conspicuous among the Chinas, and so was Belle de Florence. In the same box were Rugosa and Rugosa alba (both very beautiful), Glorie des Rosamanes, and Madame Georges Bruant. The most attractive Moss variety was the Crested. Of other Roses, Blairii No. 2, Félicité (Parmentier), the Virginian Rambler, the Garland, Laure Davoust, and the Crimson Boursault were the most conspicuous.

Messrs. G. Paul & Son, the Old Nurseries, Cheshunt, also had a very extensive display, comprising fourteen boxes. The H.P.'s were a very bright even lot, and included some good blooms, notably Beauty of Waltham, Lady Mary Fitzwilliam, Prince Arthur, Victor Verdier, Catherine Soupert, Marie Raly, Her Majesty, Star of Waltham, Abel Carrière, Mrs. Charles Wood, Pride of Waltham, and Lady Helen Stewart. The Teas were fairly good. Amongst the best shown were The Bride, Marie Van Houtte, Belle Lyonnaise, Innocente Pirola, Souvenir d'Elise Vardon, Anna Ollivier, Mme. Bravy, and Francisca Kruger. Vivid, Juno, Paul Verdier, and Mrs. Bosanquet were amongst

the best of the Chinas, and there were some attractive singles, including Paul's White and Paul's Red, both bright and beautiful, Macrantha and Lucida. Hybrid Climbers comprised Evergreen Flora, Bennett's Seedling, Mme. Plantier, and Laure Davoust. Mignonette and Gloire des Polyanthes amongst the Polyanthas; L'Idéal, W. A. Richardson, Aimée Vibert, Reine Olga de Wurtemberg (very rich), Cheshunt Hybrid, Marie Lavallée, and Vicomtesse Folkestone. Amongst the Hybrid Teas were other pretty Roses in this large and handsome collection.

Mr. Rumsey, Joyning's Nurseries, Waltham Cross, had seven stands, chiefly H.P.'s and Teas, amongst which many of the varieties already named were well exhibited. The Teas collectively were very bright and fresh. Mr. C. Turner, Royal Nurseries, also had a fine lot, comprising eight boxes. The H.P.'s were of average excellence, and the Teas an admirable collection. Polyantha, Moss, and other Roses completed this fine display.

SUMMER FLOWERING ROSES.

Many of the old summer flowering Roses which—beautiful though they were, only had one period of beauty in the season, and that often of short duration—have been superseded by the Hybrid Perpetuals of more modern times, giving a succession of blooms into late autumn. Still much can be said in favour of some of these old and now neglected varieties, and lovers of Roses can always appreciate a bed or border of these free flowering and frequently charmingly fragrant past favourites when they chance to meet with them in some old country garden where those and similar plants are treasured. It was, therefore, a good idea on the part of the Committee to devote a section of the schedule to such Roses, for they add much to the beauty of any garden, and all establishments cannot be devoted exclusively to the production of exhibition blooms. For example, how much pleasure is derived from the inspection of an old-fashioned Rose garden, where trellises, pillars, and bowers are covered with climbing and cluster Roses, masses of soft tinted flowers, not much use for cutting except in a very young state, but exquisitely beautiful in their untrained freedom and extreme floriferousness. Even the old Rosa alba and its varieties, so familiar in some country districts, are not to be despised, for its flowers are charming in all stages from an artistic point of view, more so than the substantial H.P.'s and Teas, which we are now more accustomed to see.

Class 2.—Collection of Moss and Provence Roses, number not limited, not more than six trusses of each variety. Three exhibitors entered in this class, each of whom had some pretty varieties. Messrs. W. Paul and Son, Waltham Cross, had a box containing several pretty Moss Roses, the Pink Crested, White Bath, Common Pink Moss, and Little Gem being the most notable, the latter in particular having very neat crimson blooms, fragrant and free. Milton was shown as a new variety of Provence Rose, rich crimson and extremely fragrant.

Messrs. G. Bunyard & Co., Old Nurseries, Maidstone, also had a varied collection, including of Moss Roses Little Gem, already noted; White Bath Moss, in capital condition; Blanche Moreau, white, compact blooms, very neat in the bud; Crested, large, full, and sweet. Reine Blanche was also a good white Moss variety, and Céline a neat dark crimson purple, excellent in the bud. Of the Provence Roses there was the old common Provence, semi-double, pink, free, with clusters of buds; also Spong's, one of the Provence type, and Tuscany, small but deep velvety crimson, especially beautiful when half opened.

Messrs. J. Cranston & Co., Hereford, showed a stand in the same class, Moss Roses representing Baron de Wassenaer, Crested Moss, Perpetual White, Comtesse de Murinais, blush, and several others of attractive character, but not showing the Moss development very strongly.

Class 3, collection of Hybrid Chinas, Bourbons, Gallicas and Albas, number not limited, not more than six trusses of each variety. Messrs. W. Paul & Son contributed two stands of about two dozen varieties, the best of which were Madame Legras, white, sweet, and excellent; Madame Plantier, somewhat similar, and quite as free, but not so fragrant; Paul Perras, crimson, very free and good; Chas. Lawson, bright rose, large, and attractive; Blairii No. 2, delicate rose, with shell-like petals; Juno, soft blush, very handsome in the bud; and Ohl, rich crimson, sweet, and free.

Messrs. G. Bunyard & Co.'s collection in the same class also comprised some charming Roses, the Bourbon Madame Isaac Pereire being as fine in substance as a Hybrid Perpetual. The Hybrid Noisette Madame François Pittet, white, most floriferous and attractive, was noteworthy. The Bourbon Cannes la Coquette, something like a miniature La France Rose, is a charming variety, and was well represented by fresh buds and half opened flowers, and the Hybrid China Paul Ricaut, bright crimson and sweet, was one of the best varieties.

Messrs. Cranston & Co. had a stand of Hybrids, including Breunus, Madame Plantier, Juno, Madame Alfred Carrière, Blairii No. 2, and Fulgens amongst the best.

Class 4, collection of single Roses of decorative value, not more than six trusses of each variety.—Only one collection of these was shown, namely that from the Rev. J. H. Pemberton, which included several semi-double varieties as well. Of the singles were shown R. rubiginosa (Sweet Briar), R. cinnamomea plena, small, pale pink; R. rugosa alba, the white Japanese Rose, and R. lucida, soft crimson with a cluster of golden stamens; but one of the most beautiful of all was the striped Damask, crimson, blush and white in small streaks. Amongst the semi-double varieties were a pretty China Rose, several Damask Roses, the fine white Félicité Perpetué, a deep velvety crimson Tuscany, and the delicately beautiful Maiden's Blush.

Class 5, collection of Climbing Roses, not more than six trusses of

each variety.—Messrs. W. Paul & Son and Messrs. G. Bunyard & Co., and Messrs. Paul & Son were the exhibitors in this class, and each had a charming collection. The Waltham Cross stands contained capital examples of the following:—*Virginian Rambler* (Ayrshire), bluish white, delicate and graceful, semi-double; *Myrianthes Rénoucle* (sempervirens), white tinted crimson, deeper in the bud, clustered and free; *The Garland*, somewhat like a *Polyantha*, small, white or tinted pink, most floriferous; *Vivid* (Hybrid China), rich crimson, small but attractive; *Laure Davoust*, a small compact flower, varying from white to mauve, an extremely pretty variety; *Ruga* (Ayrshire), white, and free; and *Coupe d'Hébé* (Hybrid China), pink, full, and most delicately fragrant.

The Maidstone Climbing Roses were mostly white, yellow, or golden. *Maréchal Niel*, *Gloire de Dijon*, Climbing *Devoniensis*, *Beauté de l'Europe*, excellent; *Aimée Vibert*, *Bouquet d'Or*, *Madame Berard*, *Céline Forestier*, and *W. A. Richardson* being the best, together with *Cheshunt Hybrid* and *Reine Marie Henriette* amongst the coloured varieties.

Messrs. Paul & Son had eleven baskets of Climbing Roses, displaying their characters to much better advantage than in the ordinary boxes. Amongst them were *Flora*, bluish tinted; *Alice Gray*, white and bluish, delicate and pretty; *The Garland*, a small white, most floriferous variety; *Bennett's Seedling*, white, free; *Madame Plantier*, *Félicité Perpetué*, *Coupe d'Hébé*, and *Russelliana*, small, rich crimson.

Class 6, collection of *Polyanthas*, not more than six trusses of each variety.—Messrs. Bunyard & Co. showed the only representatives of these graceful Roses, and the most noteworthy varieties were *Perle d'Or*, deep golden orange; *Fairy Pet*, white; *Anne Marie de Montravel*, white, excellent; *Mignonette*, pale pink, free; *Gloire des Polyanthes*, pale rose, free.

Class 7, any other summer flowering Rose or Roses, not more than six trusses of each variety.—Messrs. Bunyard & Co. had a stand of summer flowering Roses, comprising *Persian Yellow*, *Rosa Mundi*, the single *R. indica*, the *Yellow Austrian Briar* in excellent condition, *Paul's Single White*, very fine; *Rose Button*, a neat pink bud; and *Baron Gonella*, bright rosy crimson, lighter on the inner surface, fragrant.

AUTUMN-FLOWERING ROSES.

The classes devoted to these included representatives of the principal exhibition Roses, good examples of *Teas* and *Hybrid Perpetuals* being staged by the chief trade growers. *Teas* from Mr. Prince were wonderfully fresh and good, and the brightly coloured varieties of H.P. were noteworthy for their rich clear tints.

Class 8, collection of *Hybrid Perpetuals*, not exceeding forty-eight varieties, one truss of each.—Three collections were here staged. In that from Messrs. Burrell & Co., *The Nurseries*, Cambridge, the finest blooms were *Mdme. Montet*, *Marquise de Castellane*, *Her Majesty* (very fine), *Horace Vernet*, and *Comtesse d'Oxford*. Messrs. Cranston & Co., *Hereford*, were admirably represented by *Mdme. Charles Wood* (a beautiful bloom), *John Stuart Mill*, *Mdme. Marie Rady*, *M. Etienne Levé*, *Mons. E. Y. Teas*, *Star of Waltham*, and *Merveille de Lyon*. These were amongst the finest blooms in the Show. *Alfred Colomb*, *Mrs. John Laing*, *Marie Verdier*, and *Mdme. Eugène Verdier* were the best blooms in Messrs. Keynes, Williams & Co.'s stand. There were four stands of twenty-four H.P.'s. Mr. Frank Cant of Colchester had *Alfred Colomb*, *Her Majesty*, *Ulrich Brunner*, and *Charles Lefebvre* very fine and richly coloured. *Ulrich Brunner*, *A. K. Williams*, *Countess of Oxford*, and *Star of Waltham* were Messrs. G. Bunyard & Co.'s best flowers, and Messrs. Cranston had *Mdme. Charles Wood*, *Star of Waltham*; *Marie Rady*, and *Marie Baumann* in splendid condition. Messrs. Cheal and Sons, *Crawley*, also had a neat box.

In twelves (class 10) there was a fine stand from Mr. Frank Cant, with good boxes from Messrs. Keynes, Williams & Co., Cranston & Co., and Mr. E. Mawley, *Rose Bank*, *Berkhamstead*.

Teas and *Noisettes* (twenty-four varieties) were represented by five stands, which contributed a most pleasing display. The Rev. F. Burnside's blooms were, though small, in beautiful condition and admirably arranged. Mr. G. Prince of Oxford showed *Madame Cusin*, *Madame Watteville*, *Comtesse de Nadaillac*, and *Alba Rosea* very finely, and all his flowers were good. Mr. F. Cant's blooms were splendid. *Madame Cusin* was superb, while *Niphetos*, *Madame de Watteville*, and *Innocente Pirola* were little inferior to it. Messrs. Cranston and Burrell also had charming stands. Twelves were shown by the growers already named. Mr. F. Cant had a fine *Catherine Mermet*, and Mr. G. Prince a superb *Niphetos*.

Teas in bunches formed a delightful display, especially where freely assisted with foliage, as in Mr. G. Prince's stand. These comprised exquisite blooms of buttonhole size. Messrs. Paul & Son, *Cheshunt*, and G. Bunyard, *Maidstone*, also had beautiful stands, the whole forming a charming feature, and awakening covetousness in many a breast. Such varieties as *Madame de Watteville*, *Caroline Kuster*, *The Bride*, *Etoile de Lyon*, *Mons. Furtado*, *Marie Van Houtte*, *Madame Bravy*, and *Marquise de Vivens*, were exquisite.

There was only one collection of *Polyanthas*, this coming from Messrs. W. Paul of Waltham Cross, and comprising *Gloire des Polyanthes*, *Princess des Pays-Bas*, *Little Dot*, *Georges Pernet*, *Perle d'Or*, and *Anne Marie de Montravel* amongst others.

There were two collections of *Chinas*, one from Messrs. Bunyard and Co., the other from Messrs. William Paul & Son. In the former *Fellenberg*, *Duchess*, *Crimson China*, and *Common or Blush China* were the best; in the latter *Cramoisie Supérieure*, *Duchess*, *Little Dot*, *Louis Philippe*, *Mrs. Bosanquet*, and the *Common*.

In the class for exhibits relating to wild species of *Roses* there were

several exhibits, but these came more especially under consideration on the second day, which was devoted to botanical subjects. From the Royal Gardens, *Kew*, came a collection of *Roses* arranged in the following groups:—*Systylæ*—comprising *R. moschata*, *R. polyantha*, *R. capreolata*, *R. sempervirens*, *R. nivea*, and *R. stylosa*. *Banksianæ*—*R. sinica* (not in flower). *Cinnamomeæ*—*R. cinnamomea*, *R. carolina*, *R. lucida*, *R. nitida*, *R. rugosa*, *R. anserinifolia*, *R. pisocarpa*, and *R. nutkana* (nearly all in flower). *Pimpinellifoliæ*—representing *R. acaulis*, *R. myriacantha*, *R. spinosissima*, *R. hibernica*, and *R. macrophylla*. *Centifoliæ*—including *R. gallica*, *R. centifolia*, *R. damascena*, and *R. burgundica*. *Villosæ*—the chief one *R. tomentosa*. *Caninæ*—showing *R. noisettiana*, *R. canina*, *R. indica*, *R. anemonæflora*. *Rubiginosæ*—comprising *R. rubiginosa* and *R. sepium*.

Mr. R. Irwin Lynch, Curator Botanic Gardens, Cambridge, showed specimens of the following *Roses*:—*R. alpina*, *R. Beggariana* from *Turkestan*, *R. blanda*, *R. canina* var. (*R. dumalis*) or *R. sarmentacea*, which runs up a tree to the height of 25 feet; *R. gallica*, *R. indica* (the "Green Rose"), *R. pumila Redouté*, so called by Professor Crépin, but it was previously called *R. minima*; *R. involuta*, variety *Wilsoni*, *R. lucida*, *R. macrantha*, *R. macrophylla*, *R. Manetti*, *R. polyantha*, *R. repens*, *R. rubiginosa*, *R. rubrifolia*, and *R. rugosa*. *R. gallica*, *R. macrantha*, and the reddish tinted foliage and shoots of *R. rubrifolia* were the most notable, as the others had suffered greatly in transit.

The Rev. J. H. Pemberton, *Havering-atte-Bower*, *Essex*, showed *R. arvensis*, *R. canina*, *R. rubiginosa* (*Sweet Briar*), and an unnamed variety, all gathered wild in *Essex*.

T. W. Girdlestone, Esq., *Sunningdale*, *Berks*, exhibited two charming stands of species and varieties, comprising *R. rugosa*, *R. lucida*, *R. multiflora* varieties, *R. Beggariana*, a small white and graceful *Rose*; *R. rubrifolia*, *R. indica* variety, the pretty yellow, crimson-centred *R. Hardyi*, the small *R. pisocarpa*, with purplish flowers; *R. indica* variety, red and white; *R. macrantha*, large black tinted *R. multiflora*. Other *Roses* shown by Mr. Girdlestone were the *Red Damask*, *Hybrid Sweet Briar*, *Hebe's Lip*, *Rosamène Bardon Job*, single glowing crimson, very handsome; *Noisette l'Idéal*, a peculiar rosy bronze tint, distinct; and *Rosa lucida Rose Button*, a very neat pale crimson bud.

Messrs. Paul & Son, *Cheshunt*, exhibited thirty-six plants of various species, but nearly all were out of flower.

The following awards were announced, but later on the opening day:—

Class 1.—Messrs. Paul & Son and W. Paul & Son silver *Flora* medal, and Mr. W. Rumsey, silver *Banksian* medal.

Class 2.—Messrs. G. Bunyard & Co., silver *Banksian* medal.

Class 8.—Messrs. Cranston & Co., silver *Flora* medal, and Messrs. Keynes, Williams & Co., a silver *Banksian* medal.

Class 9.—Mr. F. Cant, a silver *Banksian* medal.

Class 11.—Mr. G. Prince, a silver *Flora* medal, and Mr. F. Cant, a silver *Banksian* medal.

Class 12.—Messrs. Keynes, Williams & Co. and Mr. G. Prince, silver *Banksian* medals.

Class 17.—Mr. T. W. Girdlestone, a silver *Banksian* medal.

THE CONFERENCE.

A large marquee was appropriated to the purposes of the Conference, and when the President, *Dean Hole*, opened the proceedings with a brief historical address there was a good number of visitors present. Several papers were read during the afternoon. The Secretary has favoured us with abstracts of the following:—

PROFESSOR CRÉPIN'S NEW CLASSIFICATION OF ROSES.

After a short historical introduction, M. Crépin proposes his new scheme, according to which the genus *Rosa* is divided into fifteen sections, the sections being founded on the characters afforded by the styles, the sepals, the inflorescence, the number of leaves on the flowering branches, the stipules, the bracts, the prickles, and the general habit. The sections proposed are—1, *Systylæ*; 2, *Stylosæ*; 3, *Indicæ*; 4, *Banksiæ*; 5, *Galliæ*; 6, *Caninæ*; 7, *Carolinæ*; 8, *Cinnamomeæ*; 9, *Pimpinellifoliæ*; 10, *Luteæ*; 11, *Sericæ*; 12, *Minutifoliæ*; 13, *Bracteate*; 14, *Lævigatæ*; 15, *Microphyllæ*. Each of these sections is described, and the species allotted to it mentioned. In all about sixty species are enumerated.

LORD PENZANCE'S PAPER.

In this paper the writer traced the development of *Rose* culture from the time when the Dutch some seventy to eighty years ago commenced to propagate *Roses* by seed. The example was quickly followed by the French. Adverting to times present, his lordship laments the enfeebled constitution and the absence of perfume which characterise many modern *Roses*.

He regrets also the disappearance of the *Bourbon* *Roses*, the "alba" *Roses*, and the *Perpetual Damasks*.

The introduction of new races is counselled, and the means of obtaining them by hybridising and cross-breeding pointed out. Lord Penzance practises what he preaches, and exhibited various specimens as follows:—

Sweet Briar fertilised by the pollen of H.P. *La Souveraine*. Sown November, 1885, seedling came up in January, 1886.

Sweet Briar fertilised with H.C. *William Jesse*, came up January 1886.

Sweet Briar fertilised with pollen from H.B. *Paul Ricaut*.

Sweet Briar fertilised with pollen from H.C. *William Jesse*.

Luxembourg Moss fertilised with H.P. *Princess Christian*. Seed sown 1884, came up in February, 1885.

ON ROSA POLYANTHA AS A STOCK FOR BUDDING.

BY M. VIVIAND MOREL, LYONS.

The author points out that M. Alegatière, of Lyons, ascertained that the seeds of this species germinate within a month without being stratified, so that the stock can be budded in the first year. Various confirmatory statements by different experimenters are given; amongst others, some by M. Bernaix, who advocates the budding of Roses on seedling Polyantha stocks as specially suitable for pot Roses, and Roses intended for forcing. Such plants come into growth and flower ten to fifteen days earlier than those budded on the Briar, and do not throw up suckers. The stock is as well suited for Teas as for H.P.'s. M. Vivian Morel himself repeated these experiments with the same results.

A comparative trial of Roses for forcing, budded on the seedling Polyantha and on the seedling Briar respectively, and in which the conditions were identical, gave the following results:—Roses budded on the Polyantha stock gave twice the number of flowers that the same variety produced on the Briar, and, further, they were a fortnight earlier.

THE DINNER.—In the evening between sixty and seventy gentlemen, Fellows of the Society and members of the National Rose Society, dined together at the Hotel Métropole, under the chairmanship of Sir Trevor Lawrence, Bart., M.P., President of the Royal Horticultural Society, who was supported on the right by the Very Reverend the Dean of Rochester, M. de la Devansaye, and Dr. Hogg, and on the left by Mr. J. G. Baker and Dr. Masters. The Dean of Rochester proposed "Prosperity to the National Rose Society," coupled with the name of Rev. H. H. D'Ombraïn, the Secretary. Then followed the health of the "President of the Royal Horticultural Society," "The Visitors," responded to by M. de la Devansaye; "The Press," which was responded to by Dr. Master, Dr. Hogg, and Mr. Shirley Hibberd.

FRUIT FORCING.

VINES.—*Early Houses.*—The Grapes having been cut, keep the house as cool as possible by free ventilation, and withdraw the roof lights where practicable when rains prevail. The cleansing effect of rain is very beneficial, and a thorough moistening of the borders will do much towards the production of fresh laterals and the maintenance in health of the principal leaves, thereby preventing premature ripening of the foliage. Vines that are becoming exhausted through long subjection to early forcing and bearing heavy crops should have one of the borders renovated, and the roots laid in fresh material near the surface, for which prepare by getting the material together, as it is important work of this kind be executed at the right time and with despatch. One of the borders only need be operated upon at a time, taking say the inside border one year, and following with the outside border the next. The proper time to attend to the roots in the case of early Vines is as soon as the foliage gives indications of ripening. Syringe the foliage every evening in fine weather to preserve the leaves in a healthy condition as long as possible, for when they die prematurely second growth will commence about the time the Vines ought to be pruned and going to rest.

Houses of Ripe Grapes.—Keep the houses cool, and on hot days sprinkle water on the borders and floors, which will be beneficial. Moderate moisture will not injure ripe Grapes at this season provided it is not stagnant and the temperature is not allowed to advance in the morning before ventilation is increased. A temperature of 55° to 60° will be sufficient for ripe Black Hamburgs at night, but Muscats will need fire heat to prevent the temperature falling below 60° to 65° at night. Turning on the heat in the morning to allow a free circulation will materially assist in the maturing of Muscats even after they appear ripe. Moisture must be carefully guarded against in the case of Muscats, or they soon spot in a moist confined atmosphere. Allow a gentle circulation of air constantly, even if fire heat has to be employed to secure it. A slight shade is absolutely essential to Black Hamburgs keeping colour for any length of time after ripening. Some doubled garden netting drawn over the lights is mostly sufficient. Muscats colour in proportion to the light and heat they receive.

Grapes Ripening.—Ventilate constantly, a circulation of warm rather dry air being essential to good finish. Black Hamburgs and similar varieties need only have a night temperature of 60° to 65°, and 70° to 75° by day; but Muscats require 70° to 75° at night, and 80° to 85° by day, advancing with sun heat to 90° or 95°. If there is likely to be any deficiency of moisture in the borders, give a thorough soaking, choosing the early part of a fine day, and ventilate freely. Mulching with short dry material will prevent any danger of moisture arising to the injury of the crop. Admit plenty of air after the Grapes change colour.

Grapes Stoning.—Dull weather, with occasional gleams of sun is the worst for scorching and scalding Grapes. It is best to have a little

fire heat to prevent a low night temperature, and admit of early ventilation to prevent the deposition of moisture upon the berries. If they are allowed to be covered with moisture, and the sun raises the temperature considerably before ventilation is given, the leaves and berries will assuredly suffer. A little heat and free early ventilation are the preventives of scorching and scalding. When the stoning is over, and the fruit commences ripening, danger from scalding is considered past, but Muscat of Alexandria is often scorched badly even after the Grapes are advanced in colour, and a slight shade as that of garden nets drawn over the roof lights is of great benefit.

Late Houses of Black Hamburgs.—The thinning must be concluded without delay. Thin well, but not unduly, and remove surplus bunches if there be any doubt about the crop, for Black Hamburgs to hang well must be as thick in the skin, as firm in flesh, and as highly finished as possible. It is nonsense expecting crops that do not finish higher in colour than a reddish black to hang well, for they will only disappoint. Either they must be black and have as much bloom as Sloes, or they will not keep colour long. Allow a fair amount of lateral growth, as Grapes of this class finish better with a modified light, but avoid overcrowding.

TRADE CATALOGUES RECEIVED.

E. H. Krelage & Son, Haarlam, Holland.—*Wholesale Catalogue of Bulbs and Tubers.*

Damman & Co., San Giovanni a Teduccio, Naples, Italy.—*Wholesale Catalogue of Bulbs and Tubers.*

•• All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Insects (T. M.).—We cannot undertake to name insects "caught in fields" without any reference to the crops they attack.

Twin Cucumbers (W. Day).—Such examples are neither very common nor very rare. We have one or more sent to us every year, and now and then three or four at once. Still they are not produced by one plant out of a hundred, and cannot be perpetuated by seed or cuttings, the jointure being accidental, not constitutional.

Pelargonium Sport (G. J. & Co.).—We regret that in the absence of a little gum for sealing the petals, and the want of packing to keep them fresh, that the whole were either shaken off or so much curled and withered as to render any satisfactory comparison impossible. One flower is evidently much richer in colour than the loose petals of the others, and resembles the variety named Dr. Masters.

Seedling Carnation (H. A. M.).—The flowers arrived in such a withered state, through want of suitable packing, that it is impossible to determine the merits of the variety. It is as disappointing to us as it must be to the senders of flowers for our opinion, or naming, to find that they arrive in what must be a totally different condition from that in which they were when gathered. It is essential that they reach us in a fresh state, as is almost invariably the case when packed according to our standing instructions below.

Gall on Poplars (T. L., Canterbury).—The twigs of Poplar sent are to some extent infested with aphides, but the curious galls or protuberances are the work of a species of Psylla, specimens of which in an adult stage are crawling about the leaves. Many of the Psyllidæ are mistaken for aphides, and they are nearly related; but a Psylla leaps in its perfect condition as well as flies, which an aphid never does. Some of the Psyllidæ protect themselves from the weather by twisting and contorting buds or leaves, but this Poplar-haunting species forms a more secure abode by piercing the twigs so as to produce a swelling, within which a crowd of these insects in various stages may be found closely packed. Towards the autumn the galls will be deserted. It is not known at present how these insects pass the winter. The same applications are of utility which are successful in the destruction of kindred aphides.

Pansies Failing (M. J. E.).—We do not think the injury to the stems some distance below the surface is caused by slugs; nor are we

certain that it is the work of grubs, though it may be. You give no indication of the time you planted the Pansies. When planted in the spring, and a term of cold weather follows, preventing their quick establishment, dry hot weather succeeding, the plants are almost certain to fail. They can only resist the effects of hot weather when the roots are working freely and deeply in good moist soil, and when not so working the stems shrink and the plants wither. More Pansies fail through late spring planting, especially shallow planting in poor soil, than through any other mistake that is made. If your garden is infested with grubs, however, it may be naturally expected they would attack the plants. The nature of the soil and time of planting are such important factors in the case that, in the absence of information thereon, we are unable to give a more definite reply.

Peas Withering (N. H. P.).—If a number of Notts gardeners "put their heads together" over a "new disease" without obtaining light concerning it, the origin of the evil must be very obscure and the remedy proportionately difficult to determine. We have had Peas similarly affected to those you send from time to time during the past forty years. The stems shrink just within the soil, and the leaves wither upwards. As it has only occurred with us occasionally, in other years the growth being satisfactory, we have attributed the collapse to weather influences. It would perhaps be worth while sending samples to the Scientific Committee of the Royal Horticultural Society, which next meets on the 23rd inst. at 117, Victoria Street, Westminster. What is known as the gangrene in Winter Spinach is common in some soils, seldom occurring in others. Have you tried sowing in deep drills of wood ashes along the tops of ridges, the same as those made by farmers for Turnips, but narrower? We have with advantage; hence concluded the mischief was not at the end of the roots but near the surface of the soil.

Peach Trees Unfruitful (T.).—The unfruitfulness is probably a consequence of over-luxuriance, the soil being too rich and too loose. We should thin out the wood now, in fact cut away all not required for furnishing the trees with extension and fruiting wood for the ensuing season, leaving no more than can have full exposure to light and air, it being important that the growth be thoroughly solidified as made, the sap duly elaborated, and the assimilated matter stored in the wood and buds. In the autumn, when the leaves give indications of falling, the trees may be lifted and have the roots laid in fresh soil nearer the surface, or the old soil may be used, adding to it some mortar rubbish, about a sixth not being too much if the soil is deficient in calcareous matter, and if it is light add a fourth of clay marl in as divisible parts as practicable. Work the soil well amongst the roots and make it firm. Avoid manure in the border, though a little may be used in a lumpy state as a mulch with a view to uniform moisture and encouraging and preserving surface roots. With proper treatment in other respects, which may be gleaned from our Work for the Week column, the trees ought to bear fruit. The crops of Peaches and Nectarines are not very satisfactory this season, the result, probably, of the sunless and moist weather of last year.

Rose Manure (Kittie).—We have no experience of the manure you mention, and from its constituents have very little faith in it as an aid to anything beyond succulent growth. Nitrogenous manures do not tend to form solidified growths, which give the finest and most abundant blooms. Not knowing the condition of your Roses, we cannot say the mixture would not do good, but we can say it would only be of benefit with phosphatic ingredients in the soil. If you use it a thorough watering should be given at least once a week after the buds show, unless the weather be wet, when less frequent applications will be necessary, continuing them until the Roses have done blooming, and when they are in growth again for a late bloom recourse may be had to the manure as assisting the developing buds. Nitrates promote growth, but, if used alone, at the expense of flowers and fruit. We find it better to use muriate of potash and superphosphate of lime, 1 lb. of the former and 3 lbs. of the latter per rod, as a surface dressing in spring, and again early in June, merely scratching or pointing in lightly with a fork. The results on blooms to which the liquid you mention is applied must be infinitesimal on those that will develop ten days hence, as the bloom is dependent on the matter available during the whole of its formation. The formula represents an imperfect manure.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (W. W.).—1, *Cheilanthes elegans*; 2, *Doodia aspera*; 3, *Osmunda gracilis*; 4, *Phlebodium aureum*. (C. A. L.).—1, *Spirea Filipendula flore-pleno*; 2, *Tradescantia virginica*; 3, *Lychnis chalcidonica*; 4, *Winter Savory*; 5, *Pot Marjoram*; 6, *Tarragon*. (J. H., *Leamington*).—1, *Stachys lanata*; 2, *Agrostemma coronaria* (the Rose Campton); 3, *Linaria bipartita*; 4, *Physalis Alkekengi*; 5, *Dictamnus Fraxinella alba*. (W. C.).—We have no flowers from you. We shall be glad to assist in naming any which arrive in good condition. Some are lost in the post through being sent in fragile boxes. Please include the full title of this Journal in the address of packages.

Uniting Bees (Novice).—Your letter cannot be satisfactorily answered this week, and you will gain by waiting for a future issue.

COVENT GARDEN MARKET.—JULY 3RD.

A steady business doing, with good supplies.

MIDSUMMER BUTTER.

AFTER "haysel," when cows are on the aftermath, is the time when the milk is at its best. The glossy coats and sleek condition of the cows then afford the best evidence of good health. It does more, it shows the true value of pure food, pure water, pure air; and it is then that the best butter is made, for it is alike excellent in colour and flavour. Unfortunately for the producer, it is then that the price falls so low that he is unable to get more than half the price which really good butter commands in winter. Advice is now literally showered upon the British farmer, and among other things he has quite recently been told that he should do as foreigners do, and stop making butter to a very great extent when there is such a glut of it in the market. Now, every practical man knows that

such advice is simple nonsense, and if such would-be leaders of the farmer would show him how to preserve his butter so as to hold it in reserve till winter that would indeed be helping him.

It has long been customary at our home farm to save all superfluous aftermath butter in crocks for winter use, and we regret to say the butter so saved is not invariably good when used. It is good enough sometimes, at others it is rank, and that is all the more vexatious because it is evident that by careful management all of it might be good. The crocks should be deep, with the entire surface glazed inside and outside, and not with the bottom part outside left unglazed, as is so frequently the case. Each crock should be filled at once and not gradually, and the top of the crock should be covered so as to exclude air till it is opened in winter for use. Many dairywomen consider it sufficient if they pour enough brine upon the top of the butter to cover it to the depth of half an inch, and then cover with paper or an earthenware lid; but it is not, for it is self-evident if the butter is really well made and kept from the air till required for use it may fairly be expected to prove good then.

Formerly the chief agent used as a preservative in crocked butter was salt at the rate of 1 oz. per lb., with a pinch of saltpetre, but now both salt and saltpetre have been discarded for glaciline, a harmless, tasteless, odourless antiseptic. This is both a preservative and a neutralising agent, the latter property being especially useful in winter to dispel taints imparted by food to milk, and the former is turned to account in summer first of all in the milk, which it prevents turning sour prematurely, and so enables all the cream to rise, and afterwards in the butter to preserve it for winter use. Glaciline is made by the Antitropic Company, Glasgow, but it is becoming so well known that it can be obtained of most dealers in dairy goods. We have recently heard it highly spoken of by Cheshire farmers.

That a steady and improving trade for home dairy produce is now being built up there can be no doubt, and it is the end and aim of all the lectures, conferences, dairy exhibitions, and butter-making contests to assist such efforts. To attract and sustain such a trade there must be a high uniform degree of excellence in conjunction with a regular and full supply. Flavour, colour, texture, must always be up to a certain standard, never below it, and there can be no doubt that well preserved midsummer butter might serve to keep up the standard of quality in winter by mixing a certain quantity of it with the fresh butter with the butter worker. To do this successfully there must be no hit-or-miss guess work; precision depends on weight and measure applied under the guidance of experience tempered by sound judgment. A few careful experiments should suffice to show the quantity and manipulation that is necessary to success. Nothing can be more erroneous than the popular idea that it is impossible to ensure uniform quality in butter, for it is an accomplished fact, of which the best proof is afforded by the heavy importation of such butter.

It is in winter particularly that foreign butter is so much in request. To successfully compete with the farmers of Normandy and Denmark, not only must we do what is possible with midsummer butter, but we must contrive to have plenty of fresh—i.e., newly calved cows, coming in to assist the dairy supply in autumn and winter. This is not difficult, nor is it difficult to have milk that is pure and sweet without taint of any kind then, provided our dietary is correct and the cows are looked after closely. If there are Walnut trees on the pasture, milk troubles in autumn generally begin with the fall of the leaves if the cows can get at them, the acrid flavour thus imparted to the milk quite spoiling it for butter. As the use of silage spreads we feel hopeful that it will do much for the improvement of our winter butter, and serve to counterbalance the effect of dry food, and eventually enable us to discard all roots except perhaps Carrots from the dietary of dairy cows in winter. In summer it should suffice to look to our pastures and see that they contain nothing but the most nutritious sorts of grass and Clover. No doubt there is much need for

improvement in this direction, for in no branch of agriculture has there been greater negligence than in the cultivation of pasture.

WORK ON THE HOME FARM.

Progress with haymaking has been entirely satisfactory, mowing, making, and carting having been done daily with an amount of mechanical precision that is owing altogether to fine weather. Some care has been necessary not to overdry the hay before carting, for with such hot dry weather there is some risk of not having enough heat in the stacks to develop aroma and render the hay as palatable as possible. Mangolds and early Swedes are all hoed, singled, well established in the soil, and are growing freely. The later crops of Turnips are not yet in so satisfactory a condition, and the sowing of more altogether depends upon the weather. Cabbage and Thousand-headed Kale are all doing well, the showery weather in the earlier stages of growth having rendered them fine sturdy plants that are now sufficiently vigorous to bear much hot dry weather with impunity. On the whole the outlook for another winter is very satisfactory. The hay crop is full, abundant, and of excellent quality. Roots will be plentiful; silage cannot fail of being so, for there is an almost bewildering choice of crops for making it, all equally vigorous and abundant. On all well cultivated soil the corn crops are satisfactory. The Wheat is now nicely in bloom. Spring corn is in full ear, but as usual there is an extraordinary degree of difference in the appearance of Barley. On the day of writing this note we have seen Barley coming into ear that was hardly a foot in height, and other Barley nearly a yard in height, and we knew that in each instance the appearance of the corn was altogether owing to the condition of the land, and not to any peculiarity of the season. Depend upon it good farming always tells, and in an average season it answers. No regard must be had to such a season as that of last year, but even then good farming told.

Folding of lambs and sheep upon Sainfoin is ended for the present, and many of the lambs have been sold at very profitable prices. Wool is perhaps a little higher in price than it was last year, but the difference is one of fractions rather than units. Lambs are not sent upon the markets at all freely. Every farmer who can is evidently holding back as many as possible to fatten for hoggets or to add to the breeding flock. In buying lambs for store hoggets to keep over till next spring it is well to avoid those which have been forced on by high feeding, and rather to choose those in a healthy growing condition.

HONOURS FOR SEED CORN AT WINDSOR.—We are desired to state that in the great competition for seed corn at the Jubilee Show of the Royal Agricultural Society both the first and second prizes were awarded to customers of Messrs. James Carter & Co. We are informed that His Royal Highness the Prince of Wales during his visit to the Show personally requested Messrs. Carter to reserve for His Royal Highness a collection of their cross-bred Wheats, which it is the intention of the firm to distribute to the public this autumn. A collection has also been ordered by the Queen.

MR. MARTIN J. SUTTON'S KERRY CATTLE AT WINDSOR.—Having admired the beautiful animals at Dyson's Wood, we have obtained the following particulars of Mr. Sutton's entries of Kerries and Dexters at Windsor last week:—In Class 148 (cows in milk or in calf, calved previous to or in 1886, forty-seven entries), he obtained third prize with Flora, and he with Vernal. In Class 150 (bulls, twelve entries) third with Paradox. In class 151 (cows or heifers in milk or in calf, calved previous to, or in 1886, fifty entries), first prize with Rosemary, and third with Peach. In this class two other animals, Beauty and Silene, were highly commended. In the competition for the Queen's gold medal, Rosemary was left in with Mr. J. Robertson's Limelight. The prize was ultimately awarded to the latter, as being the younger animal, though not until an extra judge had been called in to assist in deciding the award.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

23 d.—Cloudy till about 11 A.M., then fine and bright.
24th.—Cloudy morning, with slight shower about 9 A.M.; some sunshine in afternoon.
25th.—Fine, bright, and warm.
26th.—Bright and hot.
27th.—Hot and generally bright, but cloudy at times.
28th.—Warm and rather close.
29th.—Fine and rather hazy, with occasional cloud.
A week of rainless summer weather. Temperature about 5° above the average. The 29th was the fourteenth consecutive day with out rain.—G. J. SYMONS.

ROSE TIME.

ROSE time is a pleasant time to many, but a busy, even a bustling time, to some, and Rose shows are great events in the floral world, in which thousands of persons are interested. They are looked forward to and prepared for months in advance; and, apart from the beauty of the displays, the occasions afford pleasant opportunities for the meeting of friends who strive to excel each other in the production of the Queen of Summer. Moreover, Rose shows as a rule are the most popular of floral exhibitions; but there are exceptions, and in some provincial towns visitors do not crowd into the halls and tents in anything like the numbers that the managers desire, and which, considering the labour gratuitously given, they are justified in expecting. Time appears to be required for arousing public interest even in the Rose, but when once the spirit of enthusiasm is awakened it spreads rapidly and does not quickly subside.

If the appetite grows with what it feeds upon in anything it is on Roses. Persons there are, and not a few, who have tasted of the pleasures which Roses afford in childhood, and have continued feasting on their charms to manhood and old age. They work amongst them and for them unceasingly, with a zeal that seems untiring. This devotion to a flower so pure, brilliant, and sweet, and one that so well requites all the care bestowed on its production when that which is uncontrollable—the weather—is favourable to its development, is admirable. But even the impediments which have to be contended against in this respect are not altogether to be deplored. The earnest man rather rejoices in a difficulty for the pleasure of surmounting it, and there are various obstacles in connection with the growing and showing of Roses; but no matter of what nature, nor how great they may be, the blooms come when the time comes for them. They may be dashed by the rains one year, and scorched by the sun another. The show fixtures may be too early or too late, but in some way and from somewhere the Roses come and the prizes go. There is never a total collapse in the aggregate, but many personal failures, the precursors perhaps of future triumphs. Hope seems always existent in a rosarian's breast. He may be in "bad form" this year, but looks cheerfully to the next for the smiles of fortune on his efforts, and he wins them sooner or later if he proceeds on sound lines perseveringly.

Rose time is a pleasant time when the sun shines not too brightly, but an anxious and an arduous time to those who engage in the contests. It means work with little intermission; days of activity with nights of travel; a rushing to and fro, always moving, never resting, and it may be when an opportunity for repose comes all the beds are taken. An instance may be cited. One of the great exhibitors of the year and a notable prizewinner arrived in London, proceeding to an hotel in Fleet Street, which has been mentioned before in the *Journal*—Anderton's. Though well known there he was told with many regrets he could not be accommodated. He drove to the great building at Charing Cross, but it was full. Eastwards he rushed to Cannon Street, but the same fate awaited him. On he went to the Manchester, only to be disappointed. He would try Liverpool Street, still he met again with the familiar response, "No room, sir." "But you must find room, I must have a room if I give a sovereign for it." "You cannot have one if you give five." Thus he sought for shelter in

the great city, spending 5s. or 6s. in cab fares driving to and fro, and it was not till a railway inspector took pity on him that he could see an end to his trouble by being taken into the inspector's office to enjoy the luxury of sleeping in a chair.

Rose time, too, is literally a pressing time to another class of individuals who have something to do with the shows—men of the fourth estate—the press. Early and private views are commonly accorded for aiding them in their duties, and but for them the public could not have what they need—good and accurate reports. It may be thought easy to take the names and jot down the characters of the flowers, and it is not difficult when reasonable facilities are accorded, but to do this in a surging, jostling crowd—a seething mass of sightseers craning their necks and forcing their way to a front place, and then struggling to keep it—is a most difficult and invidious task. Such was the state of things we are credibly informed at the Crystal Palace on Saturday last. A fine show, perhaps as good as any that the National Rose Society have held at Sydeuham, was robbed of the interest it should have had for rosarians by the extraordinary arrangements which governed it. As a rule shows are open for private inspection from 11 A.M., when the judges commence their duties, until 1 P.M., when the public are admitted. This is in every respect an admirable arrangement, for time is afforded to the judges to devote such consideration to the stands as it is highly desirable should be devoted to them in order to insure accurate and just awards; moreover, it also affords facilities for such reports of the exhibitions being prepared as shall meet the requirements of the many thousands of persons who, though unable to be present, yet take a deep interest in the proceedings, and whose special interest is far more to be studied than that of a heedless holiday throng.

These considerations were entirely disregarded on the occasion now referred to. Flushed and excited by the visit of Royalty, the Palace authorities thrust the splendid Exhibition of the National Rose Society into a corner, and practically left it to take its chance, tardily affording facilities for what was described as an "early view" at 12 A.M., although as the public were admitted at the usual hour, and within a few minutes of the time that the judging of the principal classes was completed, this privilege was practically worthless. Thus hurried through their duties it is not to be expected that the most competent of judges could extend that calm and careful deliberation to the exhibits which is so eminently desirable, and the representatives of the press were still further embarrassed in their endeavours to discharge a public duty in an adequate manner. A determined effort was made by the busy penmen to register the names of the winners and the winning blooms. To do what they wished was almost impossible, and some gave up the task in despair. The *Journal* representative, being of an unyielding disposition, forced his way along the stands and took the names as best he could. He hopes his report is accurate, but has no one to thank for consideration extended.

So far as we can learn it was a day of Shah on the brain at the Palace last Saturday, and Rose lovers who count upon the National Show as a day of enjoyment, when the best productions of the greatest growers can be studied, the flower in all its numerous varieties discussed, and pleasant converse held upon the varieties, must have been somewhat disappointed. Perhaps the National Rose Society were in no way to blame, but it is evident that when sensational attractions supervene their interests will not be studied, even when they are the innocent cause of that sensationalism being developed; for without the Rose Show we do not suppose there would have been Royalty at the Crystal Palace on July the 6th. That it was a magnificent exhibition, well calculated to awaken widespread interest and admiration, does not unfortunately improve matters, but rather makes them the more to be regretted.

The Rose time has been brighter and shorter than usual; the

dry hot weather of June and early July brought the flowers out rapidly to fade quickly; but many exhibitors have rejoiced in beautiful stands of blooms.

PRUNING OR NOT PRUNING FRUIT TREES THE FIRST YEAR.

MR. WRIGHT very cleverly criticised my remarks at the late Chiswick Conference (March 21st, page 229, *Journal of Horticulture*), which were to the effect, "That as a general rule I do not advise trees to be pruned the first season of planting;" and he had what appeared at first sight to be a mass of evidence on the other side. At the time those remarks were printed we were very busy, and I venture to return to the subject in a more leisure season in nursery work. It is necessary first to clear the ground. Bear in mind that I was advocating Apple-growing for profit—that is, on an extended scale, and my remarks were never intended for garden practice, though I submit they contain equally good advice there. When fruit trees are planted on a farm, say, it generally falls to the lot of perhaps an inexperienced hand to do the work. The holes are not properly prepared, the ground is not closed and tightened as it should be, and to cheapen the cost the work is often put out by the job; therefore the tree first has half its roots cut off so that it shall require a smaller hole, and to give an appearance of work done the tops are cut off too. The tree is often not staked for some time, winter rains come, the ground becomes soft, the tree blows first one way, then another, and round the collar of each tree a pipe-like opening is made; the few roots left are on the move, so that any new fibres are constantly abraded, and although Nature makes a vigorous effort (generally successful with Plums and Damsons because of their copious roots) Pears, Apples, and Cherries die by thousands on the approach of a dry July. Even if the tree is staked and top-pruned what happens? A few pippy, sappy shoots are made which are not hard and woody enough to cut back for good sound eyes, such as ought to produce shoots to form the foundation of an orchard tree; the consequence is that the head is crowded with sprays of fine wood of no value as a base for a vigorous standard, and in despair, if left to Nature, fruit buds are formed, and then farewell to growth so far as the extension of the trees is concerned, and trees like mops are to be seen by hundreds. This is a picture from actual fact, and often in defiance of warnings from ourselves.

On the other hand, under the plan I advocate for orchard or plantation trees, at planting the roots are only partially shortened, the head if crowded has superfluous shoots removed, and the rest are left on the full length. At the earliest leafing foliage starts from the whole of the buds, at once stimulating root action. This increases rapidly, so that the tree starts on its career without loss of time. My opponent says "Yes, and form a lot of useless fruit spurs, and you lose all the wood buds at the base." I admit they are lost to sight, but only sleeping—wait until next spring—the tree is pruned, and it seems hard to cut away all that promise of fruit; but see all these sleeping buds begin to work, and from them there issues a strong wood growth, which clothes the head with healthy stout growths, and at once the form of a basin-shaped head makes itself apparent. I like to thin the centre of any useless wood in August; these shoots are shortened to 3 or 4 inches the following spring, and this operation doubles the shoots and induces stout wood.

I am aware that our Kent system differs from the practice of some counties (see Mr. Molyneux's notes, 251), but I believe this severe pruning in the earlier stages of the tree productive of the utmost after value. It is well known that if a tree begins to bear the growth is retarded by the demand made on it by the fruit. I never intended to say to gardeners, Do not prune the first year in garden culture, nor do I allude to bush trees at all. Experienced men know full well the capabilities of their own soils, and I have seen trees of all sorts pruned the first year doing well, but I am bound to say I have seen trees pruned the second year doing better. Stone fruit trees may be pruned with less danger than pip or kernel fruit trees, but Cherries for orchards are far better left one year. I have very carefully noted the difference where trees have by chance been pruned in the nursery the first year, and on pyramidal and trained trees of Apples, Pears, and Plums the trees are far better when allowed a year's run after removal. They never fail to break from the two-year-old wood, and as far as the formation of a tree is concerned the fruit buds are formed say at the upper three-quarters of the shoot. The portion at the base will always contain enough wood buds to refurbish the tree in whatever form is required. This is what many of your correspondents overlook.

Peaches and Nectarines should be pruned the first year. I may mention that in 1856 I planted some hundreds of trees myself in

an old orchard, which our then old nursery foreman said was tree sick, and failure could only follow my labours; but the whole of the trees treated as I advise made fine examples, and on the expiration of our tenancy the fruit fetched as many pounds as it did shillings before I began. If any of your readers favour me with a call I shall be happy to demonstrate my theory by pointing out successful practice.

In the earlier part of the article, "In nurseries sickly trees were taken up and put in thickly and planted in what was called the hospital, &c." Here, I am afraid, I did not make myself clear. When a quarter containing, say, fifty kinds of fruit gets thin, some being cleared, others partially so, our practice is to take up and place them together. During this operation any sickly or injured trees are cast out. I am afraid the word hospital led Mr. Wright to infer sickness, but as a fact the trees replanted are as healthy as the rest, only they may be of forms not then wanted or under saleable size, as all growers know that it is rare for a row of 100 trees to be fit for sale the same year. They are left unpruned until the following year, and after two summers' growth are fit for sale.

The interesting notes by Messrs. G. Abbey, A. Young, and Walter Kruse (page 272) throw various lights on the subject. I have disposed of some of their objections, and quite agree with Mr. Young. Mr. Kruse plants principally on the Paradise stocks full of roots. Market trees are generally on the Crab stock, but both benefit by being left uncut for a year. Mr. Kruse is a very intelligent grower who sees the work done, and were all cultivators like him I could relax my dictum. Good nursery cultivation means good trees, and good roots also. Our practice differs entirely from Mr. Abbey's ideas (page 271) as to left-over trees. It is precisely late-planted trees that we find most benefited by a year's growth before pruning. It is a fact that trees planted before December 1st make roots by the spring, and it is also the case that late-planted fruit trees are frequently killed by being pruned at planting time.

The matter has been well discussed, and opinions are divided on it as I expected. My desire is to see fruit more intelligently cultivated, and every detail should be brought out that can help the cultivator. Mulching is valuable assistance to heavily cropped trees at this season. Some standard trees have borne for nearly ten years in succession here, where this has been carried out.—GEO. BUNYARD.

NOTES ON MYOSOTISES.

INVALUABLE as the common forms of *Myosotis dissitiflora* are for spring bedding arrangements, their usefulness is enhanced by their ready adaptation to pot culture for early flowering with slight forcing, especially in view of the improved size and colour of the flowers. A recent visit to the establishment of Mr. Virgo, in the warm, sheltered, and picturesque valley of Walton-in-Gordano, not far from the cosy little watering place of Clevedon, disclosed to me a sight not easily forgotten in healthy vigour and floriferousness. *Myosotises* were evidently at home, thousands of plants averaging a foot to 18 inches in diameter, planted in beds of about 8 feet in width, and collectively covering several acres, formed a floral ocean of the softest azure blue imaginable. The cutting and tying of the flowers for market was proceeding briskly; small bunches of from six to eight sprays were being packed into shallow boxes for dispatch to London, Birmingham, Manchester, Bristol, and other centres, where they always find a ready sale.

Careful selection has done much towards the improvement of the plant, coupled, no doubt, with good cultivation and the peculiar suitability of the soil in the neighbourhood for imparting the rich deep colour which is so much admired in the flowers, although by reports from different parts of the country it appears to adapt itself to almost any soil or situation. In this neighbourhood the soil appears to be of a rich ferruginous loam, resting on deep beds of carboniferous limestone—just the sort of soil that would produce the blue colour in the *Hydrangea*, and evidently in the case of *Forget-me-nots* its influence is somewhat similar.

The bulk of the plants are propagated annually by cuttings taken as soon as the plants have flowered, which is generally towards the end of June; these inserted in a frame placed in a cool shady corner root freely, and are then planted in their permanent quarters. Although this is the favourite way of propagating the stock, thousands are raised annually from seed with the object of improving the strain. Several distinct varieties have been selected at various times, and *Blue Perfection* is perhaps the best type of these large-flowering varieties, the flowers of which generally average from half an inch to three-quarters in diameter, and the colour is, as the name implies, a perfect blue. *Undulata* is a pretty fancy variety, with crimped or undulated edges to its flowers, which give it a very distinct appearance. This variety was awarded a first-class certificate at the Royal Botanic Society's show when exhibited there last year, and evidently deserves it. *Compactum* forms a close growing tuft of leaves, from which spring short, sturdy spikes, thickly set with large, well-formed flowers of a somewhat paler hue. This variety will evidently take a front rank for select spring bedding purposes. Several more promising varieties were undergoing a trial in a corner of the enclosure, but as their merits were of an uncertain

character it would be unwise to attempt to describe them. I enclose a sketch of the three varieties that are chiefly grown, but it unfortunately conveys but a faint idea of the lovely hue, yet a comparison of the older varieties of *dissitiflora* will render apparent the great strides that have been made in the improvement of the flowers from a florist's point of view.—M. COOMBE, *Ashton Court Gardens, Bristol*.

[The flowers represented are very large indeed, and indicate considerable improvement in varieties of the species in question.]

DEATH OF THE REV. J. T. BOSCAWEN.

It is our painful duty to announce the death of the Hon. and Rev. J. Townshend Boscawen, Rector of Lamorran, Cornwall. Mr. Boscawen, who was in his seventieth year, was a well-known figure in horticultural circles, and has all his life been a devoted horticulturist. Indeed, he used to boast that he was born a gardener, for in his father's garden at the rectory at Wooton, near Dorking, where he was born, he had his own garden, and there he cultivated the plants agreeable to his taste; and from that time onward to the day of his death he never relinquished his favourite pursuit. He was rector of Lamorran since 1849, and there his garden was his great delight. It is one of those gardens teeming with plants of great botanical and horticultural interest, and the attraction of which was not the decorative style of gardening, but the intrinsic value of the lessons that might be learned there. In vol. xxxiii. of the last series of this Journal, Mr. Luckhurst vividly describes the interesting place in the following words:—

"In a quiet, secluded valley, amidst steep hilly wooded slopes, in a cosy nook at the head of the waters of Lamorran Creek, away from the beaten track of the busy world's highway, is the residence of the Hon. and Rev. J. T. Boscawen, well known to men of science and horticulturists as a wise counsellor and friend, who, although thus living apparently apart from the world, is one of its most busy workers, ever ready to aid in promoting those arts which he loves and understands so well, and who has turned the very quietness and seclusion of his home to good account by solving many a horticultural problem, evolving lessons of such value by the wonderful results obtained in his garden that I can think of no more fitting title for it than that of a book written by the hand of a master, every page of which contains lessons as novel as they are useful.

"It has very lately been my privilege to enjoy the hospitality of Mr. Boscawen—to see his garden, to study the lessons which it teaches, and in some measure to grasp their meaning, sufficiently so I hope to enable me to explain their full significance, and to show how what is really a great and pioneer work may be accomplished within small bounds and without many of those facilities which by many gardeners are considered indispensable to success. It was not long ago that I strongly enforced the importance of planting objects of interest in gardens. At Lamorran this principle was long ago understood and acted upon, and the result in this sense is a garden so abounding in plants and trees that are alike so varied and beautiful as to positively embarrass one. It is a veritable storehouse of treasures rich and rare, so skilfully cultivated and arranged in such good taste as to be always fresh and always attractive."

FLAVOUR OF MELONS.

A FEW weeks ago I purchased half a dozen Melons for a banquet. They were nearly perfect in appearance, a kind well known to be a prizetaker, were very heavy in proportion to size, large and of fine form, and the aroma was rich and almost overpowering. The vendor of these fine fruits has had much experience as a fruit purchaser and salesman, and he is highly trusted. He recommended them (with a large consignment of other purchases) as being Melons which it would be difficult to surpass. Many gentlemen were at this banquet who have high-class gardens of their own and know the quality of fine fruit, but certainly did not have their palates gratified by the flavour of the Melons. Without exception they were flavourless, though possessed of every other desirable quality. This certainly was an experience not conducive to the advancement of the system of judging Melons by sight.—M. T.

CARNATIONS GERMANIA AND MRS. REYNOLDS HOLE.

GERMANIA is an excellent yellow self Carnation. The blooms are a soft canary tint, the flowers full and well formed, and the petals of good substance. The calyx is long and of uniform size, pointed at the apex, and expands with that evenness and uniformity which renders artificial help needless. Far too many of our best flowers among Carnations have an ugly pear-shaped pod which bursts on one side, thereby impairing the beauty of the blooms, but the one under notice is quite different. Luckily, too, it possesses an excellent constitution and produces plenty of good "grass" for layering purposes. It is also freely flowered, the later blooms reaching a good size. I have a few plants of this beautiful variety now in flower, having been grown in a cool house during the winter; the first flowers were fully $2\frac{1}{2}$ inches across, and could have been made to appear much larger by the aid of tweezers had they been required for exhibition purposes. It is, however, unfortunately devoid of fragrance.

Speaking of Carnations reminds me of the charming new colour we have in Mrs. Reynolds Hole, a mixture probably of apricot and salmon,

which is simply unique; but apart from its novel and striking colour it has but little to recommend it; indeed, one very large grower of Carnations in referring to this particular variety expressed himself thus a year ago: "It has but one good quality, all the rest are bad," the one good quality being the colour. The growth is tall and straggling, and in constitution it is far from the best, many having cankered and perished during the past winter. In the first place an abnormal swelling has set in, which eventually burst, and decay was the result. This may have been caused by insects, which played sad havoc with many thousands of Carnations, and the season of 1888 was altogether opposed to Carnation growing. I had good hopes of this Carnation when I flowered it a year ago, for then it appeared strong and robust, sufficiently so to induce our purchasing largely, but the plants exhibited a changed character when they were unpacked, the growth being much weaker. The "grass" is neither so abundant nor so vigorous as heretofore, and a good constitution is a very important item towards popularising flowers such as the *c*; and it will be interesting to note how these new comers will figure in the anticipated Carnation trial at Chiswick.—J. H. E.

STRAWBERRY LATEST OF ALL.

MR. LAXTON of Bedford, raiser of Noble, A. F. Barron, Pioneer, King of the Earlies, and other fine Strawberries, brings before our notice a new late variety, which bids fair to form a valuable addition to the ranks of this delicious fruit. It is stated to be a seedling from British Queen crossed with Helena Gloede, ripening from ten days to a

FIG. 3.—STRAWBERRY LATEST OF ALL.

fortnight after the former. The faults of British Queen are its tender constitution and uncertain bearing qualities; but Latest of All, while fully equal to its parent in flavour, is said to be much more hardy, to thrive in any soil where Strawberries succeed, and to be very prolific and continuous in bearing. The habit is described as "vigorous but dwarf, the foliage thick, leathery, and remarkably downy, rendering this variety able to resist the attacks of mildew to which many late sorts are liable." The specimen fruits received, one of which is represented by the engraving (fig. 3) are conical and sometimes corrugated fruits of extraordinary size. The colour is dark red next the sun, and paler in the shade; seeds small and prominent. The flesh is firm, white, juicy, and richly flavoured, with somewhat of the Pine or Hautbois flavour. We cannot say anything more commendatory of Latest of All than that it is a fitting and worthy companion to Noble.

NOTES ABOUT STOVE PLANTS.

SOME stove plants are frequently grown in too high a temperature during the summer months. Artificial heat only tends to make them grow quickly, and in consequence they do not possess the solidity that is necessary to insure satisfactory flowering. This is not the sole cause of failure; they are often overshadowed, an evil that cannot be too carefully avoided.

POINSETTIAS.

Unfortunately in most gardens cold frames are not provided in such quantity as are really necessary, though they are amongst the most useful of glass structures for many plants during the summer months. Where vegetable forcing is carried out on a large scale there is generally a good number at disposal at this

season of the year. Poinsettias that were rooted in May, and are now in 6-inch pots, will be much better in cold frames than in heated pits. Any plants that have not taken freely to the new soil may be left to come forward with the next supply. Before placing them in cold frames it is important that they be carefully prepared for the change by exposing them to more air and a lower night temperature. The frames should be closed early in the afternoon while the sun is upon them, which will assist in maintaining a suitable night temperature. When the plants show signs of vigorous growth the lights may be thrown off during the day, but for some time ventilation will not be necessary at night. Discontinue shading as early as possible, and then the plants will grow strongly and possess the solidity that is essential to the production of good heads. Cuttings may still be rooted in thumbs and then transferred into 4-inch pots, which will be large enough for all propagated during the next two or three weeks. Pot these plants moderately firm in good loam, sand, and one-seventh of manure, which assists in promoting firm growth. Leaf mould may be used in the cutting pots, but if employed in the compost afterwards it promotes a too rapid growth, resulting in the plants becoming tall and soft, consequently only producing small bracts.

STEPHANOTIS FLORIBUNDA.

Early plants that have produced a profusion of bloom will be better without artificial heat. In addition, the structure in which the plants are grown may be ventilated during the hottest part of the day as freely as a greenhouse. This will insure firm sturdy growth and well-ripened wood, that will be certain to yield abundance of bloom another year. Those who think that a close moist atmosphere is essential to keep this plant growing in order to obtain blooms will find that this end can be accomplished by the method of culture advised. Perhaps the flower trusses will not be produced quite so quickly, but it is certain that the plants are being prepared for flowering profusely another year.

If mealy bug infests the plant it invariably makes headway after the flower trusses appear, and cannot well be dislodged by a free use of the syringe. Under these conditions every attempt should be made to exterminate it out now. If the plants are grown in pots and their shoots trained to strings they may be taken down and the plants thoroughly washed with a solution of 1 oz. of petroleum to a gallon of water. If the plants cannot be removed the same application may be applied to them where they are, and repeated again in about three weeks. Some care is needed after syringing to protect the plants from the sun until the whole of the oil has evaporated. This will take three or four days. Do not overshadow them, or it will prove as injurious to the plants as if they were left exposed while the oil is upon the foliage. It must be kept in mind that the *Stephanotis* requires no shade from the sun except when applications of this nature are applied.

BEGONIAS.

Very frequently these are grown in a too high temperature, and consequently the beauty they would display in a suitable medium is destroyed by the plants running up tall. They are more suited for an intermediate structure than a warm stove, although they are useful in the latter during the winter and early spring months. Two of the most useful Begonias for the conservatory from January to the end of April are *B. manicata* and *B. hydrocotylifolia*. The latter is the better of the two, on account of its lasting properties. Its pink flowers and flower stems are very effective standing above other dwarf flowering plants. *B. manicata* is the earlier, and on this account is valuable. These are looked upon as stove Begonias, and are frequently grown for the embellishment of that structure. This is a mistake, for the flowers are soon over—in fact, they are scarcely worth growing for the stove alone.

Plants for next year are now in 3-inch pots in which they were inserted. The growing end of the plant roots so freely that all old plants are thrown away as soon as the requisite number of cuttings have been inserted. We invariably stand them in a late vinery. They are well rooted now, and growing freely. They should be placed in 5 and 6-inch pots in a compost of loam, sand, one-seventh of manure, and about one-third of leaf mould. They will be at home in cold frames until damp compels their removal to a drier position. They are safe until they come into flower in a temperature of 50°. A portion of the plants can be introduced into a temperature 10° higher to bring them into flower, but they need careful hardening afterwards, or their flowers fall when removed to a house where the temperature only ranges about 45° to 50°.

Such Begonias as *Ingrami*, *Knowsleyana*, *semperflorens rosea*, *earminea*, and others should now be transferred to 5-inch pots, and grown in cold frames. They need shading from the bright rays of the sun, and abundance of air during the day, after they display signs of rooting freely in the fresh compost.

Cuttings of all except *Knowsleyana* may still be inserted, as well as good supplies of *nitida* and its variety *rosea*. Sow seed of the old *semperflorens*. Cuttings of *Carrieri* may be inserted in quantity, even if they are only flowering shoots, which will lengthen, and be useful for furnishing purposes. If the cuttings of this have no eye at the base they must not be pinched after they are rooted, for they will fail to break again into growth. This is one of the most useful Begonias that can be grown, as it can be flowered either in summer or winter in the smallest pots, or can be grown into a good sized bush. Its habit of growth for this purpose is all that can be desired.—W. BARDNEY.

NATIONAL ROSE SOCIETY.

ANNUAL EXHIBITION AT THE CRYSTAL PALACE.

ROSES and Royalty are potent factors in awakening the enthusiasm of the general public, hence it need hardly be said that the Crystal Palace was largely attended on Saturday last, and were the crush of a holiday crowd the end and aim of the Society devoted to the interests of the Rose, then must their exhibition in this year of grace be classed as the most successful that they have ever held. Many species of the Rose being Persian plants, it was in accordance with the fitness of things that our visitor, the Shah, should be taken by his English hosts to see the rarest and most radiant of flowers, the brightest jewel in Flora's richly gemmed crown, as we grow it here in England. Possibly the gardeners of Teheran do not grow Roses as we grow them, for nowhere are they more cared for or more dearly cherished than in this country, but there may be some love for the queen of flowers in the Oriental breast for all that; therefore, let us hope that the dusky potentate enjoyed his visit, and gained instruction from it too.

Rarely, if ever, has a finer show been held than that of the National Society this year. Considering the trying weather, for hardly a drop of rain had fallen for several weeks, the exhibits as a whole were excellent, and prizewinners, who have triumphed over no ordinary difficulties, have ample reason for self-congratulation. To southern growers these remarks especially apply; many of them must, after the long spell of dry, hot weather, have awaited the show day with impatience. A magnificent stand was that of the famous Yorkshire exhibitors, Messrs. Harkness, in the chief class. In the amateurs' division the great features were the stands of Messrs. Grant and Lindsell. As to varieties, Ulrich Brunner, Mrs. J. Laing, Her Majesty, Lady Mary Fitzwilliam, Marie Baumann, Marquise de Castellane, Charles Darwin, and Madame Susanne Rodocanachi were in excellent condition amongst the H.P.'s, while such fine varieties as Madame Gabriel Luizet, Merveille de Lyon, Charles Lefebvre, Heinrich Schultheis, Boieldieu, and Violette Bouyer were less noteworthy. The queen of the Teas was undoubtedly Comtesse de Nadaillac; and Caroline Kuster, Souvenir de Paul Neyron, Niphetos, Francisca Kruger, Madame Cusin, and Souvenir d'Elise Vardon were also well represented.

As the public were admitted to the Show long before the work of reporting was half over, and quickly packed the tent to excess, a more difficult and unpleasant task than that of taking notes could not well be imagined. If a few errors have crept into the following report it is hoped that they will, under the circumstances, be pardoned. So fine a show was worth more attention than could possibly be given to it.

NURSERYMEN'S CLASSES.

Following the order of the schedule we first find five important classes devoted to nurserymen, divided into two divisions, exhibitors in the one not being allowed to compete in the other.

Class 1, seventy-two distinct, single trusses.—The six stands in this one class formed a display of great beauty and interest. There was not one in which some good blooms were not observable, and the leading boxes were, if anything, above the average. The first prize consisted of a valuable challenge trophy and £6, and it was won by Messrs. Harkness and Son, Bedale, Yorks, who have made rapid strides towards the front during the last few years, and on the present occasion exhibited a magnificent collection of flowers, fitted to compare with the best stands of former days. Their northern position placed them at an advantage with their southern rivals, as the hot, dry weather in the south has hurried on the blooms too rapidly, but this should detract little from the credit due to them. They showed large, substantial, well built up flowers, admirably finished, true, bright, and clear in colour, in fact in the perfection of show condition. The boxes were arranged in threes, with one as an apex and two as a base, and the varieties were:—Upper box, back row: Ulrich Brunner (a superb bloom), Mrs. J. Laing, Mrs. Jowitt (these were a splendid trio), Duchesse de Vallombrosa, Horace Vernet, Hippolyte Jamain (weak), Madame A. Lavallée, and Her Majesty (superb). Middle: Violette Bouyer, Lord Macaulay, Souvenir d'Elise (very beautiful), Rosieriste Jacobs, Amazone, Duke of Connaught, Marie Rady, and Louis Van Houtte. Front: La Duchesse de Morny

(beautiful), Madame G. Luizet, Charles Darwin, Niphetos (weak), Duc de Rohan (splendidly coloured), La France, Harrison Weir, and Merveille de Lyon. Lower left hand box, back row: Devienne Lamy (very fine), Lady M. Fitzwilliam (very large but coarse), François Michelin, Madame Montet, Comtesse d'Oxford, Madame Hippolyte Jamain, Etienne Levett, and Innocente Pirola. Middle: Captain Christy, A. K. Williams, Marie Verdier, John Stuart Mill (small but beautiful), Princess of Wales, Penelope Mayo, Silver Queen, and May Quennell. Front: La Fille de St. Denis, Royal Standard, Charles Lefebvre (very weak), Etoile de Lyon, Lady F. Cavendish (small but very fresh), La Boule d'Or, Dr. Sewell, and Heinrich Schultheis (very large). Lower right hand box, Back row: Benoit Comte (very fine), Marquise de Castellane, Bartolomeo Joubert (superb), Mons. Noman, Paul Neyron, Princess Beatrice, Mons. Alfred Dumesnil, and Queen of Queens. Middle: Pride of Waltham (good), Abel Carrière (weak), Souvenir d'un Ami (very good), Baronne Hausmann (beautiful), Comtesse de Nadaillac, Mons. E. Y. Teas, Boieldieu (poor), and Général Jacqueminot. Front: Maréchal Vaillant, Madame Eugène Verdier, Annie Wood (poor), Madame Angèle Jacquier, Reynolds Hole, The Bride, Countess of Rosebery, and Madame Hippolyte Jamain (very fine indeed). Generally speaking the H.P.'s were very strong, the Teas a little weaker. Last year's winner, Mr. Frank Cant, Colchester, had a beautifully fresh and well-finished lot of blooms, and it speaks most highly for the first prize collection that, fine and even as were the Colchester blooms, they were distinctly in the rear. For once the powerful southern exhibitor was decisively beaten. He showed Niphetos superbly, and Madame de Watteville was also beautiful. Amongst the H.P.'s Duke of Teck was in exquisite condition, though not large, and Her Majesty was grandly shown; Comtesse d'Oxford was large, but coarse; Alfred Dumesnil was very good. The Teas were the strongest feature of the boxes. They are not often seen so beautifully finished as are Mr. Frank Cant's flowers. Messrs. R. Mack & Son, Catterick, York, were placed third, and their collection was a highly creditable one, comprising many fine blooms; Marie Baumann, Lord Macaulay, Comte de Raimbaud, Ulrich Brunner (superb), A. K. Williams and others were very strong indeed. Had the Teas been of proportionate quality it is questionable if Messrs. Mack would not have been higher placed. Mr. B. R. Cant, Colchester, was fourth. Two others competed.

Class 2, forty-eight distinct, three trusses of each.—This class was well filled. Five competed, and the display was an imposing one. Messrs. Paul & Son, Old Nurseries, Cheshunt, were placed first for a fresh well balanced collection of blooms, the individual examples clear, smooth, and well finished. Their names were as follows:—Back boxes (two); back row: Madame Susanne Rodocanachi (very large and glowing in colour, a fine Rose finely shown), Madame A. Lavallée, La France, Beauty of Waltham, Star of Waltham, Marshall P. Wilder, Capt. Christy, and Comtesse d'Oxford. Front: Grandeur of Cheshunt, Catherine Mermet, Mons. E. Y. Teas, Madame de Watteville, Chas. Lefebvre, Innocente Pirola, Duke of Teck, and The Bride. Front boxes; back row: Merveille de Lyon (very fine indeed), Marie Baumann (splendid), Marie Verdier, Abel Carrière, Her Majesty, Maurice Bernardin, Duchesse de Morny, and Reynolds Hole. Front row: Chas. Darwin, Souvenir d'Elise, Etienne Levett, Queen of Queens, Xavier Olibo, Niphetos, A. K. Williams, and Madame Norman Néruda. Mr. Frank Cant followed closely, also with an even and excellent lot of flowers. Perhaps the best were Marie Cointet, Marie Van Houtte, Pride of Waltham, and Duke of Teck. Mr. B. R. Cant was third, and Messrs. Cranston fourth, one other competing. Many excellent examples were to be found in these stands, and would have been noted had circumstances permitted of their being singled out.

Class 3, forty-eight distinct, single trusses.—This and the two following classes were distinct from the preceding. Messrs. Cooling & Sons, Bath, won with an admirable and well-finished collection, only lacking some strong back row flowers to be well above the average. The varieties were:—Back row: Marshall P. Wilder, Madame Schubert, Gabriel de Peyronney, Abel Grand, Leopold I., Merveille de Lyon, Fisher Holmes (very good), Madame Eugène Verdier, Comtesse d'Oxford (very good), Her Majesty, Star of Waltham, Madame Hippolyte Jamain, Alfred Colomb (very rich), François Michelin, Madame G. Luizet, and Madame Marie Verdier. Middle row: Lælia, Prof. Sewell, Mrs. Laing, Black Prince (very good), Pride of Waltham, Comte de Flandres, Baronne de Rothschild, Marie Rady, The Bride (exquisite), Pierre Notting, La Duchesse de Morny (very fine), St. George, Souvenir d'Elise Vardon, A. K. Williams, Magna Charta, and Le Havre. Front row: Louis Corbet (very bright), Duchess of Leeds, Ella Gordon, La France, Le Havre (shown twice), Madame Caillat, Reynolds Hole, Silver Queen, Baronne Hausmann, Souvenir de M. Paul Neyron, Madame de Wolfs, Ulrich Brunner, Souvenir de Spa, Catherine Mermet, Dr. Andry, and Captain Christy. Messrs. Keynes, Williams & Co. had a capital stand, which had been placed in another portion of the Show, and was not at first discoverable. They secured second prize with something to spare, the remaining awards going to Messrs. G. & W. H. Burch, Peterborough, and J. Jefferies & Son, Cirencester. There were several other competitors.

Class 4, twenty-four distinct, single trusses.—A charming box from Mr. G. Prince, 14, Market Street, Oxford, secured first place with twenty-four singles. The varieties were all stated to have been grown on the seedling Briar, and were as follows:—Back row: Marie Baumann, Her Majesty, Reynolds Hole, Niphetos, Madame Victor Verdier, Comtesse de Nadaillac, A. K. Williams, and Queen of Queens. Middle row: Merveille de Lyon, Horace Vernet, Jean Ducher, Earl of Dufferin, Madame G. Luizet, Marie Rady (very beautiful), Catherine Mermet

and Charles Darwin. Front row: Duchess of Bedford, Madame de Watteville, Baronne Hausmann, Alba Rosea, Exposition de Brie, Lady Mary Fitzwilliam, Xavier Olibo, and Duke of Teck. These were not phenomenal blooms, but of good and even quality. Mr. J. Walker of Thame, famed for Narcissi, also showed well, and was placed second; the remaining prizes falling to Messrs. Mattock, Oxford, and G. Bunyard and Co., Maidstone.

Class 5, twenty-four distinct, three trusses of each.—Messrs. G. and W. H. Burch here improved materially on their previous position with twenty-four trebles, winning well; they showed Maurice Bernardin, Captain Christy, Alfred Colomb, Merveille de Lyon, Ulrich Brunner, Her Majesty, Countess of Oxford, Queen of Queens, Duc de Rohan, Madame Willermoz, Star of Waltham, and Catherine Mermet. Front row: Madame Cusin, Camille Bernardin, Madame de Watteville, Marie Rady, Souvenir d'Elise Vardon, A. K. Williams, Innocente Pirola, Horace Vernet, La France, Xavier Olibo, The Bride, and Marie Baumann. These were an excellent lot, and richly deserved the award. Messrs. Keynes, Williams & Co. were second; Messrs. Jefferies, Cirencester, third; and Messrs. Cooling fourth.

AMATEURS.

The exhibits in this section formed a splendid display. Messrs. Grant and Lindsell were in magnificent form, and it is to be deeply regretted that a complete and critical reference to their stands was prevented by the crush of people around the boxes. We succeeded in snatching the names of the varieties, but to do justice to such excellent collections as these a close and careful inspection was absolutely necessary.

Class 6, forty-eight distinct, single trusses.—This was the most important of the amateurs' classes, the first prize being the valuable champion challenge trophy and £6. This class is invariably a highly interesting one, and on the present occasion two former winners in Mr. W. J. Grant, Hope End, Ledbury, and the Rev. J. H. Pemberton, Havering-atte-Bower, Essex, were in competition, as well as other well known exhibitors. The contest lay between the two named, but the issue was decided without difficulty, Mr. Grant winning by many points with a superb collection, in which it would have been difficult to detect a weak spot. The flowers throughout were substantial, rich in colour, and refined—such, in fact, as Rose growers love to linger over, but from which they were literally dragged away on the present occasion by a living stream. The varieties were Comtesse d'Oxford, Madame Victor Verdier, Niphetos, Le Havre, Duchesse de Vallombrosa, Duke of Edinburgh, Ulrich Brunner, Madame Lavallée, Marie Cointet, Marie Rady, Madame Gabriel Luizet, Duke of Wellington (superb), Madame Rodocanachi, Xavier Olibo, Caroline Kuster, Prince Arthur, Capt. Christy, Comte de Raimbaud, La France (so named, but apparently Capt. Christy), Alfred Colomb (superb), François Michelin, Louis Van Houtte, Madame E. Verdier, A. K. Williams, Her Majesty, Marie Baumann (a magnificent bloom), Etienne Levett, La Rosière, Anna Olivier, Horace Vernet, Madame H. Jamain, Dr. Andry, La Duchesse de Morny, Earl of Dufferin, Pride of Waltham, Dingee Conard, Star of Waltham, Jean Soupert, Madame Crapelet, Pierre Notting, Merveille de Lyon, Chas. Darwin, Mrs. J. Laing, Beauty of Waltham, Heinrich Schultheis, Dupuy Jamain, Camille Bernardin, and Reynolds Hole. The Rev. J. H. Pemberton had a very handsome and even stand, little, if any, below his best form, the flowers neat and good. He easily secured second prize, the third going to Mr. S. P. Budd, Bath; and the fourth to Mr. J. H. Pitt, Maidstone.

Class 7, twenty-four distinct, three trusses of each.—Mr. Grant was again victorious here. He had a beautiful stand of triplets, the varieties being Marie Baumann, Madame Rodocanachi, Marie Finger, Mons. Boncenne, Louis Van Houtte, Pride of Waltham, Chas. Darwin, Her Majesty, Ulrich Brunner, Marie Verdier, Merveille de Lyon, Le Havre, Marie Rady, Duchesse de Vallombrosa, La France, Camille Bernardin, Earl of Dufferin, Madame G. Luizet, Capt. Christy, Dr. Andry, La Rosière, Alfred Colomb, Dupuy Jamain, and Comtesse d'Oxford. Mr. S. P. Budd was second, but there were no other competitors.

Class 8, thirty-six distinct, single trusses.—This produced in the first prize lot of Mr. E. B. Lindsell, Hitchin, one of the most beautiful collections of Roses ever seen at the National Show. Perpetuals and Teas were alike magnificent, and collectively formed a stand with which the other competitors were quite unable to cope with any hope of success. The blooms were large and substantial, yet shapely and refined, with rich lustrous colour and admirable finish. The varieties were:—Back row: Marie Rady, Her Majesty, Xavier Olibo, Niphetos, Dr. Andry, Marie Baumann, La France, Fisher Holmes, Madame G. Luizet, A. K. Williams, Merveille de Lyon, and Ulrich Brunner. Middle row: Emilie Hausburg, Marie Verdier, Beauty of Waltham, Capt. Christy, Madame Victor Verdier, Violette Bouyer, Louis Van Houtte, Comtesse de Nadaillac, Caroline Kuster, Catherine Mermet, Duchess of Bedford, and Francisca Kruger. Front: Duchesse de Caylus, Jean Ducher, Mons. Noman, Victor Hugo, Viscountess Folkestone, Camille Bernardin, Innocente Pirola, Madame de Watteville, Prince Arthur, Princess of Wales, Madame Cusin, and La Boule d'Or. Mr. J. Brown, gardener to Mrs. Waterlow, Reigate, was an excellent second; and Mr. E. West, Reigate, third.

Class 9, eighteen distinct, three trusses of each.—Mr. Lindsell was again victorious here. Had he entered in the champion class Mr. Grant would have had a foeman well worthy of his steel. His triplets were Xavier Olibo, Her Majesty, A. K. Williams, Comtesse de Nadaillac, Horace Vernet, Jean Ducher, Merveille de Lyon, Marie Rady, Marie Baumann, Niphetos, Caroline Kuster, Louis Van Houtte, Ulrich Brunner,

Mons. E.Y. Teas, La France, Catherine Mermct, and Madame Victor Verdier—a grand lot of blooms.

Class 10, twenty-four distinct, single trusses.—Mr. G. Christy, Westham, took premier honours here with Dr. Andry, Charles Lefebvre, Mons. Noman, Camille Bernardin, Marie Rady (very fine), Louis Van Houtte, Merveille de Lyon, Princess Beatrice, Marie Baumann, L'Eclair, Beauty of Waltham, Marie Finger, Jean Souper, Fisher Holmes, Madame Luizet, Duke of Wellington, La France, Ulrich Brunner, Countess of Rosebery, Madame C. Wood, Alba Rosea, A. K. Williams, Capt. Christy, and Duke of Teck. The Rev. A. Foster Melliar, Ipswich, was second; Mr. P. B. Haywood, Reigate, third; and Mr. Gurney Fowler, Woodford, fourth.

Class 11, twelve distinct, three trusses of each.—Triplets were here but moderately shown, the best being those from Mr. G. Christy, who had Comtesse de Serenyc, Madame Gabriel Luizet (fresh and good), Marie Rady, La France, Marie Baumann, and Merveille de Lyon in his back row, and Dr. Andry (small, but richly coloured), Innocente Pirola (very good), Mons. Noman, Duke of Wellington, Captain Christy, and L'Eclair in the front. The Rev. A. Foster Melliar followed, but his blooms were small, and some faded. The Rev. W. H. Jackson, Slaysden, Beds, was third; and Mr. A. Evans, Oxford, fourth.

Classes 12 to 16.—These were for eighteen, twelve, nine, and six blooms respectively, with one of six trebles. In the first the Rev. L. Garnett, Christleton Rectory, Chester, won with Beauty of Waltham, Charles Lefebvre, Star of Waltham, Mrs. John Laing, Dupuy Jamain, Horace Vernet, Come de Rainbaud, Her Majesty, Lord Bacon, Madame A. Lavallée, Prince Arthur, Comtesse d'Oxford, Comtesse de Camondo, Comte E. Labryère, Marie Verdier, Xavier Olibo, Alfred Colomb, and Mrs. Laxton. This was a fresh and delightful stand, with well finished blooms. Mr. Edward Mawley, Rose Bank, Berkhamstead, was second, Marie Baumann being his best bloom. Mr. J. E. Backhouse, Henworth Grange, Darlington, was a close third, and Miss F. Baker, The Hollies, Reigate, fourth. Lieut.-Col. Standish Hore, St. Asaph, was first with twelve, a bright, well-finished lot, comprising Marie Finger, Louis Van Houtte, Marie Verdier, Beauty of Waltham, Etienne Levet, Belle Lyonnaise, Le Havre, Charles Darwin, Xavier Olibo, A. K. Williams, Hon. Edith Gifford, and Alfred Colomb. Mr. O. G. Orpen was a very good second, Messrs. Whittle and R. L. Knight both showing well for the remaining prizes. Mrs. G. L. Times, Hitchin, won with nine blooms, staging François Michelin, Alfred Colomb, Captain Christy, Star of Waltham, Her Majesty, Emilie Hausburg, Pierre Notting, Xavier Olibo, and Madame Laeharme, in good form. Second, the Rev. J. S. Taylor, Evesham; third, Mr. H. V. Edwards, Derby; fourth, Mr. G. Moules, Hitchin. Mr. Edward Horne, Park House, Reigate, had François Michelin, La France, Pierre Notting, Duke of Teck, Marie Baumann, and La Duchesse de Morny in fair condition in the class for six, and won. Mr. C. Knifton, Duffield, second; Mrs. Ponsford, Reigate, third; and Mr. J. Rawlins, Cirencester, fourth. Mr. J. Mallender, gardener to Miss Mellish, Hodsock Priory, Worksop, won with six trebles, showing La France, A. K. Williams, Violette Bouyer, Alfred Colomb, Marie Finger, and Louis Van Houtte. Mr. Narrowway, Oxford, was second; Mr. W. Boyes, Derby, third; and Mr. P. G. C. Burnard, Reigate, fourth.

Seventeen to twenty inclusive were extra classes, the first being for amateurs who had never won a prize at an exhibition of the National Rose Society. Six blooms only were asked for, and Mr. M. Whittle, Leicester, won with François Michelin, Louis Van Houtte, Her Majesty, La France, Capt. Christy, and Marie Rady, Messrs. C. J. Grahame, S. Marten, and Miss E. B. Denton following. For six blooms grown within eight miles of Charing Cross, Mr. J. Bateman, 72, Twisden Road, N.W., followed up previous victories by easily securing first place. He had Etienne Levet, François Michelin, Ulrich Brunner, Baronne de Rothschild, Merveille de Lyon, and Marquise de Castellane in capital condition. Mr. Frederici, Muswell Hill, was second, Mr. Northover, Wimbledon, third, and Mr. W. B. Faulkner, Wimbledon, fourth. The Rev. J. H. Pemberton won with six new Roses, showing Earl Dufferin, Her Majesty (in beautiful condition), Viscountess Folkestone, Lady Helen Stewart, Sir Rowland Hill, and Ethel Brownlow. Mr. T. W. Girdestone was second, and the Rev. A. Foster Melliar third. With six single trusses of any Hybrid Perpetual the Rev. J. H. Pemberton won, showing a neat lot of Earl of Dufferin. Second, Mr. G. Christy, with Marie Baumann. Third, Mr. E. Horne, with La France. Fourth, Mr. W. G. Grant, name undiscoverable.

TEAS AND NOISETTES—NURSERYMEN.

Teas and Noisettes were a rich and beautiful display. Considered collectively they were well up to the average, the flowers being large, substantial, well formed, fresh and clear. That they were greatly admired goes without saying, but unhappily there was no possibility of more than a cursory inspection.

Class 21, twenty-four blooms, distinct.—Mr. G. Prince's blooms were in the best condition, and he scored a ready victory, which must have proved highly gratifying to him, considering the powerful opposition. His back row flowers were Comtesse de Nadaillac, Niphetos (magnificent), Catherine Mermct, The Bride, Souvenir d'un Ami, Hon. Edith Gifford, David Pradel, and Jean Ducher. Middle row: Marie Van Houtte, François Kruger, Comtesse Panisse, Princess of Wales, Innocente Pirola, Souvenir de Thérèse Levet, Etoile de Lyon, and Alba Rosea. Front row: Madame Cusin, La Princesse Vera, Madame de Watteville, Souvenir d'Elise, Madame Lambard, Madame Hippolyte Jamain, Madame Jacquier, and Mdlle. Marie Arnaud. Mr. Frank Cant was a good second. He is usually very strong with Teas, but some of his blooms were a little past. Mr. B. R. Cant was third.

Class 22, eighteen distinct.—Here Messrs. J. Burrell & Co., Cambridge, were most successful with a delightful stand. The varieties were:—Back row: Caroline Kuster, Madame Cusin, The Bride, Madame de Watteville, Princess of Wales, and David Pradel. Middle: Comtesse de Nadaillac, Niphetos, Madame Jacquier, Innocente Pirola, and Adam. Front: Amazone, Catherine Mermct, La Boule d'Or, Souvenir d'un Ami, Luciole, and Marie Van Houtte. Messrs. Jefferies were second, Mr. Mattock third, and Messrs. Bunyard fourth, all with beautiful stands; indeed, this was a highly interesting and attractive class.

Class 23, twelve trusses of any Tea or Noisette, Maréchal Niel excepted.—How fine the beautiful Comtesse de Nadaillac is this year will have been gathered from the frequency with which it has been named in previous classes, and in the present case it composed three out of the four prize stands. Mr. Prince was first with a grand lot, Mr. Frank Cant being second, and Mr. Mattock fourth, the third prize going to Mr. B. R. Cant for Madame de Watteville.

Class 24, eighteen distinct, three trusses of each.—Teas in triplets were beautifully shown by Mr. Frank Cant. The varieties were Ethel Brownlow, Niphetos, Madame de Watteville, Comtesse de Nadaillac (splendid blooms), Etoile de Lyon, Souvenir d'un Ami, Hon. Edith Gifford, Marie Van Houtte, Innocente Pirola, Catherine Mermct, Madame Cusin (magnificent), Souvenir d'Elise Vardon, Madame Lambard, Princess of Wales, The Bride, La Boule d'Or, Madame Jacquier, and Francisca Kruger. These formed one of the most charming stands in the Show. Mr. G. Prince, showing Niphetos, Comtesse de Nadaillac, Madame Cusin, Souvenir d'un Ami, and Souvenir d'Elise Vardon superbly, was a very close second, and Mr. B. R. Cant third.

TEAS AND NOISETTES—AMATEURS.

Classes 25 to 30, for eighteen, twelve, nine, and six blooms, twelve trebles, and six single trusses of any Tea or Noisette respectively formed a beautiful and greatly admired section. The flowers were finely shown throughout. Mr. Grant won the silver cup and money prize offered for eighteen blooms with a delightful stand, composed of Comtesse de Nadaillac, Innocente Pirola, Francisca Kruger, Caroline Kuster, Souvenir d'un Ami, Marie Van Houtte, Souvenir de Thérèse Levet, Madame Bravy, Jean Ducher, Souvenir de Paul Neyron, Madame Lambard, Niphetos, Madame Cusin, Anna Ollivier, Madame Margottin, Souvenir d'Elise, Catherine Mermct, and the Hon. Edith Gifford. These were large, fresh, and well formed flowers, proportionate in quality to the H.P.'s so finely shown by the same exhibitor in other classes. The Rev. F. R. Burnside was a very good second with fresh and well finished flowers; the Rev. Hugh Berners a close third, and the Rev. A. Foster-Melliar, Sproughton Rectory, Ipswich, fourth. In the wars of the Roses we have still a church militant, and its representatives here fought well. A superb stand of twelve came from Mr. Lindsell, and won easily. The varieties were Niphetos (enormous in size, but somewhat coarse), Madame Cusin, Jean Ducher, Comtesse de Nadaillac, La Boule d'Or, Souvenir d'Elise Vardon, Catherine Mermct, Rubens, Madame de Watteville, Caroline Kuster, Innocente Pirola, and Princess of Wales. The points of such flowers as those of Mr. Lindsell and Mr. Grant it would have been a pleasure to study. Mr. O. G. Orpen, Colechester, was second, also with a beautiful stand; the Rev. J. H. Pemberton, third; and Mr. E. M. Bethune, Horsham, fourth. The Rev. L. Garnett won with nines, really beautiful examples of Comtesse de Nadaillac, the Hon. Edith Gifford, Caroline Kuster, Madame Bravy, Francisca Kruger, Madame Cusin, Innocente Pirola, Perle des Jardins, and Comtesse Panisse; Miss F. Baker was second; Mr. W. Narrowway, third; and Mr. R. G. Tucker, Farningham, fourth. Lt.-Colonel Standish Gore had the Hon. Edith Gifford, Madame Cusin, Princess of Wales, Comtesse de Nadaillac, Caroline Kuster and The Bride excellent in form in the class for six; the Rev. F. S. Taylor, Mr. E. Mawley, and Mr. G. Moules following. With triplets Mr. Grant once more demonstrated his superiority. His stand, which comprised Souvenir d'un Ami, Francisca Kruger, Souvenir de Paul Neyron, Madame Cusin, Jean Ducher, Innocente Pirola, Souvenir de Thérèse Levet, Catherine Mermct, Anna Ollivier, Comtesse de Nadaillac, and Niphetos, with one unnamed, was an admirable display of substantial, neat, and well finished flowers. The Rev. J. H. Pemberton was second, the Rev. F. R. Burnside third, and Mr. J. Brown fourth. Comtesse de Nadaillac was again shown in three out of the four stands in the last class for Teas, any variety. The Rev. F. R. Burnside scored his first win with a very neat box of it. Mr. Lindsell was very little way behind, also with the Comtesse. The Rev. L. Garnett was third with Madame Cusin, and the Rev. A. Foster Melliar fourth with Comtesse de Nadaillac. Class 31, for a basket, vase, or épergne of Teas or Noisettes, to be arranged with Rose foliage, brought only two competitors. Mrs. Edward Mawley won with a beautiful basket of flowers, Miss Agnes Bloxam taking second prize. This class appeared to have been left by common consent to the ladies, who certainly ought to have an opportunity afforded them, but we should have liked to see more competition.

OPEN CLASSES.

These chiefly consisted of stands of one variety, and in all cases twelve single trusses were asked for.

Class 32, any yellow except Maréchal Niel.—The prize stands here were all excellent. Mr. Grant, showing Caroline Kuster finely, occupied his usual position of first. Mr. Frank Cant followed with Comtesse de Nadaillac, this variety also securing third prize for Mr. Prince, and fourth for Mr. B. R. Cant.

Class 33, any white except Niphetos.—At last Merveille de Lyon was

shown in something like representative condition. Messrs. Harkness won with some very fine blooms of it. The prize list showed no award of second, but gave Mr. B. R. Cant, who had Niphetos in fine condition, third; and Mr. Frank Cant (The Bride) fourth.

Class 34, any crimson except Marie Baumann or A. K. Williams.—Alfred Colomb, which was not very strong in the majority of the stands, was well shown in this class. It was very fine indeed in Messrs. Cooling's first prize stand; and fresh and good, albeit small, in Messrs. Cranston's second prize box. Messrs. Harkness were placed third with Ulrich Brunner, excellent blooms; and Mr. J. Walker third with fair examples of Reynolds Hole.

Class 35, any dark velvety crimson.—Prince Camille de Rohan was given as an example of the colour required in the schedule, but it was not represented in the prize stands. Messrs. Paul & Son, Cheshunt, won with Reynolds Hole; Messrs. Keynes, Williams & Co. were second with the same variety; Mr. Grant third with Abel Carrière; and Mr. R. B. Cant fourth, also with Reynolds Hole.

Class 36, for Maréchal Niel, did not fill.

Class 37, Marie Baumann.—Mr. G. Mount, Canterbury, had a grand box of this noble Rose, and achieved a meritorious victory. He was followed in the order of their names by Messrs. Paul of Cheshunt, Bunyard, and Cranston, all of whom had good stands.

Class 38, Lady Mary Fitzwilliam.—A splendid stand of this variety came from Messrs. J. Cocker & Sons, Aberdeen. It represented one of the most beautiful of Roses in a condition approaching perfection. There was no more attractive stand than this in the whole section. Mr. B. R. Cant was second, and Mr. Frank Cant third.

Class 39, A. K. Williams.—Messrs. Paul of Cheshunt and B. R. Cant were the only contestants. The former won with a stand of very richly coloured flowers.

Class 40, Niphetos.—There was more competition in this than in any other class, and the boxes formed a very beautiful display. Mr. Frank Cant's stand was a magnificent one, the flowers being of exquisite form and purity. He was an easy first, the second prize going to Mr. Prince, and the third to Messrs. Paul, Cheshunt.

Class 41, Her Majesty.—The coarseness frequently observable in this variety was entirely absent from the first prize blooms of Messrs. Paul, Cheshunt. They were, perhaps, one of the best stands of this variety ever shown, being noteworthy for perfection of globular form, clearness of colour, and refined substance rather than mere size. Mr. Grant was second, and Mr. Frank Cant third.

Class 42, any Rose not previously mentioned.—This produced three splendid boxes. An exquisite stand of Madame de Watteville, admirably finished and delicately beautiful, secured the first prize for Mr. Frank Cant. A noble box of Ulrich Brunner, Mr. Grant's contribution, was placed second; and Comtesse de Nadaillac, well shown by Mr. Prince, was placed third.

Class 43, any new Rose except Her Majesty.—Messrs. Cocker & Sons were placed first with a splendid box of the beautiful new Rose Lady Alice, which, as shown, was generally admired. The blooms are admirable in form and substance, while the colour is a most pleasing soft blush shade, resembling that of Lady Mary Fitzwilliam. Mr. B. R. Cant was second with The Bride; and Messrs. Paul of Cheshunt third with Queen of Autumn, a crimson H.P. of good form and colour.

Class 44, twelve new Roses.—Mr. F. Cant won with the following—Vi-countess Folkestone, Mons. Mat. Baron, Her Majesty, Earl of Dufferin, Sir Rowland Hill, Duchess of Leeds, Grand Mogul, Silver Queen, Miss Ethel Brownlow, Primrose Dame, Mrs. J. Laing, and The Bride. Messrs. Paul of Cheshunt were second, and Mr. B. R. Cant third.

Class 45, three trusses of any new Rose, with a ground plant.—This class was provided for Roses either not yet in commerce or not distributed before November, 1888. The prize was a gold medal, and it was won by Mr. Prince with his beautiful white Tea Souvenir de S. A. Prince, which has been previously described.

Class 46, garden Roses.—These formed an interesting display, though small, only two competing. H.P.'s were totally excluded, also exhibition Teas and Noisettes, so classed in the National Society's catalogue. Messrs. Paul, Cheshunt, won. It was difficult to get the names of their flowers, as they were half hidden in the stands, which in turn were surrounded by a dense throng; but such beautiful liliputians as Mignonette, Anemonæflora, and Gloire de Bordeaux, with Madame G. Bruant, Mercedes, and Coupe d'Hébé, were noticeable. Messrs. Cranston were a close second.

Class 47, twelve Moss and Provence Roses.—These, arranged in bunches, were very beautiful. Mr. Prince was first with Banche Moreau, Cristata, Eugénie Guinoiseau, Old Moss, Centifolia, Lanei, Mousseline, White Bath, Madame Moreau, and Salet. Messrs. Paul and Son, Cheshunt, were second, and Mr. House, Peterborough, third.

Class 48, Buttonhole Roses.—These were also a delightful display. Mr. J. Mattock won with a charming stand of Comtesse de Nadaillac, Niphetos, Madame de Watteville, Souvenir de Paul Neyron, W. A. Richardson, Innocente Pirola, Marie Van Houtte, W. F. Bennett, Homère, Rubens, Ma Capucine, and Anna Ollivier. Messrs. Bunyard were second with a very beautiful lot, Messrs. Cooling third, and Mr. J. House fourth.

THE CHAMPION ROSES.

The Society's silver medal for the best Roses in the Show, individual blooms, were awarded as follows:—Best H.P., nurserymen's class, Ulrich Brunner, a magnificent flower, shown by Messrs. R. Mack & Son;

amateurs' classes, Marie Baumann, a superb bloom, shown by Mr. W. J. Grant. It was not quite clear on the stand whether the latter bloom was intended for the honour or one of its neighbours, and the official list omits mention of this, but not of the others; it is therefore named under reservation. The best Teas were both Comtesse de Nadaillac, the winner in the trade section being Mr. Prince, and in the amateurs' Mr. E. B. Lindsell.

SUTTON, SURREY.—JULY 2ND.

CONSIDERING the very trying weather for Roses which we have experienced during the past three weeks, it was a matter of surprise to all rosarians who visited this Show that so many excellent blooms were staged, and that so good a Show had been got together, more especially as some exhibitors were absent, evidently reserving themselves for the Show at Croydon held on the following day, where large prizes were offered and a challenge cup of considerable value was to be fought for; while many exhibitors who would doubtless have put in an appearance were prevented from doing so by the simple fact that their Roses were past and gone for the present, and 1889 will ever be remembered for the disappointments which so many have experienced. Another circumstance which militated against the quantity shown at Sutton by the growers for sale was the Rose Conference held at Chiswick on the same day. Considering, therefore, surrounding circumstances, and remembering that Sutton is an early place, there was, as I have said, a number of very beautiful Roses shown.

Taking the large class for growers for sale first, Mr. Frank Cant of Colchester exhibited both in the class for thirty-six and Teas some marvellously fine blooms, most exquisite in form and colouring, staged with great taste and judgment. His stand of thirty-six included the following flowers:—Her Majesty, a very fine bloom; Victor Hugo, Mdle. Marie Finger, Alfred Colomb, François Michéon, E. Y. Teas, Souvenir d'Elise, Pride of Waltham, very fine; Niphetos, a grand bloom, Star of Waltham, Countess of Pembroke, Madame Alphonse Lavallée, a very beautiful flower not often seen; Innocente Pirola, a grand bloom; Madame Lambard, L'Eclair, very bright and beautiful; Madame Victor Verdier, Jean Liabaud, Ulrich Brunner, Lady Mary Fitzwilliam, which has been very fine this season; Duke of Connaught, The Bride, very lovely; Sultan of Zanzibar, Comtesse de Nadaillac, lovely; Horace Vernet, Mdle. Marie Cointet, Madame de Watteville, Rosieriste Jacobs, a grand flower; Madame Cusin, Duke of Teck, Moiré, a fine bloom of a good old Tea; Prince Arthur, Francisca Kruger, A. K. Williams, Catherine Mermet, Earl of Dufferin, very fine; Miss Ethel Brownlow, a very beautiful Tea, approaching in colour Comtesse de Nadaillac, but distinct and good, and Harrison Weir. Mr. B. R. Cant was second with an excellent box, and Messrs. Burch third. In twelve Teas Mr. Frank Cant was again first with a most lovely box, consisting of Madame de Watteville, Innocente Pirola, Madame Cusin, a most marvellous bloom; Souvenir d'Elise, a Boule d'Or, Jean Ducher, Miss Ethel Brownlow, Francisca Kruger, Marie Van Houtte. This was a perfect stand of lovely flowers; Mr. B. R. Cant was second, and Messrs. Keynes, Williams & Co. third.

In the class for twenty-four distinct blooms (amateurs), Mr. E. B. Lindsell was first with a box of splendid flowers, consisting of Marie Rady, Charles Lefebvre, Gabriel Luizet, Xavier Olibo, La France, Duke of Connaught, Lady Mary Fitzwilliam, Horace Vernet, Duke of Wellington, Anna Ollivier, Beauty of Waltham, Captain Christy, Ulrich Brunner, Merveille de Lyon, Victor Hugo, Duchess of Vallambrosa, François Michéon, Thomas Mills, Abel Carrière, Marie Baumann, La Boule d'Or, Camille Bernardin, Caroline Kuster, and Lou's Van Houtte. Mr. J. G. Tinker was a good second, and Mr. F. M. Bethune third. In the class for twelve the Rev. F. R. Burnside of Much Birch Vicarage, Hereford, was first with, among others, good blooms of Merveille de Lyon, Ulrich Brunner, Madame Gabriel Luizet, Marguerite de St. Amand, A. K. Williams, Grace Darling, Catherine Mermet, Marie Van Houtte, and Comtesse de Nadaillac. Mr. F. C. Pawle of Reigate was second, the Rev. W. H. Jackson third. In the class for eight trebles Mr. E. B. Lindsell was again first with Merveille de Lyon, Marie Baumann, Niphetos, Marie Rady, Louis Van Houtte, Camille Bernardin, and Caroline Kuster. Mr. R. E. West was second, and Mr. F. C. Pawle third. In the class for twelve Teas Mr. E. B. Lindsell was again first with Innocente Pirola, Madame Cusin, a splendid bloom; Souvenir d'Elise, Comtesse de Nadaillac, Princess of Wales, Caroline Kuster, Etoile de Lyon, Madame Lambard, Princess Beatrice, and Catherine Mermet. The Rev. F. R. Burnside was second with Comtesse de Nadaillac, Innocente Pirola, Madame Cusin, Etoile de Lyon, Hon. Edith Gifford, Jules Finger, Madame de Watteville, The Bride, Jean Ducher, Francisca Kruger, La Princess Vera; the Rev. W. H. Jackson was third. In Class 5, for nine distinct, the Rev. Alan Cheales was first with Star of Waltham, Captain Christy, Alfred Colomb, Gabriel Luizet, Beauty of Waltham, Her Majesty, Dr. Andry, Jean Ducher, and Lady Mary Fitzwilliam; Mr. C. E. Cuthell was second, and Mr. Percy Burnand of Reigate third. In the class for six Mr. Percy Burnand was first with Her Majesty, Countess of Pembroke, Marie Baumann, Queen of Queens, a good bloom of a very meritorious flower; Mrs. John Laing, and Xavier Olibo; Mr. Ernest Wilkins was second, and the Rev. Alan Cheales third. In Class 7, for four trebles, the Rev. Alan Cheales was first with Pride of Waltham, Madame Gabriel Luizet, Marie Baumann, and Beauty of Waltham; Mr. C. E. Cuthell was second. In the class for six Teas and Noisettes the Rev. Alan Cheales was first with Maréchal Niel, Madame Willermoz, Madame Caroline Kuster, Catherine Mermet, Comtesse de Nadaillac, and Marie Van Houtte; Mr. C. E. Cuthell was second,

and Mr. Percy Burnand third. In Class 9, for six of any one, the Rev. F. R. Burnside was first with Madame Cusin; Mr. E. G. Fowler second, and Mr. Cuthell third. In the local class for six blooms Mr. F. Hughes was first—Marie Verdier, Ulrich Brunner, La France, Star of Waltham, Marie Finger, François Michelon, Captain Christy, and Camille Bernardin; Mr. Molle was second. In Class 12, for three dissimilar, Mr. F. Delane was first with Marie Finger, Camille Bernardin, and Captain Christy for three Teas; and J. Malcolm was first with Madame Lambard, Francisca Kruger, and Catherine Mermet; Mr. Heiron was second. Class for six of one sort, Mr. Malcolm was first with La France; Miss F. Hughes second. The ladies' challenge cup for six distinct was awarded to Mr. H. J. Malcomb for Marie Baumann, Lady M. Fitzwilliam, Baroness Rothschild, François Michelon, Gabriel Luizet, and Louis Van Houtte, all good; Mr. Miller was second.

As is usual at Sutton, there was a large display of decorations, and, as is usual there, considerable taste was shown in arranging them. Some of the tables were good, but in some the principle of cramming a lot of flowers without any artistic design was to be seen, which is not only contrary to good taste, but to the fashion of the present day. Some of the baskets of Roses with Maidenhair foliage were very beautiful. All these were shown in a separate room, and very tastefully displayed.

I need hardly say to any who know Sutton that the arrangements were excellent. An indefatigable Secretary like Mr. Ernest Wilkins, seconded by a thoroughly good working Committee, caused all to run smoothly, and my only regret was that being due at the Rose Conference I could not remain to greet many friends, and to enjoy, as I always do, a Show so admirably arranged and so well carried out.—D., Deal.

MAIDSTONE.—JULY 3RD.

A "NEW departure" was made by this old-established Society, by holding their Exhibition in a tent in the Palace grounds instead of in a room, having a band and keeping the room open until nine o'clock, and I believe that the result justified the step; but it is strange in a town where there used to be held at one time a large and successful exhibition of flowers that there is so much apathy amongst the inhabitants. Comparatively few of them visit the Show, and although the neighbourhood is a good one for growing Roses, with the exception of Colonel Pitt, who has taken up the position held for so many years by the recently lamented Mr. John Hollingworth, there is hardly a local exhibitor. The Club has a most earnest and indefatigable Secretary in Mr. Herbert Bensted, who concentrates in himself the duties that generally fall to a committee, and he knows the Rose as well as anyone with whom I am acquainted, and so manages to make all go smoothly and well, so that no excuse on that head can be made; yet withal, the Show is not supported as it ought to be. No wonder that he feels disheartened about it, and feels inclined to let the Society drop. This year the same reasons which have somewhat militated against other shows interfered with it. We missed many exhibitors whose Roses have been usually seen here. Other shows interfered. It was the second day of the Rose Conference, although, from what I saw on the first day, I hardly imagine that many were kept away by it. The earliness of the season again militated against it, for Maidstone is an early locality, and their Show was fully a week too late, while the Croydon Show, where large prizes were offered, doubtless kept more away than the Rose Conference did. Yet a very good Show was held, and some very fine blooms of Hybrid Perpetuals were shown, the Teas being a failure. When such growers as Mrs. F. Warde, who is changing her residence. Mr. Wakley, the Rev. H. B. Biron, and Mrs. Fuller were absent, it may readily be imagined that the quantity was deficient, although, as I have said, the quality was excellent. There were no prizes offered for nurserymen, so that none of those fine collections which we see at other shows were here, with the exception of some fine stands offered and set up by Messrs. Geo. Bunyard & Co. (not for competition), the largest number being stands for twenty-four. Of course it will be seen that this makes it more difficult to fill up a show.

In the class for twenty-four the first prize was awarded to Captain Knight of Bobbing, and the second to Colonel Pitt; the former six boxes contained good blooms of the following varieties:—Duke of Connaught, Captain Christy, Ulrich Brunner, Annie Wood, Marie Baumann, Duchess of Bedford, Innocente Pirola, Madame Gabriel Luizet, Pauline Talabot, Charles Lefebvre, Pierre Notting, Le Havre, Madame Cusin, Marie Rady, Etienne Levet, Emilie Hausburg, Star of Waltham, Bouquet d'Or, Marie Guillot, A. K. Williams, Catherine Mermet, Marquis de Sanima, and Général Jacqueminot. In the class for twelve Teas and two Hybrid Perpetuals for a cup given by the Mayor the prize was awarded to Captain Knight for good blooms of Eugène Fürst, Madame Willermoz, Emilie Hausburg, Innocente Pirola, Etienne Levet, Caroline Kuster, Captain Christy, Madame Lambard, Reynolds Hole, Marquis de Sanima, Penelope Mayo, Madame Cusin, Madame Gabriel Luizet, Hon. Edith Gifford, Olivier Delhomme, Alba Rosea, Hippolyte Jamain, Général Jacqueminot, Marie Van Houtte, and Souvenir d'Elise, a very pretty box with the Teas and Hybrids arranged alternately. In the class for eighteen, for members of the Club only, Mr. H. Foster of Ashford was first with a very beautiful lot of blooms, consisting of Baronne Hausmann, C. Ganneau, a flower unknown to me; Captain Christy, Marie Rady, Marquise de Castellane, Duke of Edinburgh, La France, Dr. Andry, Beauté de l'Europe, Red Dragon, Baroness Rothschild, Empress of India, Merveille de Lyon, Madame Cusin, Duchess of Bedford, Marie Verdier, Marguerite Brassac, Marie Baumann, and Madame Emilie Verdier.

In the class for eight varieties, trebles, Colonel Pitt was first with

Madame Victor Verdier, Gabriel Luizet, Prince Arthur, Madame Isaac Pereire, Emilie Hausburg, Villaret de Joyeuse, and Camille Bernardin. In the class for twelve Teas and Noisettes Mr. Killick was second—first not being awarded—with good blooms of Madame de Watteville, Anna Ollivier, Homère, Bougère, Marie Van Houtte, Bouquet d'Or, Marquis de Sanima, Souvenir de Mont Plaisir, Céline Forestier, Madame Trifle, and Marie Guillot. In the class for nine varieties Messrs. Ashurst and Tucker were first with Merveille de Lyon, Charles Darwin, A. K. Williams, Ulrich Brunner, Camille de Rohan, Alfred Colomb, Duchess of Bedford, Captain Christy, and Madame Gabriel Luizet. Captain Thornton was second, and W. Bryant, Esq., third. In the class for six of any one variety Messrs. Ashurst and Tucker were first with Captain Christy.

Some pretty stands of Roses and Ferns were exhibited, the first prize going to Miss E. Bensted, the second to Miss Day, and equal third to Mrs. H. Green and Miss Green. That exhibited by Mrs. Green, although too large for a table, was well suited for a large hall; there was boldness about it, and a good deal of artistic arrangement. For shoulder-knots the first prize was awarded to Miss E. Bryant, the second to Miss Day, and the third to Mrs. H. Green.—D., Deal.

CROYDON.—JULY 3RD.

In the Rose tent of the Croydon Horticultural Society's Show there was a slight falling off in the number of entries, but there were many fine boxes staged. In the nurserymen's classes for forty-eight blooms and twenty-four Roses, three trusses, Mr. F. Cant was first in both, and Mr. B. R. Cant second. Messrs. J. Cheal & Sons were first for twenty-four distinct Roses. For twelve Tea or Noisette Mr. F. Cant was first, and Mr. B. R. Cant for twelve blooms of one variety. In the amateurs' class the 25-guinea challenge cup was awarded to the Rev. J. H. Pemberton, Havering-atte-Bower, Essex, for an admirable collection of thirty-six varieties; Mr. Alfred Slaughter, Steyning, being second. His box contained the best Rose in the Show, Marie Verdier, for which the silver medal of the National Rose Society was awarded. The challenge cup for locally grown Roses was gained by the Rev. W. Wilks, Secretary of the Royal Horticultural Society, for six distinct varieties, and the National Rose Society's silver medal for the best bloom in the local classes was won by Mr. J. Brown, gardener to Mrs. Waterlow, Reigate. Mr. W. Blundell, gardener to G. Christy, Esq., Westerham; Mr. Percy Burnand, Reigate; Mr. E. M. Mawley, Berkhamstead; Mr. E. M. Bethune, Horsham; Mr. D. McDonald-Smith, Caterham; Mr. Councillor Dart, Croydon; and Mr. E. Wilkins, Sutton; were also among the prizewinners.

HITCHIN.—JULY 3RD.

THE ninth annual Exhibition, which was held on Wednesday last in the charming grounds of Hitchin Priory, proved a great success in all ways, and it must be a source of much gratification to the Rev. W. H. Gall, Hon. Sec., and his colleagues, to find how largely effective their labours have been in instilling the love of the Rose and Rose growing amongst all classes in the district; and although attempts have been made in the daily Press to undervalue these fascinating and humanising displays, no better answer could be furnished than the wide-spread contagion which the efforts of this Society has produced in a few years in the locality, growers, lovers, and exhibitors of the Rose having since the establishment of the Hitchin Rose Show more than quadrupled, and some of these have been enabled to battle successfully in open combat with the largest and best growers in the country. (NO 322)

In division A, class 1, open to all England, for forty-eight blooms, the highest honours were awarded to Messrs. G. & W. Burch, Nurseries, Peterborough; Messrs. G. Paul & Son, Cheshunt, being second, and Messrs. Burrell & Co., Cambridge, third. For twelve blooms in this division the same exhibitors were again marshalled in similar positions.

In division B, open to amateur members, for twenty-four blooms, Mr. E. B. Lindsell of Hitchin took the first position, as also for eight triplets, eighteen and twelve Teas and Noisettes, for six trusses of any H.P., and six of any Tea or Noisette, thus carrying off five of the principal prizes. For the twenty-four blooms Mr. J. G. Fowler, Woodford, came second; the Rev. W. H. Jackson, Stagsden Vicarage, running Mr. Lindsell neck and neck for the eight triplets was finally placed second. Mr. Jackson also received awards in four other classes; the Rev. Dr. King, Madingley Vicarage, Cambridge, taking second for eighteen and twelve Teas. For twelve blooms in division B—first, Mr. J. L. Curtis of Chatteris; second, Mr. Jackson; third, Mr. Kipling, Knebworth. In the local classes Mrs. Times, Hitchin, was first, and Mr. Gall second for twelve blooms. For six blooms Mrs. Lucas, Hitchin, was first, and Mr. W. Ransom second; Mr. Welch, gardener to J. H. Tuke, Esq., Hitchin, leading for six Teas, and Mr. Moules second. Mr. A. W. Lines, Hitchin, was first for six blooms, open only to non-winners previously.

For table decorations (Roses, Rose foliage, and Ferns only) Mrs. E. B. Lindsell was awarded first, Miss Grace Lucas taking a similar position for a hand bouquet and for buttonhole and spray.

The Rev. W. H. Gall afterwards hospitably entertained the Judges and his Rose-growing friends at The Sun Inn, at which Mr. J. L. Curtis proposed the health of the worthy host, which was kindly responded to by Mr. Gall, who proposed success to the Hitchin Rose Society, and suggested that as next year will be the close of the Society's first decade, renewed and doubled efforts should be made to render the next Exhibition an advance even on this, which has proved the most successful the Society has ever held.

BATH.—JULY 4TH.

A SPELL of remarkably hot weather brought on Roses generally very rapidly, and as far as the Bath fixture was concerned this might with advantage have been held fully a week earlier than usual. The blooms have opened quickly, and in many instances have proved very fleeting in character, nor do they long retain their freshness and form in the show tents this season; but luckily the Bath meeting was held on a comparatively cool day, and the numerous and very appreciative visitors were able to thoroughly enjoy the beautiful array of blooms brought together from all parts of the country. There was a slight falling off in the number of entries, but a greater per-centage of those who did enter really competed, and on the whole the exhibition fully attained to the well known high standard, and well sustained the good reputation that the Bath Rose Show has gained in former years.

In the premier class for seventy-two distinct varieties, single trusses, four noted firms competed, the first prize being well won by Messrs. Cranston & Co., Hereford, among their generally good lot being exceptionally fine blooms of Sir Rowland Hill, Victor Hugo, and Lady Alice Hill. Messrs. Harkness & Sons, Bedale, were second, and Messrs. G. Cooling & Sons, Bath, third, these exhibits being of nearly equal merit, while an extra prize was recommended for Messrs. Paul & Son, Cheshunt. Messrs. G. Cooling & Sons were well first with thirty-six triplets, distinct, among these being very fine blooms of Her Majesty, Pride of Waltham, Lady Mary Fitzwilliam, Abel Carrière, and La France. Messrs. Cranston & Co. were second, and Messrs. Paul & Son third. With eighteen triplets, distinct, Messrs. Keynes, Williams & Co., Salisbury, took the lead, staging a fine fresh collection, and in this class Messrs. Jeffries & Son, Cirencester, were second, and Messrs. Curtis, Sanford & Co., Torquay, third. Exactly similar positions were held by these exhibitors in the class for thirty-six single trusses, distinct, the exhibits being highly creditable in each instance.

Amateurs were well represented, but Mr. W. J. Grant, Hereford, had matters very much his own way, as he was first for thirty-six varieties distinct, eighteen triplets distinct, and twelve Teas or Noisettes, the other prizetakers in the same classes being Mr. R. N. G. Baker, Exeter, who had two seconds; Mr. S. P. Budd, Bath, and the Rev. F. R. Burnside. In other classes for amateurs, from which the foregoing exhibitors were excluded, the principal prizewinners were Messrs. A. Evans, W. Narroay, and T. Hobbs, while the most successful in the classes confined to local growers were Messrs. S. P. Budd, W. Morgan, Rev. G. E. Gardiner, Rev. C. C. Layard, Mrs. G. L. Hobbs, and Mr. Hill Gray.

There was good competition in the various open classes for a stand of one variety or colour, and these always prove highly interesting. For twelve trusses of any Rose Messrs. Paul & Son were first with Her Majesty in fine condition, and for twelve trusses of any yellow variety Mr. G. Prince, Oxford, was first with a lovely stand of Jean Dueher. With a like number of any crimson Rose Mr. W. J. Grant was well first, a similar award being made to Mr. Grant for a fine stand of La France. The best six blooms in three varieties of new Roses sent out in 1887 and 1888 were staged by Messrs. G. Cooling & Son, who had good fresh examples of Earl of Dufferin, Mrs. J. Lairg, and Madame Bois. Mr. J. Mattock, Oxford, were awarded a first prize for a charming basket of Roses, and Mr. G. Prince received a certificate of merit for his new Rose Souvenir de S. A. Prince. Messrs. G. Cooling & Son were well first for twelve bouquets of Roses, and Mr. J. Mattock second.

NORWICH.—JULY 4TH.

THE Norfolk and Norwich Horticultural Society, which has now been established for sixty years, held their annual Rose Show on the date named in the beautiful grounds of T. B. Coakes, Esq., of Thorpe Hamlet. This is a splendid situation for the purpose, being the highest point in Norwich, from which a lovely view is to be obtained of the surrounding country. The most successful Show in point of attendance that the Society has on its records was held in these grounds in 1882, and perhaps the most disastrous from the same point of view was last year, when heavy thunderstorms deluged the grounds in the afternoon. Many conjectures were made as to the probable nature of the Rose Show in this exceptional season, certainly the earliest in the eastern counties for the last ten years; but cool and cloudy weather prevailed during the morning of the Show, and for two or three days preceding, and this was undoubtedly favourable to the quality of the blooms exhibited, though it was plain that with amateurs the best of the first bloom of Teas was already over.

In the open class Messrs. Burch of Peterborough were first for forty-eight, with a fresh even stand, comprising few faulty and few exceptional blooms, Star of Waltham (which is good this year), Horace Vernet, and Her Majesty being among their best. Mr. Frank Cant of Colechester followed closely with a fine stand, among which Her Majesty, Duke of Teck, Madame Montet, Mrs. John Laing, and Lady Helen Stewart were conspicuous. Mr. B. R. Cant was third, having good specimens of Duke of Edinburgh and Germaine Callot; the latter as a new and little known Rose attracted considerable attention from its fine shape.

In twelve trebles Messrs. Burch were first with really good blooms; Mr. F. Cant, second; and Rev. A. Foster-Melliar, Sproughton Rectory, Ipswich, third.

In the amateur classes, Rev. A. Foster-Melliar was placed first for the Sheriff's prize for thirty-six, with large blooms, the best of which were Madame Eugénie Verdier, Fisher Holmes, Comtesse Nadaillac, Marie Raly, and Duke of Wellington. Rev. H. T. Frere, Burston

Rectory, Diss, was second with fine blooms of Marie Raly, Marie Baumann, and that uncertain H.P. Black Prince. T. H. Powell, Esq. (gardener, Mr. Palmer) was third with good flowers of Abel Carrière, Jean Soupert, and Duke of Edinburgh.

Rev. A. Foster-Melliar was again placed first for twenty-four, good blooms of Marie Baumann and Marie Raly being in his stand. Miss Penrice of Whitton (gardener, Mr. Morris) was second, and Rev. H. T. Frere third. For twelve Roses Rev. A. J. J. Roberts was first, cleanness, brilliancy, and neatness as usual distinguishing his stand. Rev. A. J. Fellowes, of Beighton, second; T. C. Bloomfield, Esq., third; and G. S. Culley, Esq., of Whitton, fourth. For twelve local the last named gentleman was first, Mr. R. Cross second, and Mr. Learner third. For six Mr. Culley was again first, Mr. W. Birkbeck second, and Mr. Cubitt of Honing Hall third.

There was a good competition in the class for twelve Teas, which resulted in a popular win for Rev. H. T. Frere, Marie Van Houtte and Etoile de Lyon being his best blooms. Mr. Roberts second with Nadaillac good though not large, and La Boule d'Or in good form. Mr. Foster-Melliar was third with a very richly coloured Jean Dueher and a fine Innocente Pirola among his blooms.

Twelve of one sort of H.P.'s almost invariably produces stands of Madame Gabriel Luizet, this variety's habit of blooming all at once making it useful for this purpose. Mr. Page Roberts obtained second with this Rose, but Miss Penrice beat him with A. K. Williams, and Mr. Powell was third with Baroness Rothschild.

For twelve Teas of a sort Rev. A. Foster-Melliar won somewhat easily with Comtesse Nadaillac, many of them being good blooms, Mr. Powell being second with Caroline Kuster, and Miss Penrice third with a poor box of Homère.

For a class provided by Mr. F. Cant for twelve Roses, including not less than four Teas, Mr. Page Roberts showed another beautiful twelve, a bloom of Maurice Bernardin being very conspicuous in it; Rev. A. L. Fellowes second, Miss Penrice third.

The silver medal for best H.P. was awarded to Miss Penrice for a medium-sized, not perfectly shaped, but very clean bloom of La France, and Comtesse Nadaillac deservedly gained the corresponding honour for Teas for Mr. Page Roberts. The former decision did not meet with unanimous approval.

It was a capital Rose Show, and would have been better if Committees and Secretaries would think of exhibitors in selecting their days. There were actually two other Shows in Suffolk, at Eye and Woodbridge, on the same day; and more than one of the successful exhibitors was endeavouring at great inconvenience to hold the field by an assistant at another Show, whilst coming himself to Norwich to do battle in person. These remarks contain no reflection on the Norwich managers, who in choice of day were first in the field.

It was very pleasant to find that an increasing interest, which is likely to promote the true instincts of gardening in every way, is being taken in hardy perennials. A new and formidable competitor appeared in the principal class for twenty-four bunches in the person of Rev. F. Page Roberts, in whose first prize stand were noteworthy specimens of Scabiosa caucasica, Heuchera sanguinea, Epipactis gigantea, Orchis foliosa, and Delphinium Madame E. Geny. Mr. Corder of Norwich was second with specially interesting bunches of Lilium longiflorum Harrisii, Morina persica, Astrantia carniolica, and Lilium pardalinum. Dr. Beverley of Brundle, Norwich, was third with an interesting stand, many of which, however, were rather flowering shrubs than hardy perennials. The exhibits of pot plants, fruit, and vegetables call for no special comment beyond admiration of the Ferns, British and exotic, exhibited by Mr. H. Trevor. These plants are both perennials and perpetuals, and would be missed, like old faces, if absent from Norwich.

The Norwich Horticultural Society is in a most sound financial condition. It is thoroughly well supported in the city and county, and as the officers work together harmoniously its future appears likely to be even more prosperous than its past.—W. R. RAILLEM.

CANTERBURY.—JULY 4TH.

THE venue of this Society was again changed this year, and the Show was again in the Foresters' Hall instead of as last year in the Deanery Garden, and the day being very bright and fine, a good deal of regret was expressed that the change had taken place. There is always more pleasure on a fine day in an out-of-doors show than in one held in a room, even when the light is good, and the light in the Foresters' Hall is not good. The Corn Exchange, where the Show was first held, is, I think, one of the best rooms for a show that I have ever seen, and that at Winchester about the worst.

There is a good deal of spirit in Rose-growing about Canterbury, and unlike Maidstone, local growers come well forward, although the general public is sadly lacking in sympathy with the Society. In excuse for them it may be said that the exterior is not inviting or attractive, nor the interior, with the exception of the flowers, very exhilarating; but notwithstanding all this there was a very excellent and enjoyable Show, which was rendered especially interesting by collections of cut blooms of hardy herbaceous plants, exhibited by Mr. Clarke of the Maison Dieu Nursery, Dover, and Mr. George Mount of the Exotic Nursery, Canterbury. Owing to the Bath Show being held on this day, at which most of the leading nurserymen exhibited, they were not here to-day, and the competition in the nurserymen's class was confined to Kentish nurserymen, Mr. Geo. Mount taking the leading position, and Mr. Thomas Bunyard of Ashford taking second place with Her Majesty, a grand bloom, showing that when it can be caught it is a grand Rose, but its

uncertainty is well shown by a box of six set up by the same exhibitor (not for competition), in which the flowers were all coarse and rough, Louis Van Houtte, Etienne Levet, Mdle. Eugénie Verdier, Duchesse de Morny, Eugène Fürst, Captain Christy, Ulrich Brunner, Marie Baumann, Merveille de Lyon, Alfred Colomb, Abel Carrière, Thomas Mills, Charles Lefebvre, Auguste Neumann, Elie Morel, Star of Waltham, Duke of Teck, Baroness Rothschild, Madame Victor Verdier, Camille Bernardin, La France, Countess of Rosebery, Duke of Edinburgh, Marie Rady, Fisher Holmes, Duchesse de Caylus, Duchess of Bedford, Prince Camille de Rohan, Prince Arthur, Madame Gabriel Luizet, Xavier Olibo, Dr. Andry, M. Krell, Beauty of Waltham, and Charles Darwin. Mr. Bunyard was third. In the class for twelve Teas and Noisettes Mr. Geo. Mount was the only competitor, and had nice blooms of the following:—Madame de Watteville, Souvenir de Paul Neyron, The Bride, Catherine Mermet, Hon. Edith Gifford, Innocente Pirola, Maréchal Niel, Souvenir de Thérèse Levet, Rubens, Marie Van Houtte, Niphetos, and Madame Caroline Kuster.

Coming now to the classes for amateurs, in the class for twenty-four Mr. R. E. West was first with Captain Christy, Madame Susanne Rodocanachi (notwithstanding her name a very pretty and staying Rose; Mr. West spoke highly of its durability), La France, Comtesse d'Oxford, Alfred Colomb, Marquise de Castellane, Baroness Rothschild, François Michelin, Auguste Rigotard (a fine bloom), Duchess of Valambrosa, Pierre Notting (very good), Annie Wood, Eugène Fürst, A. K. Williams, Marie Verdier, Louis Van Houtte, Madame Gabriel Luizet, Duke of Edinburgh, Senateur Vaisse, Merveille de Lyon, Abel Carrière, and a beautiful bloom of Sir Rowland Hill, of a most lovely colour, fully justifying all that has been said in its praise; in habit, form of flower, foliage, and wood it is exactly like Charles Lefebvre, but the colour is entirely different, being of a beautiful deep claret red. Capt. Knight of Bobbing was second, and Mr. H. Foster of Ashford third. In the class for eighteen Mr. H. Foster was first with Captain Christy, Marie Baumann, Merveille de Lyon, Marquise de Castellane, Magna Charta, Annie Wood, La France, Duchess of Bedford, Empress of India, Baroness de Rothschild, Madame Emile Verdier, Comtesse de Serenye, Général Jacqueminot, Camille de Rohan, Ipswich Gem, and La Fortune. Capt. Knight was second with a box of unnamed flowers. In the class for twelve Teas Capt. Knight was first with Madame Hippolyte Jamain, Madame Willermoz, Marie Van Houtte, Madame Lambard, Souvenir de Paul Neyron, Prince of Wales, Madame Bray, and Comtesse de Sarnia. In Class 5 (local), for twelve varieties, Mr. S. Cooper, Stonley, was first with Dupuy Jamain, Madame Margottin, La France, Baroness Rothschild, Duke of Edinburgh, Marquise de Castellane, Innocente Pirola, and Alfred Colomb. Mr. Stanly second, and Miss E. M. Holdsworth third. In the class for nine Teas Captain Lambert was first with excellent blooms of Madame Lambard, Comtesse de Nadaillac, Grace Darling, Souvenir d'un Ami, Jules Finger, Innocente Pirola, Alba Rosea, Souvenir de Thérèse Levet, and Souvenir de Gabriel Drevel. Mr. Cooper Walker was second, and Miss Hawkworth third. In the class for twelve trebles Miss Hawkworth was first with Baroness Rothschild, Marie Van Houtte, Duke of Edinburgh, and Anna Ollivier. In Class 8, for nine varieties, Captain Martin of Chilham was first with Captain Christy, Abel Carrière, Marie Baumann, Mabel Morrison, Marie Finger, Baroness Rothschild, Duke of Edinburgh, and Violette Bouyer.

In Class 9, for six varieties, Mr. G. Collard of Canterbury with Gabriel Luizet, Baroness Rothschild, Her Majesty, Beauty of Waltham, Fisher Holmes, and La Rosière. Captain Martin was second with Alfred Colomb, Fisher Holmes, Comtesse de Nadaillac, Prince Arthur, Marie Rady. Mr. Rolt was third. In Class 10, for six Teas, Captain Martin was first with Comtesse de Nadaillac, Souvenir de Thérèse Levet, Madame de Watteville, Hon. Edith Gifford, Madame Cusin, and Niphetos. In Class 11 Mr. Elgar with excellent blooms of Baroness Rothschild, Bouquet d'Or, Captain Christy, Eugène Fürst, Louis Van Houtte.

There were some excellent epergnes of Roses and foliage. The first prize was awarded to Mrs. Walker, the second to Mrs. Mount, and the third to Miss Welby. For buttonholes Mrs. Mount was first, Mrs. Rolt second, and Miss Agnes Dean third.

One very pleasant feature of the Show, a large number of herbaceous plants exhibited by Mr. Clarke, and some pretty vases of hardy flowers by Mrs. Mount.—D., *Deal*.

ONCIDIUM LANCEANUM.

THIS can be well grown in a pot or pan, but it succeeds better on a good-sized block or in a basket. During the season of growth it will grow luxuriantly in the East Indian house, at the warm end of the Cattleya house, or suspended from the roof of a house of mixed stove plants. When an attempt is made to confine the roots of this plant in a pot or pan they require the most careful treatment during

the winter to preserve them in good condition; in fact, we have found them perish during the season of growth if overwatered. When grown in pots or pans material that rots quickly should not be used. Three parts of the pot or pan must be filled with charcoal in lumps and large pieces of crock, for the roots cling freely to these, the remaining portion being filled with good peat used in lumps, or, better still, peat fibre, with a little living sphagnum moss on the surface and the sides of the basket, so that it can be removed every season. However good the treatment in pots may be this plant prefers blocks or baskets, so that a considerable portion of its roots can be exposed in the atmosphere. On a good-sized block with a little peat or moss for retaining moisture, or in a basket, it can be kept in perfect health for years. If very little peat or moss is used in the baskets or on the blocks it is almost impossible to give too much water during the season of growth. This can be supplied by syringing liberally twice daily and steeping them thoroughly occasionally. No harm appears to result by removing the plant when in flower to cooler, drier, and more airy conditions. The flowers under this treatment last considerably longer than in a close warm house.

PLEIONES.

These will do during their season of growth at the warmest end of the Cattleya house; in fact, they are not very particular about the position they occupy as long as sufficient heat and moisture is maintained to encourage free growth. From this season of the year they succeed well under the treatment that has been advised for *Calanthes*. They require a good season of growth, and every attention should be paid to the development of their pseudo-bulbs. Liberal supplies of water should be given, and occasionally weak stimulants, when they are rooting freely. Liquid made from cow manure freely diluted with water given in a clear state will assist them considerably.—ORCHID GROWER.

ODONTOGLOSSUM CRISPUM.

I SEND you a few spikes of *Odonoglossums*. I think they will speak for themselves as to their merit, or I shall leave you to do that in your valuable paper. We have at present about 300 spikes of blooms arranged in two houses; they must be seen to realise the effect. Standhall is one of the highest points in Lancashire, and I find that this Orchid does wonderfully well under my treatment. We have three houses of equal size, north aspect, well stocked with *Odonoglossums* of the best varieties that can be secured. The houses are well ventilated at the top and bottom, and I avoid artificial heat as much as possible. In fact, one of our best *Odonoglossum* houses was without artificial heat the whole of last winter. Plenty of pure water and ventilation I believe to be the secret of success in the cultivation of this beautiful Orchid.—ROBERT JOHNSON, *Gardener to Thomas Stutter Esq., Standhall, Whitefield*.

[Splendid spikes and fine varieties, the flowers large, and in several cases boldly and heavily spotted.]

KEEPING LATE GRAPES.

WHILE sending off the last of my late-kept Grapes (new ones are also in use) I enclose a few for your inspection, to show that they can be kept fresh and of good quality till new Grapes are plentiful in the markets. It is alleged by some that Grapes kept in bottles of water lose greater weight than on the Vines. When the sap rises in the Vines the fruit must be removed, and it may not be a difficult matter with market men; but in private gardens, where all the glass has to be in use during winter as storage and for plant protection, the advantage of getting the Grapes cleared out is very considerable, and in a few hours some hundreds of bunches can be placed in the bottles; the cost of labour afterwards does not amount to more than a few shillings. The loss with us is nominal, and reduction of weight nil. Seldom are new Grapes equal in flavour to those which I enclose, and the expense of forcing during winter instead of summer is very much greater. Our Grapes are placed in cupboards formed for the purpose along the walls of the garden office, and are kept dark; air can be admitted if desired. A boy gives the little attention necessary, and I think that it would be difficult to persuade me to return to the old system in vogue when I was a boy. When we had to supply Grapes all the year round by means of pots to ripen fruit in April the results were comparatively a burlesque.—M. TEMPLE, N.B.

[The Grapes received are in excellent condition, the stalks green and the flavour superior to that of any new Grapes we have tasted this year.]

BEGONIA CORALLINA.

THERE are many varieties of *Begonias* which make handsome specimen plants if treated liberally, but amongst them few that can compare with *B. corallina*, represented in the accompanying illustration (fig. 4). Its origin seems to be rather doubtful, but it is generally

considered to be only a variety of *Begonia maculata*, which it most resembles in appearance. Being of easy culture, and very free flowering, this plant is a great acquisition for the conservatory. It is best

individual flowers are not large, but cluster together in such large racemes as to make it a really charming plant. It would form a good companion for *B. fuchsioides* for training up the pillars, but the long

FIG. 4.—*BEGONIA CORALLINA*.

suited for planting out, as it grows to a large size under ordinary greenhouse treatment, and a specimen 8 or 10 feet high, with its dark green glossy leaves almost covered with bright coral-red flowers hanging down in large panicles a foot or more in length, is most effective. The

cane-like shoots should not be tied too tightly or they will not have such a graceful appearance. When kept in pots *B. corallina* flowers freely enough, but does not grow so well, and consequently it is not nearly so handsome.

EVENTS OF THE WEEK.—Highgate Flower Show will be held to-day (Thursday). The following are Rose Show fixtures for the current week:—To-day (Thursday), Gloucester; Friday, July 12th, the Alexandra Palace; the 13th, Eltham and New Brighton; the 16th, Birkenhead and Carlton-in-Lindrick; the 17th, Bedford and Ripley (Derby); the 18th, Sheffield (National Rose Society) and Helensburgh.

— **THE WEATHER.**—A welcome change has occurred in the weather during the past few days in the neighbourhood of London, the sky having been more or less overclouded and occasional showers fallen, but by no means heavy rains.

— **CRYSTAL PALACE ROSE SHOW.**—His Imperial Majesty, the Shah, and their Royal Highnesses the Prince and Princess of Wales, visited the Show at 6.30 P.M., the National Rose Society being represented on this occasion by Mr. Edward Mawley, one of the Society's Hon. Secretaries.

— **A CENTURY OF MEDALS.**—The medal awarded to Messrs. Carter & Co. for their group of Emperor Petunias and ornamental Grasses at the evening fête at the Royal Botanic Gardens makes the one-hundredth medal gained by the firm for their seeds and plants grown from them—a record they believe to be unbeaten.

— **MESSRS. RANSOMES, SIMS, & JEFFERIES** desire to state that Her Majesty was pleased to accept one of their lawn mowers at the Windsor Show, and to purchase another, as also did the Princess Victoria of Prussia.

— **MESSRS. SUTTON & SONS** of Reading have received the following letter:—"Sir Henry Ponsonby is commanded by the Queen to thank Messrs. Sutton for the floral decorations and miniature garden surrounding the Pavilion, which they have had the kindness to present to Her Majesty."

— **THE ALEXANDRA PALACE SHOW.**—At this Show, which is to be held on Friday, the 12th inst., the interesting ceremony of crowning the Rose Queen will be conducted by the Rev. Father Nugee. Mr. R. Beale, the manager of the Show, also intends holding a bazaar for the sale of horticultural literature and surplus Roses given by exhibitors, the proceeds of the sale to be given to the Gardeners' Orphan Fund.

— **DR. LIVINGSTONE STRAWBERRY.**—The sample sent is from the third picking, and therefore not the largest fruit. It is hardy and a robust grower, very prolific, suitable for any soil, and gives heavy crops under trees where other varieties fail; a second early, its latest fruits swelling to a good size.—WM. THOMSON, *Blantyre*. [The fruits received were large enough for any purpose, but so shaken and crushed in transit that their quality cannot be tested.]

— **LONG BROAD BEANS.**—Mr. Heard of Machen House, near Newport, Mon., sends three specimens of Broad Beans grown by his head gardener, Mr. McKinnon. Two of the pods are 13½ inches long and one 13 inches, and Mr. Heard wishes to know whether we have seen any so long? We think they are the largest that have been sent to us, and we have not measured long specimens we have seen on exhibition tables. Perhaps some of our readers have, and can send the dimensions if they exceed those named.

— **THE CHERTSEY STRAWBERRY GARDENS.**—The *Surrey Advertiser* says:—"Chelsea may boast of its Orchids, and Bagshot of its Rhododendrons, but it remains for Chertsey to excel in Strawberry culture. The celebrated Royal Strawberry Gardens at Knowle Hill, cultivated by Mr. Thomas Sharpe, embrace an area of over 7 acres, from which more than a ton of luscious berries are being picked per day. About 1300 lbs. are daily packed in flat baskets and despatched to various parts of the country, and twelve pickers and packers are busily engaged at this work from 4.30 A.M. to 8.30 P.M. At the present time the gardens present an extraordinarily beautiful appearance, the ground being literally red with fruit. They are well worthy of a visit, and an additional attraction is that visitors for a slight fee are permitted to gather and eat the fruit from certain beds at their own sweet will."

— **THE GARDENERS' ORPHAN FUND.**—Mr. George Deal, the excellent Chairman of this charity, desires us to remind our readers that the anniversary dinner and election of children will take place at the Cannon Street Hotel, London, on Friday, the 19th inst., and he hopes all gardeners who can do so, with others who are in sympathy with the object, will make arrangements for attending on the occasion. So do we. The proceedings will be of a most enjoyable character, and a large gathering of horticulturists is expected. Tickets, 5s. each, can be obtained from Mr. A. F. Barron and members of the Committee. In answer to an inquiry we may add that visitors are not expected to attend in evening dress, this being entirely optional.

— **THE RAINFALL AT CUCKFIELD, MID-SUSSEX,** for June was 0.23 inch, being 1.73 inch under the average, rain falling on only three days. Highest temperature, 96° on 7th; lowest temperature, 45° on 17th and 18th. Mean day temperature, 80°; mean night temperature, 51.1. Mean temperature, 65.5°, being 5.2° above the average of the past seven years.—R. INGLIS.

— **UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.**—The quarterly meeting of the above Society took place at the Caledonian Hotel, Robert Street, Adelphi Terrace, Strand, on Monday evening, July 8th, Mr. E. Berry in the chair. The Committee are sorry to report the death of one of the members (Mr. A. Barker of Hindlip), who died on June 14th last. A cheque was drawn for the widow for £8 7s. 4½d., the amount standing in the ledger to the credit of the late Mr. Barker. Four new members were elected, and the usual business transacted. A cordial vote of thanks to the Chairman ended the meeting.

— **FAREHAM SHOW.**—We have received a report of this Show, but cannot find space for it for reasons which are apparent. Captain Ramsey obligingly opened his gardens to the public, and his fine display of Roses was greatly enjoyed. He won the chief prize for Roses at the Exhibition "with finely formed and extremely fresh blooms." Mr. H. F. Hawkins, gardener to G. Bishop, Esq., Swanwick, and Mr. W. May, gardener to W. H. Deane, Esq., Fareham, were the most successful exhibitors of plants. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rookesbury Park, was awarded the chief prizes for black and white Grapes, Strawberries, and a collection of vegetables. The Revs. E. S. Pridcaux and T. G. Browne were successful in the vegetable classes, and Mr. E. Penfold, gardener to Sir F. Fitzwigram, Bart., Leigh Park, Havant, sent well grown plants not for competition. The Show was well managed by Mr. Harry Smith.

— **THERE** are some noteworthy CONIFERS AND OTHER TREES in the grounds at Brockhurst, East Grinstead. The owner, Mr. K. R. Murchison, is a great tree-lover, and has embellished his estate with an extensive collection of exotic and native trees, many of which have been planted under his personal supervision. The grounds are extremely irregular, and the wise course has been pursued of planting and furnishing in accordance with the configuration of the place as Nature had provided it. The house is somewhat low, and almost immediately in front of it rises a huge mound, perhaps 100 feet above the ground level, with other banks and slopes undulating, as it were, from it. On and between these Conifers and Rhododendrons have been freely and judiciously planted, and the grounds consequently present a highly picturesque appearance. The trees are a magnificent feature. There is a *Pinus insignis* approaching 70 feet in height, a truly noble specimen, which was planted from a flower pot by an old man still working on the estate, but the veteran's memory is hazy as to the exact date. *Araucaria imbricata* is best represented by a very shapely specimen about 30 feet high. *Picea nobilis* with its beautiful silvery foliage is extremely handsome, and there is a fine tree that was planted by Mr. Murchison himself. Of *Wellingtonia gigantea* there is a handsome pair, about 50 feet high and 11 to 12 feet in circumference at the base. *Picea Nordmanniana*, a fine pyramid of *Pinus austriaca*, and a good example of *Cedrus deodara* were admired. There is also a finely furnished Cedar of Lebanon, and of Oak, Beech, and other forest trees some noble examples. The Golden Yew presents a highly effective appearance with a bright sun shining on its yellow leafage, and a handsome small-leaved shrub, named *Podocarpus andinus*, is graceful.

— **THE WEATHER AND CONIFERS.**—The wet weather of last season and the warmth of the present one have had most beneficial results so far as Conifers are concerned, as those at Brockhurst are making splendid growth, and all on the estate, numbering some hundreds, are in admirable condition; but the Oaks have suffered terribly from the

maggots, in fact the leaves are almost cut to pieces. The marauders are green and brown grubs, nearly 2 inches in length, and where Roses were growing in the immediate vicinity of the Oaks they, too, have been attacked with great severity.

— RHODODENDRONS are a great feature of Brockhurst. They have been planted with a liberal yet careful hand, and large clumps of them occupying prominent positions are a blaze of beauty in their season. They are most effective on the side of the lake, which can be seen from the residence. Here there are huge masses of the best and choicest hybrids, their glowing trusses making a rich display, and in some places overhanging the water. In May and June the Brockhurst Rhododendrons are a sight that cannot be excelled in the county, and perhaps nowhere else in the kingdom are they more advantageously grouped. Many visitors call to inspect them, and none fails to admire the gorgeous effect produced by the large and fine collection of these noble flowers.

— STRAWBERRIES are abundant in the neighbourhood of East Grimstead, also Gooseberries, Plums, and Currants. Raspberries are moderate in quantity. Apples and Pears practically a failure. Of the first named, President and Vicomtesse Héricart de Thury are bearing enormous crops. A bushel and a half had been gathered just before I inspected the beds at Brockhurst, and they were still loaded with fruit. Mr. Simmons (the gardener there) has great faith in mulchings of stable manure. He practises the simple plan of putting out forced plants, trims them in autumn, mulches with good short manure, leaving it till spring, and when the plants are coming into bloom mulches with manure just as it is received from the stable, allowing it to remain all the year, so that its virtues may be washed in by the rains. As he is able to point to good crops annually there is not much fault to be found with his plain practice.—P.

— CROYDON HORTICULTURAL SOCIETY.—At the annual Show of this Society, held in the grounds of Wellesley House, the President of the Society, Philip Crowley, Esq., Waddon House (Mr. W. King, gardener), was awarded the premier prize for nine stove and greenhouse plants in flower, and also in the corresponding class for foliage plants. In the former were remarkably well bloomed *Ixora Pilgrimi* and *I. Williamsi*, *Erica Cavendishiana*, *Miltonia vexillaria rosea* with twenty-one spikes, and a well-grown *Cypripedium Lawrencianum*, having over a score of blooms. Mr. T. N. Penfold, gardener to the Rev. Canon Bridges, Beddington, was second in both classes. He was also awarded the silver medal offered for the best grown exhibit in the Show, with a remarkably well-grown *Asplenium*. Mr. H. Elsley, gardener to Capt. Wright; Messrs. C. Stew, gardener to E. Perrit, Esq.; C. Simmonds, gardener to F. W. Wiltshire, Esq.; J. Rodbourn, gardener to Baroness Heath; and W. Jupp, gardener to Cuthbert Johnson, Esq., were successful in carrying off the chief prizes offered in the local classes. Groups were a great feature in the open class, Messrs. W. King, T. Butcher, and J. R. Box being awarded the prizes in the order named. In the local class Mr. C. Stew secured the first prize, his notable plants being *Gloxinias* of a similar strain. Messrs. J. Laing & Sons, J. Peed & Sons, J. R. Box, J. Cheal & Sons, G. Bunyard & Co., T. Butcher, J. Cooper, and Pascall and Sons (Pottery) supported the Show with exhibits not in competition.

— A ROSE FAIR.—In connection with the above Show the Committee obligingly provided a tent for holding a Rose Fair, the proceeds of the sale of blooms to be devoted to the Gardeners' Orphan Fund. Two Croydon ladies, Mrs. Dart and Mrs. Gunner, kindly presided, and between £12 and £13 were realised.

A. F. BARRON STRAWBERRY.

You tell me I was silent when I sent you the A. F. Barron Strawberry the other day. True, but I had a reason, which was simply to wait until I could speak accurately of this new comer. I have grown it for three years in three positions—due south, due north, and in the open quarters, and my reason for waiting was to test it when grown on a north border. I had a small local committee and no mean judges, each one of whom looked upon it as a sterling novelty, and I agree with their verdict. I take no note of it not doing well at Girtford or Chiswick, because at Girtford Sir Joseph Paxton refuses to grow, and at Chiswick farmyard manure is scarce.

A. F. Barron Strawberry is a good grower, a prolific bearer, and particularly hardy, whilst the fruit is well shaped and has a very fine sparkling flavour; for appearance, which is a great consideration in the market, it stands alone. I have grown Strawberries now for forty years, and can truthfully say that A. F. Barron gives me pleasure that my pen cannot describe. I shall grow it largely.

Touching Noble, it is the very best early Strawberry of my knowledge, and I feel sure if ever a man deserved a testimonial for raising so many good things, that man is surely Thomas Laxton, if it was for only raising Noble Strawberry.—R. GILBERT, *Burghley Gardens, Stamford*.

ALTHOUGH this Strawberry does not make vigorous growth on the hot sandy land of Girtford, it succeeds there better than either of its parents, Sir Joseph Paxton or Sir Charles Napier, neither of which I have ever been able to keep healthy in that garden. At Bedford, on somewhat stronger but not over-enriched soil, A. F. Barron grows and does well, and as its fine flavour, handsome appearance, and fertility are strong recommendations, it will, I believe, be a most desirable sort to grow on ordinary or well-cultivated Strawberry land. As a late forcer, too, A. F. Barron has proved an acquisition.—T. LAXTON, *Bedford*.

FLORAL EXHIBITS.

At the summer exhibitions of metropolitan and provincial horticultural societies the growing importance of the cut flower and floral decoration department is becoming every year more apparent. These exhibits constitute the chief attractions of many shows, and the increasing interest on the part of the public is manifested by the crowds of visitors which gather in the tents devoted to such classes lingering to inspect closely, and not unfrequently to criticise. Flowers are now more extensively employed in home decoration than at any previous period, and though we scarcely rival our American cousins in elaborate and general work of this kind there has been a considerable advance in recent years. The Covent Garden Flower Market during the spring and early summer months affords an excellent idea of the demand existing for cut flowers in London. Most of the large provincial towns have their markets equally well supplied, while enormous quantities are distributed by the smaller florists direct from the growers, and through the street vendors, who also obtain their supplies from the producers themselves.

The greater portion of these flowers are of course sold in small quantities and utilised in adorning a few simple glasses or vases, but during the London season most extensive orders have occasionally been received, especially when the decorations of some mansion have to be carried out in one kind of flower, or at least in two or three shades of colour of the same kind. Then the florists' resources are often severely taxed. At one time perhaps some thousands of La France Rose may be required, at another yellow or scarlet Carnations are wanted in equal numbers. There is now much more general appreciation of decoration in as few tints as possible, the brilliant but usually discordant mixtures of numerous colours having rightly fallen into disfavour. At one establishment the rooms are on special occasions adorned individually with flowers of one colour, but the respective tints are carefully selected for adjoining rooms, so that there is a gradual transition from one to the other. With a view to carrying out this scheme in Roses a visit was paid by the gardener to the Chiswick Conference last week and a selection of varieties made in their different groups of colours to be utilised at some future time in a display of Roses that might be expected to be of a most charming character.

Though many societies devote an important part of their schedules to the floral exhibits, yet very few have ever attempted to provide an exhibition solely devoted to them, and the Royal Botanic Society's Evening Fête at Regent's Park has for some years been the only special floral Show of this character in the metropolis. Liberal prizes tempt numerous competitors, who indicate the diversity of their tastes in the varied characters of their contributions, and the responsibility rests with the judges of showing by their awards which are most in accordance with good taste, thus instructing both exhibitors and visitors. At Regent's Park, however, the erratic nature of the awards has for some time been familiar to those who attend the Fêtes, and on the last occasion (Wednesday, July 3rd) this was even more remarkable than previously. In competitions of floral decorations, it is true that originality of design is comparatively seldom displayed, and there is a tendency to sameness that it is very desirable should be avoided and corrected as far as possible by the adjudicators. But originality is not always accompanied by good taste, and it is easier to break away from a conventional style than it is to produce anything better.

The classes for tables with and without fruit invariably constitute an important feature, and this was so on the occasion under notice, as not less than fourteen were shown, but the majority of these were in the first class for tables 10 feet by 5 feet, decorated with flowers without fruit. The Judges had some ten tables to select from, and bestowed first honours upon Mr. W. L. Buster of St. Mary's Cray for a good arrangement, but somewhat too heavy and dull in colour. Three stands were employed in which *Humea elegans* with Grasses were freely employed at the top, with drooping sprays of *Lygodium scandens*. The flowers of the *Humea* are of

a rather dull tint, especially under artificial light, and the odour is too powerful for some even in a conservatory, while in a warm room it would be more noticeable. The base of the stands comprised Water Lilies, Pelargoniums, Gloxinias, Gladiolus Colvilli, with Caladiums, Panicums, and Fern fronds. The two side stands were rather smaller, but similar, a number of small glasses filled chiefly with Grasses and wild flowers being placed about the table. The second award was made to Miss M. Weedon, Notting Hill, which must be reluctantly characterised as a most inelegant exhibit. It consisted of a huge pile of wild flowers and Grasses arranged in elliptical form 3 feet high, and as much in length. Various umbelliferous plants were liberally employed with faded Poppies and small Campanulas. Four corner glasses and a few small dishes were similarly filled. We failed to detect a single merit in this arrangement; certainly it would have been impossible for persons sitting opposite to see or hold converse with each other at the table. The third prize table from Messrs. E. W. Handley, Stoke Newington, was scarcely less objectionable, but for another reason. A heavy central trumpet-shaped glass vase was employed, 4 or 5 feet high, loaded with Marguerites, Stephanotis, Grasses, and Coreopsis, with drooping sprays of Asparagus plumosus round the tube, and a base of Gladiolus Colvilli, Francoas, Lilies, and Ferns. To see the top of the stand when sitting at the table would have necessitated considerable neck-straining of a disagreeable kind.

It might be thought that a difficulty in finding anything of a more elegant character compelled the adjudicators to award the prizes as they did, but in the opinion of many visitors by far the best in the competition was that from Mrs. Chard, Stoke Newington, for which no prize was adjudged. Unquestionably for lightness and gracefulness it was much superior to the others, and because the style is one that has been frequently seen before in decorations from the same exhibitor should not be allowed to tell against it. Three light glass epergnes, with three small branches each, were employed, the tops being filled with white Clarkias, Rhodanthes, Aquilegia chrysantha, Gloriosas, a few Dendrobium flowers, and Marguerites. At the base were white Lilies, Asparagus plumosus, a few Cattleyas and Irises, long narrow single leaves of Crotons and Ferns. Sufficient colour was employed to render the stands effective without being too bright, and the arrangement was very skilfully managed. Several other designs were notable, one consisting of large dishes of Roses, another of Moss Roses only, a third of white Lilies and Roses in the centre, with six smaller stands of La France Roses and Gladiolus Colvilli; still another comprised flat stands of Coreopsis, Gladiolus Colvilli alba, and Grasses, while one exhibitor relied upon Bougainvilleas and dark Roses in low stands.

The tables of similar size, but dressed for dessert, were not so numerous or so varied, the premier exhibit being from Messrs. F. & C. Osler, Oxford Street. In this large low lamps were employed, with pale cream-coloured shades, a large centre bowl being filled with yellow Sweet Sultans and yellow Dahlias, Liliun auratum, Crotons, and Ferns—altogether a very heavy production. Messrs. Graham & Biddle, of Oxford Street, were placed second for a peculiar but very original arrangement. In the centre of the table was a broad oblong strip of gold satin, upon which was formed a low mound of White Gladiolus Colvilli, yellow Calceolarias, Eryngium flower heads with white and yellow Marguerites and Adiantum fronds. Amongst these were several small plain glass electric lamps, the bright gleams from which would be rather objectionable so near the diners' eyes. The third honour was taken by Mr. J. Chard for a tasteful example in his well known style. Three stands were filled with Rhodanthes, Gloriosas, Pancratiums, Aquilegias, Oncidiums, a few Cattleyas and Gladioli, Peaches, Nectarines, Strawberries, and Grapes being the fruit employed. This was preferred by many of those present to both the preceding tables.

In the bouquet classes exhibits of an unusual character were favoured, though frequently presenting defects of a serious character. Messrs. Edwards of Balham were the most successful with bridal and ballroom bouquets, the first being a heavy mass of white Roses and Stephanotis, the other a huge loose bunch of pink and yellow Roses, with Honeysuckle and dark foliage. Mrs. H. M. Ballingall of Camden Road was second with a tasteful bridal bouquet, composed of Stephanotis, Roses, Gladiolus, Pancratiums, and Adiantums; Mr. G. Gordon following with white Roses and Carnations. The second ball bouquets were from Mr. Youens of Leigham Court, Streatham, who has repeatedly given good examples of his taste and skill, though his bouquet of yellow Centaureas and white Gladiolus was not the best we have seen from his hands; but the charming dress spray, shoulder knot, and fan adorned with white Roses and Woodruff was an admirable exhibit, and well merited something more than the bronze medal awarded.

The decorations for racemes, hanging baskets, window boxes, and other exhibits added to the interest of the display, but do not call for special notice, except that the bright yellow Coreopsis was liberally employed in a number of cases.

At the Twickenham Show, held last week, a pretty feature was introduced in the floral department by instituting a class for "six small table decorations in glass or china vases, not exceeding 6 inches in height and 4 inches in width." All those shown were tasteful and pleasing, the first, from Miss Griffiths of Yelverton Lodge, being single glasses of Gladiolus Colvilli and alba, yellow Marguerites, Brizas, light Grasses, and Adiantums. Mrs. Keston's second prize contribution were neat little glass tripods lightly filled with Iceland Poppies (white, yellow, and orange), yellow Sultans, Marguerites, and a few dark Tropæolums and Grasses. These were graceful and pretty, but wanted a few Fern fronds to complete them. Scarcely less tasteful were the tripods from Miss G. Gardiner; three filled with yellow and red Aquilegias, the other with white Clarkias and blue Cornflowers, the former having much the better effect.

The Iceland Poppies are charming flowers for vases, but as a rule they are shown only with a few Grasses, and have a rather bare appearance. An instance of this occurred at the Richmond Show, where floral exhibits were extremely well represented, a handsome stand insufficiently furnished with foliage losing many points on that account. Blue Cornflowers are seldom seen to advantage in stands of mixed flowers, and under artificial light they are very unsatisfactory, yet many continue employing them at shows. Few blue flowers can be used with good effect, and the tint must be very pure and bright to fit them for such purposes.—L. CASTLE.

ABOUT HARDY FRUITS.

SINCE 1875, when I took up the occupation of my father, who for forty years had followed the calling of market gardener, I have been a close observer of the surroundings of fruit-growing. Being very desirous to secure some improved varieties I determined on first growing a collection, and then reducing the varieties as I found desirable. The result is, I am now reducing my stock to Lord Suffield and Ecklinville Seedling of kitchen Apples; Cox's Orange Pippin and a variety I got for Lady Derby of dessert, Marie Louise d'Uccle of Pears, and the Victoria Plum. All Apples of the Keswick tribe I find are desirable for the north, and with these I include Potts' Seedling, which, however, this year is a failure, the wood being of too gross a nature for last year's miserable summer to mature. This also may be said of all the dessert varieties, there being little more than a sprinkling of fruit on any of them. Fortunately with us Lord Suffield has not cankered, and this year, as is usual, it has decidedly the best crop. As I expected, many I see will fall, but I am already convinced the Lord Suffield will mature its fruit buds for the following season with less sun than any other variety that I have, and as to the fruit it is quite safe to say it will ripen with less sun than with the fruit buds. The Marie Louise d'Uccle Pear is, undoubtedly, a long way down the scale if we consider only quality, but it is possible even as to quality. For a wall in the north of England it is a certain crop, for the open ground quite as good a cropper as the Hensle; the bloom is certainly more hardy, and it has the very desirable characteristic of having the foliage well developed before the bloom opens.

As to the causes of this year's partial failure I find, as is generally the case, there is again a difference of opinion. That there should be such a diversity of thought when the cause of failure is so palpable I consider most regrettable; in fact, more so than in the loss of the crop. Experience undoubtedly makes us wiser—not wise I am afraid; but with the ablest how much easier is it found to pick up than to lay down; or, in other words, to learn than to unlearn. During the winter months, when we had the first of these hard winters, 39° of frost here, I examined to find how the fruit trees were affected, when to my dismay I discovered that the heart of the short stem that connects the bud to the branch was black and as dead as a stone. I at once sent a few to our Editors for their opinion, when, as I expected, and as will still be found recorded, the opinion was given that the Apple and Pear crop of that season would be a failure. But as usual when failure occurs after the blooming there came a discussion, when to my surprise the 39° of frost was exonerated from blame. So it has been again with many. They saw the blossom and looked no further, as though the life so snugly enfolded was of no import. It would be quite as consistent were we to decide that the top coat was the portion of importance and the man within its folds of no consideration. The blossom never fails in its duties, neither does the pent up sap ever fail in expanding to give the first start; so it is the inexperienced, or, too frequently the unthinking, rush into print on the great promise of abundance. My decided opinion is that had the present season been the least ungenial, such was the condition of the vital parts of the embryo fruit here in the north, that we should have had complete barrenness, and I quite as decidedly hold that had we had a week's more sun last season, to have coupled with the present season, this would have been the greatest fruit year that the oldest would have remembered.

I was going to give a few of the more conspicuous peculiarities of

varieties, but my already scribbled sheets remind that I must reserve for a future opportunity. But just a sentence more which I would like to offer as a text for the young and thoughtful portion of your readers to ponder over. With links of the same family by which the universe is held together we have seasons too coupled, and the more we recognise this truth the reader shall we comprehend and be able to perform the duties our calling is surrounded by; in fact, it is the greatest of misfortunes our failing to zealously recognise this potent factor, which we see included in the great and wondrous machinery all in order contributing to our well-being.—JOSEPH WITHERSPOON, *Red Rose Vineries, Chester-le-Street.*

CHRYSANTHEMUM SHOW FIXTURES.

WHY Mr. Hughes should ask me to explain the changing of the dates he refers to of the Hull Chrysanthemum Society I am at a loss to understand, as the alteration of a detail so important is a matter which devolves on the Committee. If he refers to my note (page 444) he will hardly find that I blame the Society to which he belongs for the elating of the dates, but I there say it is regrettable that such a clash should take place, as it undoubtedly will. Exhibitions of any sort, let alone giants like these, ought not under any conditions to be placed in antagonism, although I know well how difficult it is to steer clear of the dates of each other, but the necessity need hardly have arisen for these two societies to have their shows on the same day. Mr. Hughes says I "particularly complain of the unsuitableness of the date of the Birmingham Show for southern growers." I have not yet seen any reason for altering my opinion, and does he know of one other grower in the south who will say it is a suitable date? I should not need to mention this part again, but Mr. Hughes says the object of these handsome prizes was to bring about a contest between growers of the north and south. He cannot have any experience of a southern grower's difficulties in exhibiting a week earlier than that named for the Birmingham Show, much less so late as the 20th November, or he would not say the date is an intermediate one.

The National Chrysanthemum Society hold their great Show on the 12th November this year. Last year it was on the 7th. If the executive did not consider these dates best suited for their Show why did they fix them? The results justified the aim, as anyone could say who saw the exhibition of last year. Now if they were to select dates twelve days later than these I wonder what sort of a show they would get? These are facts which speak for themselves as to the most suitable time for southern exhibitors. The dates are evidently fixed by persons who have experience of southern Chrysanthemum growing.—E. MOLYNEUX.

ROYAL HORTICULTURAL SOCIETY.

JULY 9TH.

THE Fruit and Floral Committees held their first meeting of the year in the gardens at Chiswick, and as the Chiswick Horticultural Society's Show was held on the same day, quite an extensive and varied display was provided, three large marquees, besides a good portion of the conservatory, being devoted to exhibits. The day was warm and fine, and the gardens were looking in their best condition.

FRUIT COMMITTEE.—Present: T. Francis Rivers, Esq., in the chair, with W. Wildsmith, W. Bates, W. Denning, J. Smith, G. Wythes, W. Warner, Philip Crowley, and J. Wright.

Mr. J. S. Clark, Richmond Park, Staines, sent growing plants of Potatoes in pots, also from tubers in moss, the leaves being distinctly and clearly variegated with white. It is a novelty that growers of curiosities may perhaps like to try (a vote of thanks was accorded). Nine dishes of splendid Strawberries were sent from Mr. W. Allan, Gunton Park, Norwich (a cultural commendation was unanimously awarded). Amongst them the large dark variety, Waterloo, was conspicuous, and though its colour may not be admired by all, there are purchasers willing to pay higher prices for this than any other Strawberry. Mr. Lovel, Driffield, sent remarkable fruiting trusses of Filbert Pine, also a good dish of fruit (a vote of thanks was accorded). Mr. Barron placed on the table fruits of a seedling Strawberry, the result of a cross between *Fragaria lucida* and the Hautbois. It has long been grown in the gardens, and though small is of remarkably rich flavour; a Strawberry that should be increased and grown by connoisseurs.

Mr. J. H. Goodacre sent from Elvaston Gardens a stem of a Melon plant bearing four fine looking well netted fruits weighing 4 lbs. each, and as the quality was good a first class certificate was unanimously awarded. Three of the fruits were produced on a length of stem of less than a foot. It has somewhat the appearance of the old Golden Perfection, and evidently possesses a combination of good qualities. It is named The Countess.

Mr. Charles Turner sent from Slough a dish of a yellow form of the Perfection Tomato, appropriately called Golden Perfection. The fruits were smooth and handsome, and it was recommended that the variety be grown in the gardens for fully testing its merits.

Mr. T. F. Rivers placed on the table dishes of three varieties of Cherries—namely, Early Rivers, large, early, and rich, a variety of undoubted excellence; Bigarreau Ludwig, pale, early, and excellent; and a variety named Olivet, somewhat resembling the Kentish, but three weeks earlier; it bears abundantly on Gooseberry-sized bushes, hence is suitable for small gardens.

Messrs. James Veitch & Sons submitted examples of the Gros Parasseuse Cabbage Lettuce, large, firm, crisp, and altogether meritorious, and a first-class certificate was granted unanimously.

Mr. George sent samples of improved wood wool for packing, softer, sweeter, and whiter than before, being from the Poplar; it is excellent for the purpose suggested.

The Committee inspected several varieties of Raspberries growing in the gardens, and without a dissentient voice accorded a first class certificate for Hornet (Rivers) for its healthy growth and fine trusses of large firm fruit. It has been long grown in quantity at Sawbridgworth, and there regarded as the best Raspberry in the collection.

The Peas growing in the trial ground were also inspected. Some varieties grown under numbers only were passed in consequence. A first class certificate was adjudged for Consummate (Eckford), a dwarf growing variety, 2 to 3 feet high, laden with large dark green pods, and Laxton's Optimum only lost a similar honour by one vote.

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair; and Messrs. W. Goldring, Shirley Hibberd, J. Walker, H. Herbst, C. Noble, H. Turner, L. Castle, B. Wynne, J. O'Brien, J. Dominy, J. Douglas, J. Fraser, W. Holmes, and Dr. M. T. Masters.

Messrs. J. Veitch & Sons, Chelsea, exhibited a pretty yellow *Genista capitata*, the small flowered *Hypericum Coris*, with small plants of ornamental Conifers, and the rosy mauve *Notospartium Carnichaelia*. Messrs. Paul & Son, Waltham Cross, had a box of new Roses Marchioness of Lorne and Salamander, both Hybrid Perpetuals and erimson in colour, were notable. Mr. T. S. Ware had a group of hardy flowers, chiefly Lilies and Pentstemons, a first class certificate being awarded for *L. pardalinum* var. *luteum*, yellow with deep maroon spots. A pure white Carnation, Mrs. Frank White, was adjudged an award of merit. Mr. A. R. Brown, Birmingham, contributed a group of *Calceolarias* of many varieties, but small flowers. Mr. Mortimer, Farnham, had a group of a new miniature *Capsicum* in 48-size pots, the plants bearing large numbers of small red fruits (first class certificate). From the Royal Horticultural Society's Chiswick Garden came a collection of annuals with several Ivy-leaf Zonal Pelargoniums. Mr. Gordon, Twickenham, exhibited a collection of Irises. Mr. C. Turner, Slough, sent a box of Carnation flowers; Messrs. Hooper & Co. and Mr. Douglas also having Carnation flowers. Mr. J. Walker, Thame, contributed several boxes of Sweet Williams, representing an excellent strain.

In the afternoon the Floral Committee also held a meeting in the Chiswick Gardens to examine the collection of annuals grown there for comparison, chiefly with a view to determining which are the best adapted for town gardens.

ORCHID COMMITTEE.—Present: Dr. M. T. Masters in the chair, and Messrs. T. Baines, J. Douglas, L. Castle, J. Dominy, H. J. Veitch, and J. O'Brien.

Mr. T. Charlesworth sent a plant of a good variety of *Cattleya gigas*, with richly coloured flowers, but it was not considered superior to others of the better forms of that species. Six panicles of a fine variety of *Oncidium crispum*, named *grandiflorum*, with the flowers over 3 inches in diameter, deep brown, with a yellow centre to the base of the lip were shown. A cultural commendation was recommended for it, but lost, and a first-class certificate was awarded by four votes to two against. Mr. Whillans, gardener to the Duke of Marlborough, sent a plant of a light variety of *Cattleya Mendeli*, named *Duchess of Marlborough*, the sepals and petals white or faintly tinged with blush, the lip yellow in the centre—a delicate and charming variety, which was unanimously awarded a first-class certificate. A plant of *Physosiphon Loddigesii* was shown by Mr. Tautz of Hammersmith, and a botanical certificate was unanimously awarded for it. It has slender spikes of small flowers, with a swollen greenish tube and orange brown sepals.

THE CHISWICK SHOW.—In some departments the competition was not quite so numerous as on previous occasions, but the Show was a good one, fruit, flowers, plants, groups, and vegetables being well represented.

The chief attraction was in the marquee devoted to groups, where Mr. W. Brown of Richmond succeeded in again winning the first prize in the competition for the challenge vase offered by Mrs. Lec. This now becomes Mr. Brown's property, and he well deserves his success, for he has won first honours three times with excellent examples of good taste in arranging plants. It was very light and tasteful, *Lilium lancifolium* and *auratum* with a few *Crotons*, *Odontoglossums*, and *Gloxinias* being employed with excellent effect on a bed of *Caladiums*, *Adiantums*, and small Palms. Messrs. W. Fromow & Sons, Chiswick, were second with a rather heavier group, rich in colour, handsome, but somewhat crowded. E. H. Watts, Esq., Devonhurst, Chiswick (gardener, Mr. A. Wright), was first in a class for smaller groups with an elegant and well-balanced arrangement.

A long tent was filled with decorations, cut flowers, and cottagers' productions. For three stands of flowers and foliage the Duke of Devonshire offered several prizes, the first of which was secured by Mr. J. R. Chard, Stoke Newington, with very light graceful arrangements.

consisting of yellow Aquilegias, Coreopsis coronata, yellow Sweet Sultans, and a few Cattleyas at the base. Mr. Chadwick, Ealing, was second with light stands. Mr. Chard was also first with three bouquets; Mr. W. Gardiner, 127, Queen's Road, was second, and Mr. J. A. Morris, Acton, third. Mr. W. E. Tautz, Sutton Lodge, Chiswick, was first with six elegant buttonholes, and Mr. J. C. Cowley second.

Mr. H. Little, Twickenham, was accorded first honours for Orchids in both classes for six and three, Mr. Cowley following in each case. Messrs. J. Veitch & Sons, Chelsea, had a handsome collection of Shirley Poppies, Irises, Phloxes, and other hardy flowers. Gloxinias were good from Messrs. A. Wright and Davis, who secured the chief prizes. Tuberous Begonias from Messrs. Little, Wright, and Hardy were another feature of the Show. Mr. W. Rumsey had the only collection of twenty-four Roses, taking the first prize for fresh and handsome blooms. Mr. W. Langdon was first for twelve Roses, followed by Mrs. Rust of Kew and Mr. C. J. Waite.

The fruit and vegetable exhibits occupied considerable space in the conservatory, several classes of specimen plants also having a place there. For six dishes of fruit Mr. Bates was first with white and black Grapes, Stirling Castle Peaches, Lord Napier Nectarines, Sutton's Hero of Lockinge Melon, and a neat Queen Pine. Mr. T. Osman, Ottershaw Park Gardens, was second, and Mr. Waite third with Grapes. The chief honours for vegetables were secured by Messrs. Waite, Coombs, Palmer, and Chadwick.

STRAWBERRY CULTURE.

A SHORT time ago we received a pleasant letter, from which the following is an extract:—"Have you any contributor who can send you a draft copy of a contribution sent to the *Cottage Gardener* so long ago as 1851? I have had the curiosity to con over it, and if you examine it I am not certain it may not be considered worth printing again for the perusal of the present generation." The writer of the letter and of the yellow-with-age MSS. is Mr. Robert Fenn of Potato fame, and we shall be very much surprised indeed if any other person can send us the original copy of an article that was published in the *Cottage Gardener* nearly thirty-eight years ago, and if he can, and it is as good and pleasantly written as the one following, we will print it again. The "present generation" of young gardeners will perhaps note that Mr. Fenn when he was young "wrote over again," and no doubt improving as he went along, what he intended for the press, retaining the draft, and that practice no doubt enabled him, as we know it has enabled others, to write freely and agreeably. That he succeeded in his early effort is apparent by the editorial note that was appended when the article first appeared under the once familiar *nom de plume* of "Upwards and Onwards." Mr. Fenn characteristically observes he "struck seventy-one last February, and is still pegging away at horticulture and agriculture." Many older than he, we are glad to know, are still engaged in gardening, and we trust he has yet some years of pleasurable work before him.

If anything new or useful can be derived from my practice in Strawberry culture, as I here detail it, the presumption of my mite as a contribution to your ever-welcome-to-me, and generally, I should conceive, useful periodical, will, I hope, be atoned for, notwithstanding the great deal of matter already known which it may contain. The site I choose for my Strawberry ground is that on which either my early Peas, Potatoes, or Cauliflowers are grown. These come off in July, and allow me two months to well trench, manure, and pulverise the soil. I invariably in trenching (2 feet deep for Strawberries) keep the bottom spit down, and if I can get it I use a barrowload of manure to each square yard of ground, mixing it equally through the whole body of the soil. I allow the soil to lay as rough as possible after the first trenching for a month. I then trench it again, but this time add no manure, leaving the surface as I proceed quite rough, in order that the sun and air may act upon it as much as possible. It will settle down nicely by the middle of September, at which time on the first favourable rain, but not till then, I place out the young plants for good.

I keep a few plants of each kind of Strawberry I cultivate in a distinct part of the garden. These I term my breeders, from which every runner that appears is carefully pegged down the moment it shows a leaf, and so on till such time as the required quantity is provided. Those which appear after this on the mother plants I cut off without mercy, and they accompany the refuse to the dung-pit, as well as every fresh runner that attempts to show itself from those previously pegged down. I have now (July 12th) an abundance of healthy runners rooting. They will be ready to prick out in about ten days, and I intend them to occupy a site now taken up with a row of Bishop's dwarf Peas, which will be off the ground by that time.

As soon as these Peas have done bearing the ground will be well forked, a tolerable sprinkling of rotted manure added, and the young plants pricked out thereon 9 inches apart. I take them up carefully from the ground on which they are pegged down with a garden trowel, allowing as much soil as will cling to them to do so, though in this operation I like to cut off the points of the young roots in moderation, as this induces them to send out fresh roots nearer home. After they are pricked out (in which operation I am careful not to bury the crowns), I keep them well watered until they have taken good root. I do not let them produce a single runner, and of course all weeds are eradicated from them as they appear. I keep the ground repeatedly scarified. This brings us, we will say, to the middle of September,

when, on the first wet day, even if a thorough drizzling should be the result, I plant out the Strawberries.

The varieties of Strawberry I cultivate are Keens' Seedling, the British Queen, and Elton. I allow them to bear two years, and then invariably dig them down, at least this was my practice when I lived in the vicinity of Ludlow. I was not acquainted with the British Queen until I came here (Woodstock), and I find after three years' familiarity with this sort and on this soil (a gravelly loam), I must propagate new plants yearly, as I find the two-year plants are apt to die away just before they arrive at their blooming state; and so far as my knowledge of them goes I cannot prevent them doing so, nor can I find out any assignable cause for their decay. The yearling plants with which I filled up the rows last year are healthy. Therefore it cannot be supposed that the severity of winter has in this particular case anything to do with it. With the latter and former kinds I shall pursue my old two-year system of cultivation. My distances of planting out are—for Keens' Seedling, 1 foot 6 inches between the rows, and the same distance between the plants; British Queen and Elton, 2 feet between rows, and 1 foot 6 inches between the plants. I allow an alley extra of one foot between every two rows of plants.

At planting-out time I take up the young plants from the ground on which they are pricked out, with tolerable balls of soil adhering to the roots. In this point I am very particular, and of a necessity the roots in taking up the plants become circumscribed a little by the action of the trowel or small spade (the latter instrument I generally use at this stage of the process); this mild mutilation still causes an increase of roots nearer the plants, and more useful members of them.

I prick out my runners as near the planting ground as possible, in order that I may step a few paces, and deliver the plant directly off the small spade into the hole prepared for it. I need not explain the why and wherefore of this proceeding. I am particular in not burying the crowns of the plants and in not mutilating a single leaf if I can possibly help it. Attend to watering the plants a short time if necessary, eradicate all weeds, and keep the ground, but mind only the surface, stirred about them. Do not take a leaf off them until next March, and not then even unless the leaf is withered.

The beginning of next March. Many a cold dreary day will have to be borne before that day arrives, many a store of knowledge laid up in those long winter evenings, and many a bushel of soot saved from the winter sweeping of our chimneys for our Strawberry grounds in the beginning of March. Soot mixed with an old Cucumber bed is a top-dressing I always prepare for my Strawberries. I mix it at the rate of a peek of soot to every wheelbarrow load of the said Cucumber bed, and the manner I apply it is as follows:—I shovel or cause to be shovelled off about 1½ inch of surface soil flanking the first row of plants. This is wheeled and laid in a parallel line with the last row. Then comes the mixture of soot and manure, which is spread 2 inches thick on the surface from whence the soil was removed. Now step between the next two rows of plants, shovel the soil off over in a similar manner, spreading it evenly over the 2 inches of manure, which it will slightly cover and prevent the escape of the nutritious gases of the manure, prevent its becoming dried by the sun and winds, and withal make a tidy appearance. Follow up this proceeding until the whole is finished, and the first soil that was removed will cover the last layer of manure. The rains will wash down the nurture of the manure just as the plants are coming into full life and activity, ready to take advantage of these good things.

So far so good till the blooming period, at which time, if it should prove dry, I give the plants a thorough soaking with soapsuds and water, about half and half and warm, once a week. Our laundress for years has been in the habit of throwing her soapsuds away. I begged of her to allow it to be brought to me once a week, which she kindly acceded to. As Beau Brummel formerly said of starch, so I sing in praise of soapsuds. "It is the man," or, as we must say, "It is the Strawberry." It has an astonishing effect on fruit and vegetables if given just as they are coming into production, and against blight I think my trees can testify it is equally good. My odd man, when I first began to send him for it, I fancy thought me a little crazy, but now he tells me that the suds which his old woman makes he applies to his own garden. As the Strawberries come into bloom they will struggle to reproduce their kind in the shape of runners. These I treat as utter abominations. I go over, or cause to be gone over, weekly every plant with a pair of sheep shears, and clip off every runner in its infancy.

Now in what manner can we protect the fruit from becoming spoilt in its ripening process? It is a fact, I have tried tiles, straw, slates, short-mown grass, and have left the fruit to take its chance, and I like neither way. The tiles harbour the slugs beneath them, preclude the air and light from the soil, and all become damp and stagnant about them. Slates are no better, but in addition soon become burning hot, or are in the extreme of cold. Straw encourages the mice, which not only nibble the Wheat which remains in it, but nibble off numbers of the berries also. Short grass in a wet time becomes mouldy, and sticks to the berries as badly as dirt, and leaving the fruit to be dashed and splashed on the ground by every pelting storm, I find the most disconsolate proceeding of all. Some good people go to the enormous expense of building a garden wall, plant choice trees, and then in the nick of time, and just as they would if they could come into bearing, they allow the poor things to take their chance, and get no return for their money or even the satisfaction of their garden looking decent.

This is really allowing the "feelings to go before the understanding." Certainly if a man sets himself to think, it matters not if the object be small or great so long as he does think, and thinks to the purpose.

Where I formerly resided in Salop there was a great quantity of the shrub Snowberry. The roots of these Snowberries had run along and intersected the shrubbery in all directions, throwing up suckers, and forming, in some places, an almost impenetrable jungle; and the bright idea came into my head one fine day that this stuff might be made useful in some way as to protecting my Strawberries. I thought at first of spreading it entirely over the surface of the ground, but concluded that would be too gawky. A few hours after I was looking at some yellow Sallows, and the idea came upon me in a moment. The Snowberries certainly would make nice little faggots, and long ones, too, bound round with some of these very Sallow twigs.

It was winter time. I set to work next day, and did not cease this employment till 200 of these little faggots were completed. They were each 5 feet long, 6 inches in diameter, rather flat than round, and tied rather loosely with the yellow Sallow twigs mentioned above. The small side-spray, of which there was a profusion, was allowed to remain rather loosely about them. I placed them in a dry loft till the proper period of using them.

I placed these alongside my Strawberries about the time they were coming into bloom. I fastened each faggot down in its place with a hooked peg sufficiently long to steady it; for expedition, neatness of look, protecting the fruit from wireworms, slugs, and dirt. Let the rain, however severe it might be, pour upon them, it could not injure them; they were either suspended in the air, or reclining on the sides of the faggots, and in ten minutes after the severest storm were perfectly dry, with scarcely a splash of dirt upon them. The rows of red berries exposed to view irregularly along the side-spray of the faggots have a rich and very pretty appearance. The plan perfectly satisfied me, and I intend to improve upon it another year. The faggots were taken up after the bearing season was over, and placed in the dry, and would probably, and have, for all that I know to the contrary, lasted till this time. We came to this place the following spring before the Strawberries came into bloom, and we found not a plant in this garden to faggot. I had a fine flowery description given to me of this garden before I saw it; but, alas! what a "baseless fabric of a vision"—how supremely bamboozled was I. I found it a dreadfully worn-out affair, and almost as far off what it was represented to be as it is to its antipodes. However, upon the principle that when a man's cart sticks in the mud, it is very little use calling on Jupiter for assistance unless he puts his own shoulder to the wheel, I set myself to work. The following winter found this garden very much resembling a gravel pit.

I had the good fortune to meet with one of the best working labourers in this country, and he came to me with the understanding that he was to do as I wished, and not to argue on a matter, whether he thought it right or wrong (the man that I employ occasionally now comes upon the same principle, and it saves me an immense amount of time and argument). Suffice it to say, the following spring found this garden under quite a new arrangement, with Strawberries again in perspective. I have explained how I placed the small faggots along each side of the plants there; but as each of my plants are 1 foot 6 inches apart, there are interstices between each, which also require a something similar to the sides. I find, in order to report progress "faithfully," I must here make another digression. I have no Snowberry undergrowth here to make faggots; and, in fact, being in a town, as we are, I have not got any wood at all but by purchasing.

Hereon hinges a tale of wants. I wanted small spray for making my faggots; I wanted dwarf Pea sticks; I wanted charcoal for potting purposes; I wanted wood ashes when sowing my seeds; I wanted stout sticks for different gardening purposes; I wanted slender stakes and sticks for my flowers; I wanted stakes with forks, and pegs with hooks; I wanted something, and after all this picking and choosing, to burn the large and small wood remaining over and above economically, and our household wanted home-baked bread. Now comes the explanation. This house had been in existence, according to the chronicles, this two hundred years, and most likely, for that period of time, its inhabitants have felt themselves dissatisfied with eating baker's bread—I know I did—and I did not see why, even if the house had existed so long without an oven, that it should do so any longer. The Strawberries were at the bottom of all this. If wood was bought to heat the oven, the small faggots and all the other et-ceteras would follow in the wake. A useless copper boiler was instantly turned out of the kitchen, and a nice little oven built on its site, at a very little expense, a convenience that we could not possibly dispense with; and yet see how the thing originated—merely because I found myself in a fix as to the Strawberries. These are all mere trifles, yet in the aggregate they make a sum of human happiness. The small faggots I make here from the wood we buy are chiefly composed of Hazel. They are 4 feet long, 6 inches in diameter, and instead of Sallow twigs I use tar-cord for bands. In the interstices between the plants I place loose sticks cut about 1 foot in length, and in sufficient quantity to keep the fruit well from the ground; the faggots I place exactly as heretofore.

Now the last, and not the least, enemy are the birds. I defy them also. Their numbers are legion. My Strawberries are so planted, that the old mended fishing-nets I buy exactly cover two rows. Up the centre of these two rows I drive some stakes (about 1 inch diameter, 2 feet 6 inches long) into the ground, allowing their tops to remain above the leaves about 6 inches. I place them from 10 to 15 feet apart. Along the top of these stakes, which have a short natural fork on their

tops, I strain a line of tar-cord—the forks at the top of the stakes being merely for the convenience of so doing. The net is now placed along the top of this, and strained down to the small faggots at the sides, which effectually secures it, and keeps it down in a kind of way that I defy any bird to gain admittance; and, in consequence of the net being suspended along the tar-cord above the plants, the foliage remains in its natural position, allowing the sun and air to penetrate and circulate in every direction without let or hindrance.

In gathering the fruit it is merely necessary first to release the net on one side of the two rows entirely; let it remain suspended on the top of the tar-cord, and gather the fruit off that row; then fasten down that portion of the net, and proceed on the other side in a similar manner. In unfastening the net from the faggots, the utility of pegging them down will be at once perceived.

The after-management of the plants that are to remain till another year claim my attention unceasingly. I keep them free from all runners and weeds, and the surface soil amongst them well scarified, but never on any account more than inch in depth. As to cutting off a healthy leaf, fancy cutting off a little piece of one's own lungs! would it be possible to enjoy the full vigour of a constitution after that?—UPWARDS AND ONWARDS.

[We hope to hear from this correspondent very often; he is "a fellow of infinite humour," but a good gardener withal.—ED. C. G., July 12th, 1851.]

CABBAGE LETTUCE NEW YORK.

I HAD some seeds sent for trial this spring, and amongst them was a small packet of a Cabbage Lettuce named New York, which I have no hesitation in saying is a real acquisition, and when better known it will become a general favourite with growers and consumers. It is the largest Cabbage Lettuce I have seen. It is a quick grower, hearts well, comes into use very soon, and stands for a long time in good condition. The quality is excellent; it is white, sweet, and crisp, and stands the heat and drought without running to seed better than any Lettuce I know. Paris White Cos and All the Year Round Cabbage Lettuce were sown with it on the same border on the 14th of March, and are now bolting rapidly, while New York is as firm and crisp as could be desired, and not the least signs of it running to seed. I consider it the best Cabbage Lettuce in cultivation.—A. PETTIGREW, *Castle Gardens, Cardiff*.

HORTICULTURAL SHOWS.

RICHMOND, SURREY.

THE Richmond Horticultural Society's fifteenth annual Show was held as usual in the Old Deer Park, Richmond, and amply realised the favourable expectations announced a short time before. It was, in fact, one of the best the Society has had both in extent and quality of the exhibits generally, while it is doubtful if the display of Roses and floral decorations have ever been equalled at Richmond. The Roses in particular were very numerous, and it was said that as many were shown as at the last three or four exhibitions together. Four spacious marquees were devoted to the exhibits, the largest being 240 feet long by 60 feet wide, and this was occupied with the specimen plants and groups, the last named constituting one of the special features of the Show. The other marquees were filled with Roses, miscellaneous cut flowers, vases, &c.; the fruit, vegetables, and cottagers' productions also having a tent to themselves. The competition throughout was very keen, and not one of the 103 classes was unrepresented, nearly the whole of the prize money was appropriated, and in some cases there were eight and twelve entries in each class. The weather proved exceptionally fine, a remarkable contrast to that experienced at last year's Show, and the result was the receipts at the gates were nearly doubled. The courteous Hon. Secretary, Mr. J. H. Ford, his energetic assistant, Mr. Gribble, and the Committee must be congratulated upon the well-merited success of their efforts to maintain the reputation the Richmond Show has so long enjoyed.

Plants, Trade Groups.—Messrs. Laing & Sons, Forest Hill, had a bright group of Begonias, Lilliums, and Orchids set in foliage plants. Messrs. Puttock & Shepherd of Kingston had a very pleasing group of Lilliums, Bouvardias, Petunias, with some good Palms and Ferns for a background. Mr. Gordon of Twickenham showed one of his fine collections of Lilliums with Acers for dressing. Mr. J. Chambers of Hounslow had a collection of Diplacis, Phloxes, &c., with beltings of his fine white Viola Snowflake.

Competing Groups.—Of these there were three in the chief class, and Mr. W. Brown of Richmond, practically the champion of the district, was placed first with one of his best arrangements, in which a few highly coloured Crotons and Lillium auratum told well. Messrs. Fromow & Sons, Chiswick, were second, and Mr. W. James of Norwood, who trusted chiefly to Orchids for effect, was third.

Smaller Groups.—The best of these came from Mr. Buckland, gardener to G. J. Adkins, Esq., whose group, if less gay with colour than the second placed one, which was bright with Orchids, was at least far more tastefully arranged. Mr. F. Wigans, gardener of East Sheen, was second. Mr. H. Little of Twickenham had a fine collection of Orchids not for competition, which formed a special attraction. There were Cattleyas, Oncidiums, and Miltonia vexillaria in quantity, and numerous other forms in great beauty. With competitive plants Mr. Little was well first with six bold specimens, having Cattleyas Mossiae

and Mendeli, *Lælia purpurata*, very finely flowered, and huge pans of *Cypripediums Veitchi*, *barbatum superbum*, and *Lawrenceanum*. Mr. James was second, having a good piece of *Cymbidium Lowi* and good *Cattleyas*.

Stove and Greenhouse Plants.—Mr. Finch, gardener to J. Marriott, Esq., of Coventry, was an easy first with six specimens, having *Erica Cavendishiana*, *Ixora Williamsi*, *Darwinia fuchsoides*, and good *Cattleya Gaskelliana* as his best plants. Mr. James was second, and Mr. A. Bates, Poulett Lodge, Twickenham, third. In another class Mr. Bates was a good first with six capital plants. Palms and Ferns were all fairly good, but in the press of matter we cannot further allude to them. *Fuchsias* were small and far below the old Richmond standard.

Pelargoniums made a brilliant show, Mr. C. Turner having first place with six fine show varieties in *Despot*, *Goldmine*, *Outlaw*, *Amethyst*, *Martial*, and *Marguerite*, finely flowered; Mr. Hibberd, gardener to W. Clay, Esq., Kingston, coming second with small plants. Mr. Turner was the only exhibitor of *Pansies*. In a group competition for *Pelargoniums* Mr. Turner was again first with some superbly flowered plants, the which were marred by far too large labels. Mr. H. Little came second with a very gay group; also Mr. Hibberd showed a bright group, but not for competition. In the Zonal class, the sixteen plants staged making a brilliant show, Mr. Coombs, gardener to W. Furse, Esq., Teddington, was placed first with *Robert Bloomfield*, *Henry Jacoby*, *Mrs. Gibson*, *John Gibbons*, and *Queen of the Belgians*. Mr. Little was placed second, having some very fine singles, and Mr. Barnes, gardener to S. Graham, Esq., was third. Mr. Little was the only exhibitor of *Ivy-leaved forms*; he also had the best six *Begonias*, other plants being poor indeed. There was good competition in two classes for nine *Gloxinias*, in one class Mr. Coombs having the best; Mr. Waite, gardener to the Hon. Colonel Talbot, Esher, whose fine plants had been too much shaken, coming second. In the other Mr. White, Redlees Gardens, came first, also with good bloomed plants, and Mr. Hooke, gardener to J. R. Hilditch, Esq., was second.

Hardy Flowers.—Messrs. Barr & Son and Messrs. Collins and Gabriel made a fine show with these, the former occupying nearly an entire tent with their display. This included almost all things hardy now in bloom.

The Roses, as already noted, were a wonderfully attractive feature, and the Princess Mary, with her daughter, spent a considerable time in inspecting them. Notes on the winners of the prizes and the classes appeared under the Rose Shows last week.

Table Decorations.—These always form at Richmond a large and attractive feature, but we can only refer to them briefly. Mr. J. Richard had the best three stands dressed in his usual elegant fashion. Mr. Chadwick, Hanger Hill House Gardens, Ealing, was second with others rather too thinly dressed. With two stands of natural flowers Miss A. C. Clarke, Twickenham, came first, having simple *Poppies*, grand *Daisies* and *Grasses*; whilst with a single stand Mrs. Gardiner, of the Police Orphanage, was placed first. Messrs. F. Perkins & Son, Coventry, were first in two classes with superb bouquets, most elegantly arranged; Mr. Hermann, of Bromley, Kent, being second in each case.

Fruit.—Exhibits were plentiful, though in no case very meritorious. Mr. Cakebread, gardener to Sir P. Rose, Bucks, took the first prize for six dishes, having fair *Black Hamburgs* and *Foster's Seedling Grapes*, grand *Grosse Mignonne Peaches*, richly coloured *Lord Napier Nectarines*, *Brown Turkey Figs*, and *Hero of Loeking Melons*. Mr. Osman, gardener to L. J. Baker, Esq., Ottershaw Park, came second, having very good *Black Hamburg Grapes*, wonderfully coloured *Elruge Nectarines*, &c. The latter was first with three bunches of *black Grapes*, having good *Hamburgs*, whilst Mr. Thompson, gardener to Messrs. W. & E. Wells, of Hounslow, came second with very good *Madresfield Court*, Mr. Cakebread coming third with the same kind. Mr. Osman had the best whites in handsome but greenish *Muscat of Alexandria*. Mr. Bates, Poulett Lodge, Twickenham, had the best three bunches of *Hamburgs* in the local class for *black Grapes*, and Mr. Munro, gardener to C. D. Paul, Esq., Twickenham, the best three bunches of *Buckland Sweetwater*, in the white Grape class. The latter also had the best four dishes of fruit. Mr. Bates came first with a pretty *Queen Pine Apple* in that class. Very richly coloured *Lord Napier Nectarines* from *Orleans House* were the best in their class; and *Condor Peach* proved the best in its class, shown by Mr. Sullivan of *Rochampton*. The best dishes of *Strawberries* were *President* and *Sir J. Paxton*, shown by Mr. Howell of Twickenham.

Vegetables.—In the open classes Mr. Waite, as usual, took the chief prizes, being first in the class for twelve kinds, with fine *Early London Cauliflowers*, *Globe Artichokes*, *White Tripoli Onions*, *Duchess of Albany Peas*, *Ashleaf Fluke Potatoes*, *Perfection Tomatoes*, &c. Mr. Garrod, gardener to T. M. Tindall, Esq., Twickenham, was second; and Mr. B. White, Redlees Gardens, Isleworth, third. In a class for nine kinds (the prizes given by Messrs. Jas. Carter & Co.) Mr. Waite was again first, as also in an open class for the prizes offered by the *Native Guano Company*. Mr. Coombe, gardener to the *Comte de Paris*, *Sheen House*, was second in the Messrs. Carter & Co.'s class. There was excellent competition in classes for *Cucumbers*, *Melons*, &c., the prizes offered by Messrs. Sutton & Sons, Reading; and also in numerous other vegetable classes.

[This report was unavoidably crowded out last week.]

TWICKENHAM SHOW.

THE above Society held its twentieth Exhibition in the grounds attached to Poulett Lodge, Twickenham, on July 3rd last, and the four large marquees erected for the purpose contained a varied and interest-

ing display. Plants, cut flowers, fruit, and vegetables in the amateurs' and gardeners' classes were well represented; the cottagers also had a tent, in which were staged their numerous productions. The competition was not quite so keen in some of the specimen plant classes, and the fruit classes, which have received extra encouragement in the shape of additional prizes, were not so well filled, but the season has had something to do with this no doubt. Altogether the supporters of the Society had every reason to be satisfied with the Show, in the production of which the Hon. Sec. (Mr. J. F. G. Pugh), with the Committee (especially Mr. Bates) worked so energetically.

Some reference is made in another page to the floral exhibits, which constituted one of the most important parts of the Show, and to the other departments we can now only devote a brief space, owing to the pressure on our columns this week. In the plant marquee Mr. H. Little was first for six well-grown and freely flowered *Orchids*, chiefly excellent *Cypripediums*. The same exhibitor also had a handsome group of *Orchids* not for competition, which was very highly commended; and in the afternoon Mr. Little, who is a very skilful amateur photographer, showed a marvellously fine representation of the giant Aroid, *Amorphophallus Titanum*, which recently flowered at Kew. Specimen plants were shown by Messrs. Parsons and Munro, who shared the honours between them both for fine-foliage and flowering plants.

The groups invariably make a pleasing feature at Twickenham, and on this occasion a large marquee was devoted to them. With a group in a space of 100 square feet Mr. H. E. Fordham of Twickenham was first with a most tasteful and well-finished arrangement, followed by T. Twining, Esq. (gardener, Mr. Parsons), and Mr. Goodwin. In the smaller group class G. J. Atkins, Esq. (gardener, Mr. J. Buckland), was first; Messrs. Little and Twining being second and third. In the Grape classes Messrs. Thompson and Waite won the chief prizes, the latter also securing first honours for vegetables. Of the non-competing the specimen plants and *Poppies* from Lieut. Nicholson, Poulett Lodge (gardener, Mr. Bates), a group of *Caladiums* from Messrs. Hooper & Co., the splendid collection of *Roses* from Messrs. J. Veitch & Sons, and the choice *Roses*, including eight very fine blooms of *Her Majesty* from Mr. Wm. Tayler, were the principal, besides those already mentioned.

FRUIT FORCING.

VINES.—*Late Grapes*.—Examine these without delay for the final thinning, giving the berries ample room for swelling, so that air can pass through the bunches and admit of ready scrutiny for decayed berries. Keep the Vines free from all gross laterals, not allowing them to make strong entangled growth and have to remove it in great quantity. It only gives a check to the roots, and is one of the chief causes of shanking. Afford copious supplies of water or liquid manure, and mulch with light open material.

Young Vines.—Afford water liberally, mulching and keeping the border moist so as to encourage surface roots. Maintain a moist atmosphere by frequent sprinklings of available surfaces, and syringe the Vines on fine afternoons, closing early to attain a heat of 90° or 95°. Ventilate freely through the early part of the day to insure a short-jointed solidified growth, and allow the laterals above the wood the Vines are to be cut back to ramble at will. Do not permit any interference with the principal leaves that feed the buds at their base expected to fruit next season. They must have full exposure to light and air, and be kept clean and healthy as long as possible.

Pot Vines for Early Forcing.—The growth being completed lessen the supplies of moisture, discontinue syringing, moderating the supply of water at the roots, admit air freely, and afford all the light practicable to the principal foliage. If the canes do not ripen well keep through the day at 85° to 95° by moderating the ventilation, and admit air freely at night.

PEACHES AND NECTARINES.—*Early Houses*.—The fruit being cleared off, syringe forcibly to dislodge red spider. Cut away all shoots that have borne fruit except extensions, and do not leave more shoots than will be required for next year's fruiting. Winter pruning should be abandoned. If the roof lights are not moveable, ventilate to the fullest extent possible, and give the inside borders thorough waterings with liquid manure, which will help the trees to swell the buds. If the roof lights are moveable, take them off about the middle of the month. Rain has a peculiarly invigorating effect on forced trees, and the borders become thoroughly moistened in autumn.

Succession Houses.—With the fruit taking the last swelling, syringe forcibly to keep down red spider; indeed, the trees must be cleansed of the pest, if there be any, before the fruit commences ripening, either by means of the syringe or the application of the insecticide. Supply liquid manure abundantly to inside borders, unless the trees are gross, when it will only aggravate the evil. Mulch inside and outside borders, keeping the material moist, so as to have the roots active near the surface. Ventilate a little constantly, and increasing with the advancing sun. Main-

tain the day temperature at 80° to 85° with sun, and close sufficiently early for a rise to 90° or 95°, and admit a little air before night. As the fruit approaches ripening ventilate more freely, and do not allow so great a range of temperature. Keep water from the fruit, but damp the house, especially on hot days. Tie and regulate the growths, having the fruits well exposed to the sun. Stop laterals to one or two joints of growth, and avoid overcrowding.

Late Houses.—Train the growths thinly, keep laterals closely pinched, and stop gross growths so as to cause an equal distribution of the sap over the trees. If not restrainable by pinching remove some growths altogether. Reduce the fruits to the number that will be required for the crop, and keep the temperature steady by liberal ventilation on all favourable occasions. Syringe to keep down red spider, water and mulch inside borders, also outside if the weather be dry. Be guided in the use of liquid manure by the condition of the trees. If not too vigorous and carrying heavy crops liquid manure will be necessary, yet not so much as for weakly trees, but keep it from trees that make strong wood and have a tendency to become over-luxuriant.

CUCUMBERS.—A few seeds may now be sown for late summer and early autumn fruiting. The plants from this sowing will be ready to plant out in about a month. They grow well in frames, and come in useful where plants from having been in bearing some time are exhausted. Plants in full bearing must have attention in thinning exhausted growths, removing bad foliage, stopping, tying, and regulating so as to keep up a succession of bearing wood. Add a little fresh soil to the bed from time to time, and a light mulching of stimulating material. Syringe at closing time, and maintain a moist atmosphere all day; it is infinitely better than shading. Avoid too much moisture in dull weather; it only makes the growths soft and the foliage more susceptible of injury on a bright period ensuing. Afford liquid manure copiously once or twice a week, according to circumstances. Close early, or at 85°, and so as to gain 5° to 10°, and only employ fire heat to prevent the temperature falling below 60° at night. Avoid overcropping, especially with young plants, and do not allow the fruit to hang too long, as these exhaust the plants and prevent in a great measure a good and continuous supply.

STRAWBERRIES IN POTS.—With young plants that were planted out last year there will be a good supply of vigorous runners. Some difference of opinion prevails as to the most serviceable plan of layering the runners—viz., whether it is best to do so in small pots, and when they are well rooted detach and shift into the fruiting pots, or layer at once into the pots the plants are to be fruited in. Both plans are good. In either case it is essential that the first runners, which give the best plantlets, should be selected, and that they be induced by attentive watering to fill the pots with roots, so that by after judicious attention they may develop into good plants and form well-developed crowns. If layered into the fruiting pots they need not be detached until they have become thoroughly established. Those layered in 3-inch pots should, so soon as they have filled the pots with roots, and before they become much matted around the sides, be detached and stood in a shady place for a few days preparatory to shifting them into the fruiting pots. These should be 5-inch for early forcing, and 6-inch for succession, whilst 7-inch may be employed for plants that may not be required for starting before February or March for affording late crops of larger fruit. For early forcing we find none surpass La Grosse Sucrée and Vicomtesse Héricart de Thury. The fruit of the latter is, however, small, but of excellent quality. Probably Noble will come to the front as a first early forcing variety. It was the best of any last year with us as a second early. In size it is all that could be desired. Other sorts that usually do well are Sir Joseph Paxton, Sir Charles Napier, Auguste Nicaise, and Dr. Hogg. The fruiting pots must be clean, have a large crock in each, about three or four of smaller size, and over these half-inch bones, the drainage altogether about an inch or a little more. Turfy loam, rather strong, should form the staple of the compost, laid up sufficiently to destroy the herbage, tearing or chopping up, adding a quart each of soot, dissolved bone, and wood ashes to every bushel of the loam, thoroughly incorporating. The compost should be moderately dry when used, for if wet it will shrink after potting, leaving the sides of the pot. Place the rougher parts at the bottom first, and ram it hard, potting firmly, and so that the base of the crown is about half an inch below the rim. Stand the pots on a hard base in an open sunny situation, with sufficient space between them to allow for the full exposure of the foliage. Give water as required, and sprinkle the foliage a few days after potting. When the roots are working freely in the fresh soil copious supplies of water will be needed, not allowing the foliage to flag. Remove all runners as they appear.

KITCHEN GARDEN.

PEAS.—The weather of late has been very hot and dry. Later and midseason Peas matured before they were due, nor are they juicy and as sweet as is desirable. We have done our best for them by mulching with manure and short grass, also by watering copiously every other day, which benefited them greatly. Those trying new Peas for the first time this year would do well to be careful in passing judgment on their merits, especially as to flavour, as they are deprived of this during a period of drought.

PLANTING WINTER GREENS.—Many persons who have deficient space plant their winter crops between Potato rows. We adopt the plan, but not until the stems of the Potatoes are dying. In planting now moisten the roots in a puddle, and insert firmly in the hollows

between the rows. Do not move the Potato stems more than is necessary, as by coming close up to the Greens they will afford them shade and assist their establishment.

GLOBE ARTICHOKE.—Should the heads of these be maturing more quickly than they can be used, do not allow the old ones to remain until they flower, as this will weaken the growths considerably, and may be the means of preventing another crop forming in the autumn. If they cannot be used when ready cut them off and throw them away, or ask the cook to preserve them for the winter before they have become too old.

SPRING CABBAGES.—It ought now to be decided what is to be done with the stumps from which Cabbages have been cut. Sometimes we have allowed them to remain to form side heads in the autumn, and they are very productive, but at present we have so many young plants that we are clearing off the old and planting for late autumn and winter use.

DWARF KIDNEY BEANS.—We gathered our first dish from Ne Plus Ultra in the open on June 29th, and the pods are forming freely, but we fear they, too, will mature too rapidly. When the pods become so old as to contain firm Beans the later pods will cease swelling, therefore all who wish to maintain a succession must gather the pods closely as soon as they are large enough for use. Early in the season or at present the markets are not overstocked with them, and surplus produce may be profitably disposed of.

SPINACH.—It is now difficult to get this to form large leaves, as the drought causes the plants to form seed stems prematurely. We find Spinach grows best at this season between Raspberry rows and fruit bushes, where the soil is cool and partially shaded. We also find the prickly or winter variety less influenced by the heat than the round-seeded or summer variety, and we advise those who have failed with the latter to try the former.

TURNIPS FOR WINTER.—Turnips are in daily use in the kitchen, and it is very important that there be a continuous supply of them throughout the winter. We shall now make a large sowing. Drills will be opened 15 inches apart, and if dry each will be saturated, and the seed sown immediately afterwards, covering it at once. The moisture will thus be retained, and cause rapid germination with a free first growth, which is important in Turnips. The Swedish variety, Orange Jelly, and Chirk Castle are all excellent winter sorts. The Swede may be regarded by some as being coarse, but it is very hardy, and if only grown to a garden size is extremely good.

ONIONS.—So far these are free from maggots, and there is no indication of an attack. We have not attempted to thin more of our spring Onions than have been required for use, and although rather crowded they are bulbing well. We shall not thin in the regular way now, but allow all to remain. These may be smaller than if grown 6 inches apart, but small Onions are not objected to if sound, and they invariably keep better than the large ones. We are of opinion it is now dangerous to thin Onions, as two or three instances have come under our notice of late where thinning was not done until the plants were well advanced in growth, and immediately afterwards the grub destroyed the bulk of those that were left.

THE BEE-KEEPER

NOTES ON BEES.

SUPERING.

ALTHOUGH the weather has been fine, and some of our hives increased 14 lbs. in weight on several consecutive days, I considered it injudicious to put on supers until the honey flow sets in earnest. Had I supered a week or more since they would have been tolerably well filled with combs and honey, but in an unfinished state, and if kept on till they were finished, second-class quality, almost unsaleable, would have resulted. Supers can only be obtained of first quality when they are placed on the hives and tenanted at once by the bees at the commencement of the honey flow. The bees then commence working in earnest if the weather is fine, and fill and finish supers of the very best kind. All our stock hives have sufficient honey collected to last the bees for a year, and all that is to be gathered now will be surplus, and of the finest quality, which cannot be said of those hives a half or a third less in size.

YOUNG QUEENS.

From now until the end of July is the best time to raise queens for the work of next season. The most reliable are those raised from a very populous stock, and as they creep out of their cell, or are about to do so, is the proper time to take them and place at the head of queenless nuclei formed from another stock.

I have just formed two nuclei with Pumice (?) queens at their head, kindly sent me by "A Hallamshire Bee-keeper." More lively queens I have not seen; the slightest movement of the body makes them start and try to conceal themselves. One of the queens is about the largest I have had, and if their progeny is equally vigorous we shall have very strong workers indeed.

CARNIOLIANS.

As time goes on I am still more favourably impressed with the hardiness and good working qualities of this breed. They are so docile that for twelve or thirteen years I have had them I never knew a bee to attack anyone. When crossed with other varieties, however, they use their stiletos freely; but I cannot understand why some people insist that they so closely resemble the common black variety as to be scarcely distinguishable from them. At a distance the Carniolian bee is easily distinguished from the common bee, and crosses with that variety betray their character by their less tapered body and darker colour, which any experienced bee-keeper can, at a glance, recognise. Some persons object to them because they say they are much given to swarming. They are not more liable to swarm than other varieties, and are less prone to it than some. They are lively at swarming, and refuse to settle quickly, and after swarms are sometimes more numerous than Ligurians are. This, however, is easily prevented by the timely excision of royal cells.

HINTS TO BEGINNERS.

I gather from my correspondence that there are many who are only beginning to keep bees. The first thing for them to consider is the procuring of stocks. They are advised to visit some established and well conducted apiary and there ascertain what a good stock of bees is like. Then will be the time to make the necessary purchases in bees and appliances, taking care not to procure more than may be required, nor articles which may be of no use. A hive that is to be sent home must be thoroughly ventilated. A common straw hive only requires a cheese cloth placed under the corners, tied at the top, and a cord wound round the body; the hive to be then inverted and carried by hand; or if sent it may be placed in a box having a piece of perforated zinc on the lid. If an ordinary frame hive is obtained a ventilating floor should be substituted for the common one and made secure. Whenever a hive reaches its destination give the bees their liberty; never close them in unless thoroughly ventilated, nor at any time unless for some particular purpose, which I will explain in future.

UNITING SWARMS TO STOCKS.

A Hampshire correspondent desires information on this subject, but has unfortunately omitted to state the number and kind of hives. The principal query is, "What is the best method of uniting young swarms of bees with old stocks?" To be sure of success, both lots of bees should be compelled to gorge themselves with honey or sweetened water (thin syrup), so that the bees will sip it, and not be smeared with it. The swarm should be set close to the old stock a day or so before joining. The swarm in an empty hive or box may be inverted with the bees, and the old stock set on it, when both will unite peaceably, or the swarm may be shaken on to a sheet and the stock placed over it. Two fillets of wood should be laid upon the sheet to prevent the old stock hives crushing the bees. Provided there are young queens in nuclei, or in stocks, for next year's stocks, we advise saving the old queen at present, but if not it might be the best course to kill the old queen, though we have a strong repugnance to this so long as increase of bees is wanted. Young queens in nuclei are always an insurance against loss of stock by the loss of young queens. The subject will shortly be discussed in these pages for the benefit of the inexperienced.—A LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

Seeger & Tropp, 112, Lordship Lane, East Dulwich, London.—*Interleaved Catalogue of Orchids.*

•• All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Purple Pea (A. J. S.).—The pods you send are good samples of the Purple American Pea, an old variety occasionally met with in cottage gardens.

Insects on Gloxinias (F. J.).—We have received your letter but no box containing Gloxinia leaves or insects. Very light fumigations, just sufficient to maintain a smell of tobacco in the house, should be employed early in the season to prevent the attacks of insects of the aphid tribe.

Spongy Peat (H. D. B.).—The sample sent is such as is used by Orchid growers for Cattleyas and some other kinds. It is of no use for plants generally other than those of the nature indicated. We do not prepare analysis of soils. If you do not grow Orchids you can perhaps send a sample to someone who does and ask him to try it.

Pelargonium Sport (J. G. & Co.).—The flowers have arrived quite fresh this time, and the variety which is distinct from Dr. Masters in the show decorative class, and is rich in colour with good substance of petal, appears a promising one for market and for contributing effectively to the floral display in the conservatory.

Double Begonia (W. J. M.).—The flower you send, buff tinged with rose, is very fine, and the variety, especially as the plant is a vigorous grower, worthy of preservation. We have seen some similar in shape, and not very dissimilar in colour, though perhaps not identical. This can only be determined by comparison, and you can, if you wish, send samples to the raiser of the seed, if it was purchased, or to Messrs. Cannell or Laing.

Quality of Peaches (J. V.).—We have tasted much worse fruit than those you send. Are the leaves free from red spider? These insects greatly impair the quality of fruit. Apart from that we think you are overcropping the trees, and in consequence giving stable drainings in excess, or rather continuing their application too long. They should be discontinued when the first fruits change for ripening, and a perfectly sweet atmosphere maintained.

Grapes Scalded (W. W. N.).—The berries sent are what gardeners call scalded, and very much has been published on the cause and prevention during the present season. A low night temperature, with late morning ventilation, are contributory causes, and the evil would doubtless be aggravated by drought at the roots. The temperature ought not to fall much below 65°, with a little ventilation. You have omitted to describe the treatment to which the Vines have been subjected.

Blood Manure (S. E. H.).—It is suitable for Roses and Chrysanthemums that need extra support. To plants in the open ground it may be sprinkled on the soil at the rate of between 1 or 2 ozs. to each square yard, and a pinch between your thumb and finger may be scattered on the soil in 7 or 8-inch pots. You had, however, try its strength on some grass or small weeds, and note the effects. These manures vary very considerably. They may either do good or harm, according as they are used.

Peach Trees Injured (J. W. B.).—We cannot give the "full explanation" you appear to desire, but that is scarcely our fault. The letter should have been posted a day or two sooner. We have no doubt the carbolic acid in the cesspool has done the injury, and you could do nothing better than give pure water copiously. We do not think the trees were in the best of condition before the liquid manure was given, and would therefore be the more liable to injury. We should remove half the fruit or more, then if fresh growth follows, a light crop may perhaps ripen, and if it does it will be quite safe to eat. It appears the Vines could endure what the Peach trees could not. Possibly several roots were not reached. Do not apply any more of the sewage to them.

Flowers for Sale (S. S.).—We cannot recommend salesmen through this journal, but you may write to Mr. Dickson, Central Avenue, Covent Garden, stating your object; he can, and possibly will, advise you how to proceed if you enclose a stamped directed envelope for reply. We should think it would be altogether better for you to visit the market and personally make arrangements for the disposal of your produce. You might learn a good deal that is useful by a visit to the flower market for two or three hours from its opening at about 4 A.M., and subsequently making inquiries. It is entirely different from what you call the "all-the-day-open" market, and the mornings of Tuesday, Thursday, and Saturday are perhaps the best for a visit, though we believe every morning is a "market morning" in the great building, which you have evidently not seen, at this period of the year.

Adiantum cuneatum for Market (R. S.).—This Fern is usually grown in 5 and 6-inch pots in the London Fern-growing nurseries, but some plants are shifted into larger pots. The plants occupy side beds in low houses or pits, and are stood upon ashes or some other moisture-holding material. They must have room to develop their fronds and pay very well for good cultivation. We should not expect the plants to do satisfactorily if crowded together. They can stand moderately thick, and room can be materially saved if all the old or saleable fronds are removed from the plants instead of cutting a few here and there over the whole batch of plants. The plants from which the fronds have been removed can be stood thicker together while they develop others. Those from which the fronds have not been gathered can be given more room until ready or wanted for cuttings. This Fern is improved by dividing and repotting in spring. This practice supplies a fresh medium for new roots, and they do much better again when once established. If they have been in 5-inch pots the ball should only be cut into two parts and each half potted into a 6-inch pot. Feeding is beneficial after the pots become full of roots, but we prefer some fine artificial manure such as Standen's and others to liquid for them, the former being easily applied, and acts very quickly upon the plants; this is what is wanted. A little sprinkled on the surface every three weeks after the pots are full of roots will be ample. There is another point of great importance in growing these Ferns for cutting, and that is, new stock must be raised occasionally. By continually picking the fronds from them as they are fully developed the plants in time become exhausted; in fact, they are much less vigorous, and will fail to yield the same quantity of fronds. Seedlings grow very freely, and some should be raised yearly to replace the weakened plants. If we were growing fronds for market we should always have a quantity of young plants coming forward. A large stock of plants can soon be raised by this method in constantly damp soil and a close, shaded, and moist position.

Raising Strawberries from Seeds (A. E.).—Ripe seed may be procured in two ways:—First, during the first year the plants have produced fruit, collect a sufficient quantity of well-shaped and well-ripened berries, and the best time to do this is towards the end of the full crop, that we may be sure we have got the proper sort, and that we have not gathered the seeds either from degenerated plants or from other varieties which may have intruded into the bed. Put these berries upon a plate, and set them in a dry place out of the reach of mice. They will then decompose and dry up. No danger is to be apprehended from the berries becoming putrid or mouldy, for the decomposition of the pulp tends only to perfect the seeds. The Strawberries thus dried are to be kept till the following spring, when, by rubbing them between the fingers, the seed may be easily separated from the remains of the pulp, which may be thrown away as useless, and then the seeds will remain unmixed and almost perfectly clean. Or, secondly, take the Strawberries, selected as in the former case, and squeeze them in a hair sieve of a pretty close texture; pour water upon them, shaking and separating them at the same time with the hand; press them against the sieve, and in a short time the diluted pulp will pass through and leave the seed. These may be either sown immediately, or kept in a dry place until the spring. Sowing should take place immediately the seed is obtained from the berry, and the seedlings will then bear fruit the next year. Select a light, rich soil with an easterly aspect, so as to be shaded from the mid-day sun; sow very thinly in drills 9 inches apart, and bury the seed not more than a quarter of an inch below the surface. Give gentle waterings daily during dry weather, and keep the seedlings well cleared from weeds. In August thin the plants to 6 inches apart, and those thus removed may be pricked out at similar distances in a like sheltered soil. In the early spring give them a slight top-dressing of leaf mould. Instead of sowing in the open border some gardeners prefer employing pots or seed pans, which we consider necessary where small quantities of hybridised seed are to be sown; in that case the pans should be placed in a warm aspect, and on ground where the worms cannot penetrate. If placed in a frame it will be an advantage, or a handglass, when only a single pan is sown placed over it to protect it from violent rains, as well as to forward the germination. A thin mixture of common whitening and water, and a thin coat of this laid on the inside of the handglass or frame light with a soft brush will be an effectual shade from the mid-day sun, and at the same time will admit sufficient light for the seeds to germinate and grow till they are strong enough to bear exposure to the sun and air.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds

should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (C. A. L.).—1, A Potentilla, perhaps Hopwoodiana; 2, Melilotus albus; 3, Aconitum Napellus; 4, Sedum ibericum; 5, Armeria maritima; 6, Veronica incana. (G. B.).—Gleditzia horrida, the "Crown of Thorns." **Cypripedium (H. T. F.).**—We have no flowers in hand for naming. Please send another specimen and we will name it if possible.

COVENT GARDEN MARKET.—JULY 10TH.

Market heavily supplied with all classes of goods. Prices with little or no alteration.

PASTURE FARMING.

PROFITABLE economy is a definition of modern farming that is singularly expressive of the spirit that should govern all practice,

and of the test to be applied to all attempts at improvement. It is a safeguard both against extravagance and parsimony, and points to the happy mean that spends wisely and saves wisely. The term really implies profitable expenditure and the avoidance of wasteful outlay, or the culture of any crop, the rearing of any animal upon which a fair profit is not tolerably well assured. Anything like precision in farming is impossible, our best efforts often falling short of the success they deserve through causes beyond our control, and we certainly do well to avoid all such risk of failure so far as we can.

As a means to this end it appears highly desirable that much more attention should be given to pasture farming than it has hitherto received. It is a question for the consideration of every farmer, if it is not in his power to avoid altogether the cultivation of root crops. They are proverbially uncertain, are very much the sport of seasons, are certainly very costly, and are by no means so indispensable as is generally supposed, and we hope that as greater attention is given to the cultivation of pasture it will be found that forage in one form or other is a suitable substitute for roots. On many—on most farms—roots are now thought to be indispensable. Why? If only for the nutriment they contain, then certainly fair comparison is much in favour of forage. Take the test of analysis, and we find Mangold roots are composed of water, 88.0; albuminoids, 1.1; fats, 0.1; carbo-hydrates, 9.1; ash, 0.8. Swedes have of water 89.4; albuminoids, 1.4; fats, 0.2; carbo-hydrates, 7.1; ash, 0.6. Yellow Turnips—water, 90.5; albuminoids, 1.4; fats, 0.2; carbo-hydrates, 5.8; ash, 1.0. White Turnips—water, 92.0; albuminoids, 1.0; fats, 0.1; carbo-hydrates, 5.2; ash, 0.6. Compare with these an analysis of grass silage, and we have water, 73.530; albuminoids, 2.305; carbo-hydrates, 11.605; woody fibre, 8.140; ash, 3.920, which shows a balance of nutriment much in favour of the silage, and it is very much more in favour of hay and Oat or Barley straw. As an example of how such analyses are turned to practical account, take an ordinary full-grown healthy dairy cow. We know that its food should contain in, say, 25 lbs. of dry matter daily, 2.5 lbs. of digestible albuminoids, 0.4 of fat, and 12.5 of carbo-hydrates, and it is certainly our concern to impart such nourishment in the most economical manner. In summer, with plenty of rich pasture, cows become sleek, and the yield of milk is rich, abundant, and well sustained. Here is an analysis of such pasture:—Water, 78.2; albuminoids, 4.4; fats, 0.4; carbo-hydrates, 10.4; ash, 2.2; which shows at a glance why cows and other grazing animals thrive so well upon it.

We may remind our readers that the literal meaning of science is exact knowledge, and that the formation of permanent or temporary pasture has become a scientific matter of much importance. The preparation of the soil, the selection and sowing of the seed, and the subsequent cultivation have all been thoroughly digested, so that there can be no good reason now for negligence or slovenly practice. Why, indeed, should there ever have been in this matter? It is true that accurate knowledge of the comparative value of forage plants is of recent date, but have even indigenous grasses and Clovers had fair play? Take the majority of old permanent pastures now, and do we not find them infested with weeds, low in fertility, and often deficient in drainage? How anyone paying rent for land can allow it to remain so neglected passes our comprehension. Ignorance? surely not, for if a farmer knows anything of his calling, he knows a weed when he sees it, and knows also whether land is fertile or not. It is true that he may be ignorant of the best way of storing the soil with fertility, of the relative value of forage plants, of the theory and practice of drainage, but he has no excuse for remaining so.

For tenant farmers especially temporary pasture of from three to five years answers best, for if sown down well in carefully prepared soil and fertility sustained full crops are a certainty. Once get the system established upon a farm in conjunction with ensilage, and down goes the labour account, while profits mount up in the most certain and delightful manner. The cost per acre

of a root crop cannot well be calculated at less than £6, and then there is the risk of failure which cannot be ignored. To be able to avoid such outlay and risk is very desirable, and the question of roots *versus* forage is worthy of earnest, thoughtful consideration. Why is it that we find one farmer giving up farm after farm, and another taking them in hand? Is it not because the one clings with stolid persistence to old habits and old cultural practices, while the other is alert and prompt to seize and turn to account every real improvement in practice? No doubt farmers have been pestered with much vexatious advice from well intentioned theorists. But while we ignore fanciful theory, let us strive for an intelligent appreciation of all real progress, and by striving to apply all possible improvement in practice, not only derive due benefit from it, but also show how sensible we are that while the British farmer may be the best in the world, even he still falls far below perfection in his practice.

WORK ON THE HOME FARM.

Now that flies are in full force and are so troublesome to cattle, cows should be put in a cool lodge or cow house during the hottest part of the day, and have as much green food as they require in rack or manger. If left to seek shelter themselves they will run into a lodge or among coppice wood if they can, and remain there for hours without food, and so cause a falling off in the yield of milk. Now above all things this should be prevented by a little extra attention, and it should not be forgotten how much a little dry food at milking time contributes to both the quality and quantity of the milk. We gave particulars of such food a few weeks ago, and repeat them now when they are most wanted. Give 3 lbs. twice daily of a mixture of equal parts of bran, crushed oats, decorticated cotton cake, and Smith's palm nut meal. This mixture so given in addition to a full supply of green food was found last summer to bring up the butter yield per cow to more than double the ordinary quantity.

As the lambs were withdrawn from the ewes they were put into folds on Sainfoin and mixed layers, and let out for a change on grass for a few hours daily. Under such treatment they thrive much better than they would if turned out altogether on pasture. For new permanent pasture sown this spring without a corn crop nothing answers better than lamb folding repeatedly as each growth becomes ready, the object being to prevent seeding and to enrich the soil. The folds are made so small as to ensure a speedy consumption of herbage without harm to the young plant. All sheep and lambs should now be dipped in Cooper's mixture as a preventive against fly attacks and to destroy all insects in the wool. If lambs are required for early hoggets continue giving a full supply of Mackinder's lamb food or crushed Waterloo cake, which is a compound of nutritious food very suitable for them; but if they are for stores or late hoggets next spring they require very little trough food till autumn. Select and mark a certain number of the best ewe lambs for the ewe flock. By doing this annually the flock number is well sustained, and it always answers best to do this with home-bred rather than with purchased sheep, for no man parts with his best ewes if he can avoid it. All over-age ewes should be taken out of the flock and fattened for sale; barrens and all doubtful or faulty animals should be included in this draught.

REMARKS.

30th.—Bright and fine; a little cloudy in evening.
 July 1st.—Fine bright morning; generally cloudy in the afternoon and evening.
 2nd.—Cloudy morning; a little sun in the afternoon; bright evening; cool throughout.
 3rd.—Cloudy and cool.
 4th.—Cloudy morning; bright afternoon.
 5th.—Bright and warm.
 6th.—Bright and warm.
 The third successive rainless week. It is very unusual to have three—but barometer falling and every prospect of rain. Temperature very similar to the previous week—
 G. J. SYMONS.

THE CONSERVATORY IN SUMMER.

THE conservatory usually loses much of the charm in summer that it possesses during the autumn, winter, and spring months. These structures are often not regarded with the same admiration in the summer on account of the great similarity between the flowers and plants employed and those outside, but this need not, and should not, be the case. Forethought is needed in rendering conservatories attractive in summer, as greenhouse flowering plants are somewhat limited in number when those that are doing duty in the garden are deducted. The object in view may, however, be readily accomplished if such plants as Zonal Pelargoniums, Fuchsias, and others are not employed after they commence flowering outside, or only sparingly, as may be necessary to impart colour and variety.

Well-grown French and Fancy Pelargoniums are distinctly attractive, and their flowering period can be prolonged by having a number of plants rooted during April and May. If the pinching of the shoots is discontinued at the end of August these plants will flower early in summer, and others rooted in the spring from young growing shoots continue the display until the end of August or middle of September.

Ivy-leaved Pelargoniums, of which so many beautiful double and single varieties have been raised during recent years, are admirably suited for conservatory decoration, their elegant appearance and charming colours being much enjoyed. No doubt these plants can be grown in the open air, but they cannot there be represented in the best condition, and they are worthy of good positions under glass. Well grown plants are highly attractive.

Liliums are invaluable—indeed, indispensable—until they commence unfolding their flowers in outside beds and borders, and even subsequently good plants and varieties are admissible in the conservatory. I need not, however, stay to enumerate plants which flower in the open air, but propose directing attention to others that are suitable for the purpose in question.

Achimenes are decidedly attractive in appearance in pans and pots, and there need be no scarcity of these plants from June until October if they are prepared successionally by inserting cuttings thickly at intervals of a few weeks. It is necessary to select free and continuous flowering varieties. Gloxinias may be employed with advantage in conservatories, but the plants must not be removed direct there from close moist highly heated stoves, but must be prepared for the positions they are to occupy by being started somewhat late and brought forward gradually. Plants thus prepared produce stout flowers on sufficiently strong stems for dispensing with the aid of stakes. Both Gloxinias and Achimenes last longer and are more attractive under the cool treatment of the conservatory than in the close, moist atmosphere of the stove.

Allamandas, Bougainvilleas, and Clerodendrons are at home in conservatories in summer, provided the plants are watered with care and not exposed directly to draughts. Large balloon-shaped specimens that are admired in exhibition tents are, with few exceptions, useless for the purpose under notice. They are too formal for grouping effectively with plants of a totally different nature. Plants in from 7 to 10-inch pots loosely trained round four or five stakes are the best for our purpose. Prepared on the pot Vine principle, and well ripened by being trained under the roof the first season of growth, we have found them most suitable. The

two former answer best when transferred from 5 or 6-inch pots in which they have been started the first season to their flowering pots, and well grown the second year. They can be prepared in a season, and small well flowered plants are appropriate for certain positions. *Clerodendron fallax* can be raised from seed sown early in the year, and the large trusses of flowers impart brightness without "commonness" to any structure in which the plants are arranged. Cuttings of *C. Balfourianum* rooted early and the plants well grown in 6 and 7-inch pots are large enough for conservatory decoration. Finishing as they do their growth late in the year they require very little retarding to insure their flowering at the proper time.

Begonias of nearly every section are invaluable, but unfortunately these are not employed in the conservatory during the summer to the extent that they deserve. Persons who know their value and grow the plants well do not fail to provide a sufficient number for decoration at this period of the year; but all the same, there is ample room for thousands more to be cultivated for the purpose in question.

We have frequently arranged for a time early-flowering Tydeas, *Ixoras*, and other stove-flowering plants without the least sign of harm having been done to them, though even the few that have been enumerated, if employed in sufficient numbers, give a totally different aspect to many conservatories than they frequently possess during the summer months.

In lofty structures *Campanula pyramidalis*, well grown, is highly effective, forming spire-like masses of flowers 6 to 9 feet high. They associate well with other plants, imparting diversity with agreeable colour to the arrangement.

Kalosanthes are quite distinct from outdoor flowering plants, and are rich without being gaudy. They can be flowered in quite a small state if needed for certain positions, and show to advantage with Ferns and Gloxinias.

Among annuals well-grown plants of *Gomphrena globosa* are distinct from any in open borders. *Salpiglossis* attract by their richly pencilled flowers, *Rhodanthes* by their chaste colours, and *Thunbergia alata* produces a good effect in appropriate positions.

But for the summer decoration of the conservatory we need not confine ourselves to flowering plants, for ornamental foliage plants are equally suitable and impart a tropical aspect to the arrangement, which is enjoyable. Few plants associate with flowers better or produce a more elegant appearance than *Adiantum cuneatum*. If some are grown under the influence of more light than the others two distinct effects can be clearly brought out. Those grown with abundance of light will have fronds of the lightest green, or nearly yellow, tinted with pink; while those grown in the shade will be of the deepest and most pleasing shade of green.

The number of suitable plants is by no means exhausted. *Aralias*, or most of them, would be better in the conservatory than in the stove; in the latter they soon grow too tall, while in the former they make compact growth, and are in the best possible condition for any other form of decoration during the following autumn, winter, and spring. Small well coloured plants of *Pandanus Veitchii* are very effective, so also are well developed examples of *Dracenas Lindeni*, *Cooperi*, *terminalis*, and *gracilis*. These and other stove plants, such as variegated grasses, *Acalyphas* and others, change the aspect of the conservatory in summer, and notwithstanding the wealth of flowers outside do not fail to give satisfaction.

Crotons, well coloured, of any section, whether broad or narrow leaved, have few equals for ornamental purposes. Poorly grown plants inferior in colour detract from, rather than add to, the effect of an arrangement, and should not be used. We often see these plants employed with magnificent effect in the exhibition tent, yet seldom find them equally good in conservatories and similar structures during the summer. Improvement in the arrangement of plants for effect has been apparent in exhibition groups, but these

have not produced the practical results we had hoped for. We trust, however, that in the near future the conservatory ornamentation will be improved correspondingly during the warmest months of the year.—W.M. BARDNEY.

CANKER IN FRUIT TREES—THE INSECT THEORY.

I DO not know whether Mr. J. Hiam (page 6) wishes me to demolish his insect theory or not. It would almost be a pity to do so if I could, as it would deprive him of a subject evidently of great interest to him, and naturally so, as its discoverer. I like to see a man adhere to his convictions as long as he can, and to abandon positions that he finds untenable. This indicates firmness of character with prudence—an undeniably excellent combination.

When Mr. Hiam tells us he has been obliged to give up the idea that his insects only attack certain sorts, or "those they like best," I suspect he nearly throws away his case. If they do not attack those they "like best" they must devote their attention to others which are less palatable, and that is scarcely in accordance with the economy of existence. By the admission I think he must lose his only supporter, Mr. Harrison Weir. I remember having a pleasant conversation with this gentleman on the subject in question; he based his argument in support of the insect theory on the very point which Mr. Hiam says he has "had to give up." I do not expect, however, that Mr. Weir will thus capitulate. I have been careful not to deny the possibility of some insect puncturing the branch of an Apple tree and causing injury that may develop into a wound; but I believe the insect has yet to be discovered that causes canker. Mr. Weir had not seen it at the time of our conversation, and I feel certain such a good naturalist as he is would not admit that the insects Mr. Hiam finds so plentifully in cankered wood, and which anyone may find with the aid of a good magnifying glass, are the cause of the canker.

I happen to have had the opportunity of examining insects from Mr. Hiam's trees, not through a magnifying glass alone, but under the microscope, and they were precisely the same as those I have seen in decaying wood any time the last forty years. Some of the same insects were in the cankered wound on the specimen figured (page 434, May 30th), and they were the consequence and not the cause of the canker. Unless Mr. Hiam has another kind than those I have seen in wood from his garden I am bound to express my conviction that his theory breaks down. He will not agree. May I suggest, then, that he forward samples to the Scientific Committee of the Royal Horticultural Society for examination by its experts? In my belief the insects to which I refer from Mr. Hiam's trees could not live on the smooth wood of the Apple; and without the least hesitation I would place a hundred of them on the choicest tree in my garden. They might find their way to the rougher bark and there live, but I am convinced they are without the means of puncturing smooth, healthy wood.

Clearly they do no harm in cankered crevices when the wounds are healing as in the Impney specimen, for if they did the wounds would not heal. It would be quite as reasonable to say they were the cause of the healing as the cause of the disease.

Mr. Hiam says the insects "move from the healing parts and take up a fresh abode and produce canker." If that is so we might expect them to move to another branch of the same tree as more convenient than making a long journey in search of a variety they do not like, as Mr. Hiam says they do not choose sorts "they like best." I do not think he lives very far from Impney, and I am sure if he can call there Mr. Parker will show him the branch from which the cankered part above referred to was cut, and I think he will have some difficulty in finding a speck of canker on the tree or any others near it. In my experience the insects do not move very readily from their old abodes; it is in fact about as difficult to drive them away as it is to drive a lot of hungry pigs from a trough in which food is placed. I was so well aware of this that I took no precautions to preserve them in the canker-healing cavity. The branch was passed to and fro, was examined by Mr. Tonks, carried loosely about, brought to London, and all the time they stuck to their cabin with the tenacity of a Tipperary man.

Further, if they cause canker then move and take up a fresh abode to produce more, whither can the millions have gone that according to Mr. Hiam's theory must have been at work in Mr. Tonks' garden? There are thousands of healing wounds there since the soil was improved and supplied with the essentials for producing healthier growth, and no fresh wounds are visible. The insect theory entirely breaks down as applied there.

Mr. Hiam's experience in establishing healthy growths by grafting on cankered stocks is not evidence that insects caused the canker, because the results would in all probability have been the same if he had not limewashed and insecticided the stocks and scions. Thousands of cases prove this, and not many more conclusively than the trees in Mr. Garrod's garden at Ipswich, the originators of the discussion on the whole subject. If Mr. Hiam had cured his cankered Hawthorn den by painting alone, he would be in a much stronger position. I have tried my best to cure a favourite tree of that variety, and no doubt destroyed every insect on it, but that did not suffice. The nuts I presented will not, I think, be cracked by insects.

In respect to the frost, if Mr. Hiam reads what I wrote on the page above quoted with the care that is requisite for the purposes of effective criticism, he will find that I did not attribute canker to frost solely,

though I have no doubt it has a much larger share in producing it than insects have, and the healthier the growth the less liable it is to injury. His six-years-grafted Dumelow's Seedling was in a condition to resist the action of frost during the comparatively mild winters in Worcestershire during the past few years. If he had practised in the north for five times that period, and noted the the disastrous effects of frost on trees when the thermometer falls below zero, he would be bound to admit its canker-producing power, though the results are not apparent the first year, except to persons who are familiar with the affection in its early stages.

In respect to Mr. Hiam's facetiousness over Dr. Hogg's trees, I can assure him the one that has so far escaped was not "wrapped up;" therefore, according to his theory, it ought to have been attacked by insects the same as the other two. When canker affects the main stem of one tree and another by its side escapes, and the stocks have been raised from the pips of different varieties of cider Apples, as is customary, there are varietal differences, and it would be a wonder if all of them were equally hardy, and as hardy, as I said before, as stocks of the genuine Crab. If Mr. Hiam has ever had a chilblain on one of his fingers, it does not follow that all other parts of his hand were "wrapped up," nor if frost has bitten one of his toes that it crept in through a hole in his stocking. If he can prove that it has his wrapping-up observation will have force, not otherwise.—W.

POPPIES.

POPPIES are most interesting in their forms and colours, easy to grow, and do not require much space or attention. They are effective in a cut state either in large masses by themselves or with other flowers. The most beautiful are those known by the name of the "Shirley" Poppies, raised by the Rev. W. Wilks of Shirley Vicarage, Croydon, who has obtained a diversity of colours without the black spot at the base of each petal. Amongst many seedlings I fail to find two flowers alike; they range in colour from a brilliant scarlet to the faintest blush and pure white. The soft forms of rose and pink are exquisite. Some red varieties have a pure white edge, and others graduate from a deep rose to a faint pink, while those which are characterised by blotches on the petals are not the least showy. All possess that rounded form so much admired, the petals being entirely free from serration. In no way in a cut state do they show to the same advantage as when arranged in a tall glass of any shape. The base should have a setting of foliage which will hang over the sides of the glass, then place the Poppies in lightly with long stems, associate with them a few long feathery Grasses, and nothing more is needed to set them off. I find they are best cut when the flowers are fully expanded; the stems are then more firm and matured, while the petals are fully developed. In this manner they last from twenty-four to thirty-six hours in good condition. If they are cut too early and before the stems are hardened they droop directly. When cutting the blooms have a vessel containing water alongside, place the stem into the water immediately, which prevents the end being sealed over by the milky sap exuding; in this manner they are able to absorb more moisture, and consequently last a longer time.

The best mode of cultivating these Poppies is by making three sowings in the place where they are to flower, as they cannot be transplanted readily, especially if the weather be hot and dry. If of necessity any plants are treated in this manner with a view to fill gaps in the rows or beds, cover the plants with an inverted pot during the bright part of the day. Transplant them in a young state, and in showery weather if possible. Make the first sowing in October, choosing a warm sheltered position. Plants from this sowing will flower at the end of May. The second sowing should be made the first week in March to flower the middle of June, while a later sowing may be made about the middle of April, when a continuance of bloom may be assured. I sow them in different positions, such as in the herbaceous and Rose borders, in a bed on an east border, and another one on a warm south border which slopes towards the path. I sow the seed thinly, as sowing too thickly necessitates severe thinning of the plants, and if this is not done freely they become drawn. They should not be less than 6 inches apart all ways, and if a trifle more all the better.

Papaver orientale is the next in importance to the Shirley strain, this being a very hardy perennial, which is increased freely by dividing the roots. The foliage is deeply cut, of a dark green colour. The flowers are 6 inches across or more, and are produced on stout stems 3 to 4 feet high during May and June, the colour being a showy scarlet, with a black spot at the base of the petals. In the herbaceous or shrubby borders, backed up with other greenery, they show to advantage, and being a perennial this Poppy is all the more valuable.

The Iceland Poppies (*Papaver nudicaule*) are charming plants, and being of dwarf habit they can be used in a variety of positions. We have them in rows, the yellow and white colours alternately planted. In mixed borders of summer flowering plants, such as scarlet

Pelargoniums and dark Violas, these free-flowering dwarf Poppies are much appreciated, as they make such a pleasing contrast in the colour and form of their blossoms. In the front of the herbaceous borders, and in the most suitable places on the rockery, such as where the soil is deep, these Poppies flourish, commencing to flower early in May, continuing through the summer. Sow seed in gentle heat early in March, pricking the plants out in a cold frame when strong enough, afterwards planting them out finally towards the end of May, when they will commence flowering almost directly. In most instances, unless the position be a wet one, this section of Poppies will stand the winter and flower more freely the following season. Of the three colours perhaps the orange one is the most appreciated; although the white is pure and the yellow most free in flowering, there is a charm about the orange variety which cannot be denied. For cutting purposes this section is invaluable.—M. S.

ORCHID NOTES.

CYPRIPEDIUMS.

I MUST confess to a great liking for Cyripediums. They are remarkably distinct, and there is much that is attractive about them. They also possess the great merit of being serviceable. Theirs is not a fleeting visit, but we have them with us for many weeks or months, and I never tire of them. There are species and varieties for every month of the year, and a collection therefore would always prove interesting to its fortunate owner, and at times could not fail to prove attractive to less interested persons. Some of the species and varieties are rare and valuable, so that there is plenty of scope for the indulgence or fascination of possessing something that everybody else cannot possibly expect to obtain for many years to come.

Without attempting to enumerate all worthy of general culture, or to minutely describe any of them, I shall yet venture to name a few that would succeed almost anywhere, or at any rate where there are facilities for growing other heat-loving plants, giving them somewhat in their order of flowering. For midwinter there is none to excel, or even equal, the good old *C. insigne*, and of this there are several superior forms, including *Maulei* and *punctatum violaceum*. These will succeed under greenhouse culture, but thrive far better when kept in a brisk moist heat till the young growths are well developed, or say to the end of June, after which they ought to be transferred to cold frames and shaded from bright sunshine till the autumn, being returned to gentle heat or a warm greenhouse to unfold the already well-advanced flowers. If kept in strong heat all the year they are liable to do little else but grow strongly, while if given no heat beyond what is necessary to exclude frost the growth is frequently weakly and unhealthy. It is really surprising what a great demand exists for this old favourite, and those who have more plants than they need will experience no difficulty in exchanging them for other Orchids.

C. venustum and *C. Boxalli* also flower during the winter and early spring months; both possess strong constitutions, and never fail to flower freely in a moderately warm house, in which they are grown. Ours are always in a mixed fernery, and are but little trouble. In March, and until the end of July, *C. barbatum* and varieties are available. Especially good are *C. barbatum nigrum* and *superbum*, and whether as single pieces or in large made-up pans they are most effective and durable. They ought never to be out of a moderately warm house for many weeks together.

C. Sedeni and *C. Argus* are also spring-flowering forms, and of easy culture. *C. Lawrenceianum*, with its prettily yellow variegated leaves, flowers in the summer, and is useful for exhibition purposes from May to August. The flowers resemble those of the *C. barbatum* type, and the plants require similar treatment to that species. *C. caudatum* is remarkably distinct, the "tails" of the flowers sometimes attaining a length of 2 feet. It evidently delights in plenty of heat and moisture, and flowers freely in May, June, and sometimes as late as July. This, and the variety raised from it—*C. Dominianum*, ought to be in every collection. The last-named

is the most free-flowering, but the flowers are smaller and the tails shorter.

C. Lowianum, *C. lævigatum*, *C. Stoneanum*, and *C. Harrisianum* are good summer-flowering species. Autumn bloomers are not very numerous, but comprise a few gems, notably the charming *C. Spicerianum*. This lovely species has nearly pure white flowers, and thrives admirably in a brisk stove heat. The pretty little *C. niveum*, though far from being robust, also does well under similar treatment, and this flowers in November and December. *C. concolor* has mottled foliage, and white prettily spotted flowers, quite small plants producing these during the winter. *C. bellatulum*, previously noted in these pages, is a grand addition to the *C. Godefroyæ* section.

Cypripediums generally are best kept in ordinary freely drained pots, and a compost consisting of fibrous peat with charcoal, sphagnum moss, and sand freely added suits them. Too often they are found in a mass of sour close compost, in which they keep alive a surprisingly long time, but only present a very unhappy appearance. They are worthy of better treatment, and ought therefore to be at once turned out of the pots and the roots washed clear of the sour soil. After all the dead parts have been cleanly cut away repot in quite fresh compost, using as small pots as they can conveniently be placed in, and water carefully till fresh roots are in full possession. It is a mistake to be always pulling Cypripediums to pieces and repotting, this greatly interfering with the flowering; but it does crowded clumps of the commoner species good to be divided occasionally, the fresh pans formed soon filling up, and finer flowers are the result.

As far as heat and shade are concerned, what suits most heat-loving Ferns also agrees with Cypripediums. Those well established should, when growing strongly, receive abundance of water, much less being naturally required during the duller months of the year, but at no time should they become dust-dry at the roots. A little clear soot water or weak liquid manure may well be given to the strong well-rooted plants, and a top-dressing of either peat or very fibrous loam benefits the *C. insigne* type especially.—I. M. H.

ONCIDIUM CRISPUM GRANDIFLORUM.

At the meeting of the Royal Horticultural Society's Orchid Committee at Chiswick last week Mr. J. Charlesworth, Heaton,

FIG. 5.—ONCIDIUM CRISPUM GRANDIFLORUM.

Bradford, sent six remarkably vigorous panicles of *Oncidium crispum* bearing the name *grandiflorum*. The flowers were of great size (over 3 inches in diameter), the sepals and petals deep brown with some yellow markings, the base of the lip having a broad rich yellow band. It is evident that the plants must have been grown very strongly, and the cultural commendation re-

commended by some members of the Committee would have been a suitable recognition of this fact; but as it appeared that the variety had been cultivated for some years and maintained its character a first-class certificate was awarded. Exhibitors of novelties or rarities too seldom furnish any particulars concerning the plants they send to the Committee, and it is a great mistake, for often some reliable information would influence an award favourably. *Oncidium crispum* is known to be a useful Orchid, and the variety represented in fig. 5 is one of the best that we have seen.

CUCUMBER ENEMIES.

It is not my purpose to treat of the culture of the Cucumber in general, but I would state in passing that an average atmospheric temperature of 70°, with a fair portion of moisture in it, and a rise from sunshine of from 10° to 15° more, with a fair portion of air, at least during the day, and a bottom heat from 75° to 85° will, with the assistance of rich light soil, grow all the finer kinds of Cucumbers. Those that produce fruit short and stubby will thrive in a temperature from 5° to 10° lower. It may also be added that however grown, whether in house, pit, or frame, the plants will be easier kept clean if trained on a trellis instead of being pegged along the ground, and another inducement for this treatment is that the fruit not only look better when hanging than when lying, but it is green all round instead of being pale on one side. The only disadvantage against the hanging process that I know of is that the neck of the Cucumber is thus made longer; but even here, when a short neck is extra desirable, the Cucumber may easily be placed in a glass case, and slung in a horizontal position.

The first enemy to which I will allude is the aphid or green fly. It is wonderful what a number of them will congregate in a short time on the under side of a leaf if permitted. Allow them to remain on a leaf several days, and the health of that leaf is gone. Allow them undisputed sway over a plant for a week, and unless the roots are extra strong it is next to impossible to restore the plant to health. After trying many things I still prefer tobacco smoke for ridding us of these pests. Here, as well as in all matters relating to the destruction of insects, the old adage holds good, "He gives twice who gives quickly." Use the strongest black shag tobacco, and fill the house with cool smoke whenever you see the first fly. You may depend on it that there are others at no great distance. Delay the operation for a few days and you will have another brood, and hosts of eggs deposited ready for the hatching. If taken in time a second application after a day or two may catch up all those sick but not killed, and those young ones that have just emerged from their shell. These young ones require less strength of tobacco than the older ones. Perform the operation in the evening. Let the leaves be rather dry, and shade from sun the following day. Whatever the mode of smoking see that the smoke is cool.

The second enemy is the red spider. This, though so small as to require a sharp eye to distinguish, is much more destructive than the aphid, and tobacco will by no means smoke him away. The fumes of sulphur, obtained by placing flowers of sulphur in a moist state over a hot-water plate, pipe, or lid of a kettle, the water being heated to from 170° to 180°, is sometimes useful in conjunction with a free use of the syringe. It is, however, difficult to eradicate when once it obtains possession. Prevention is, therefore, better than cure. A damp atmosphere is inimical to this pest, as well as animal life in general. A free use of the syringe when closing in an afternoon is what this intruder will not willingly endure. If, in addition to this, the walls of the house, the back of the frame or pit where the sun strikes rather powerfully, are painted with one part lime and two parts sulphur, and moisture in the atmosphere is maintained, there will be no inducement for this intruder to seek lodgings there. If a few leaves are affected the sooner they are cut off and burnt the better, as if in a vigorous state a Cucumber plant will soon make fresh foliage.

The thrips is even more difficult to eradicate than the spider. Many speak of conquering them with tobacco. I cannot say that I ever succeeded in destroying the enemy before I had also destroyed his feeding ground. Perhaps, however, I did not persevere enough. There is little difficulty in keeping it down when the plants are grown in a house, or so suspended that you can get underneath them. I have known many cases in which the plants were next to destroyed, and yet the owners could not divine what could be the reason. Though the insects are several times the length of a red spider, they are very slim in the body, yet can easily be detected by their jumping on the under side of a leaf. The leaf, though it presents a little of the yellow dotted appearance, the result of the visit of the red spider, has also on its under side a shining glazed appearance, something as if a snail had left its trail there, but on examining it you find this is the consequence of nothing left, but of the juice that has been removed. I have said they may easily be kept down in a house where we can examine and see the under side of the leaves, as the thrips generally select the under side of the oldest finest foliage, and from thence can be dashed with the syringe, or if very bad the leaves may be removed and burned. Various ingredients may be mixed with the water used in syringing. I have found a decoction of Laurel water useful, made by taking as many of the young shoots of the Laurel as, when the leaves were cut in small pieces or bruised with a mallet, would fill firmly a quart pot, placing them in a jar or watering pot, pouring boiling water over them, and allowing to soak for an hour to get good

strong tea from them, and then adding enough water to make from three to four gallons. This, in the circumstances, I have found the most effectual remedy.

As the insects congregate on the under side of the leaf, they cannot easily be reached in beds and pits. Here a few of the worst leaves should be removed, and the plants and walls be well syringed with the Laurel and lime and sulphur water, trying every dodge for getting the water thrown on the under side of the leaves. A smoking with tobacco will do no harm. I have found it more efficacious when a handful of bruised Laurel leaves was placed over the tobacco in rather a moist state, but care must be taken not to burn them much or you may give too strong a dose, and if very particular about your paint and there is much moisture about the house you may have something like a prussiate of lead deposited on it, which will, however, go off by exposure. I have also, in extreme cases, cleared this and every other insect out of frames by placing a quantity of bruised Laurel leaves inside of them. But it is necessary to act with caution, as too large and long-continued a dose will kill the plants as well. A bushel of leaves thus cut and bruised might be placed in a three-light box or pit, but it should not be kept shut for much more than an hour. There is so much more poisonous acid in the leaves at one time than another that if this mode is adopted it should only be referred to in extreme cases, and that with the precaution of making the dose weak enough at first.

I need not say that though these pests are great enemies to the Cucumber, similar modes of eradicating them may be resorted to in the case of other plants affected, bearing in mind that weaker doses must be applied to tender plants, and especially when the foliage is in a young succulent state.

Woodlice.—The destruction of these has frequently been referred to. There are various methods of catching them, and the following is good.

Take a few small bellglasses clean washed inside with such a bait as a slice of Potato, Turnip, or fresh crisp Lettuce leaf in its centre, and plunge it in the bed, so that its edges are level with or rather below the surface of the soil. They can get in easily enough but cannot get out again. Their feet can do nothing in the upright clean glass, and such glasses I have frequently had half filled.

Snails and slugs often do much injury by nipping the young fruit and eating the leaves. They are often introduced in a young state with the soil. A little quicklime mixed with it some time before using and turning several times is a good preventive. The only objection to the use of road-drift and the sand and sandy soil obtained from the sides of roads, so useful for general purposes, is that it is apt to swarm with these pests in an incipient state, and they only want the heat of a Cucumber box to bring them into active vitality. Watering and syringing with lime water will help to keep them down, but this to be effective should be done at night when they are in the wandering mood, as during the day they get into holes and crannies where the acidity of the lime has little chance of reaching them. Brewers' grains are also an attractive bait, on which after dark they may be found feeding. Young Cabbage-leaves or young leaves of Lettuces buttered a little on one side are a good substitute.—F. R. H.

HEREFORD—JULY 9TH.

ALTHOUGH I have known Hereford for some years, and have often enjoyed the hospitality of many of its inhabitants, I had not until this year the opportunity of visiting it during its Rose Show. I have seen its wonderful Show of Apples and Pears, but never its Roses, and there was a peculiar interest to me in going there for the first time to its annual Show, for it was at Hereford, as I have stated in the "Rosarian's Year-Book," that the idea of a National Rose Society was first thought of; and although the idea bore no fruit then, and though the National has never met in the grand old city, yet that fact gave an interest to my visit. This was considerably strengthened by the fact that my friend, Mr. Burnside, who had already originated the Farningham Show in 1879 and the Gloucester Show last year, had undertaken the post of Secretary, and with an energy that reminds one of those riders in the circus who manage to ride two horses abreast, had consented to undertake the management of two shows, Hereford and Gloucester, within two days of one another, and not only to undertake it but to carry it out with success. It was therefore a very great disappointment to all who wished well to the undertaking to find that the day dawned with a dark and ominous-looking sky, and that by the time the Show was opened a continuous downpour marred the efforts of all concerned, and prevented the attendance of those who wished it success.

The wet weather was still more unfortunate, because the Show was held in connection with the Agricultural Show, and instead of the Shire-Hall, the usual place of meeting, a tent was pitched for it close to the entrance of that Exhibition, near the racecourse, and most frequenters of Rose shows know what it is to paddle about on the wet grass on a show day. This was the more to be regretted, as some grand flowers were exhibited. When such famous growers as Mr. Grant, Messrs.

Cranston, and the Rev. F. R. Burnside live in its neighbourhood, it might be taken for granted that they would show in good form, and so they did; although the forwardness of the season had militated against them, as it had done against others, some magnificent flowers were staged.

Amongst nurserymen Messrs. Cranston took the first place, and showed some marvellously fine blooms. In the stand for forty-eights were the following blooms:—Sénateur Vaisse, Lady Mary Fitzwilliam, Ulrich Brunner, Marie Finger, Marie Baumann, Merveille de Lyon, Madame Charles Wood, Madame Marie Mauvin, Alfred Colomb, Countess of Pembroke, Star of Waltham, Duchesse de Valombrosa, Marie Rady, Magna Cbarta, Devienne Lamy, Her Majesty, Silver Queen, Rosieriste Jacobs, Etendard de Jeanne d'Arc, Exposition de Brie, The Bride, Madame Charles Crapelet, Etoile de Lyon, Maréchal Vaillant, Souvenir d'un Ami, Etienne Levet, Captain Christy, Pierre Notting, Madame Norman Néruda, Prince Arthur, Queen of Queens, Duke of Wellington, Reynolds Hole, Madame Willermoz, Louis Van Houtte, Souvenir de Paul Neyron, E. Y. Teas, Viscountess Folkstone, Lord Macaulay, Madame Margottin, Duchess of Bedford, Anna Ollivier, A. K. Williams, Perle de Lyon, L'Eclair, Dupuy Jamain, Dr. Sewell, and Mrs. Laxton. In this stand I may especially notice Marie Baumann, which I think was the finest bloom I ever recollect to have seen of this unsurpassed flower. L'Eclair was wonderfully bright, and Rosieriste Jacobs quite justified the position it has taken amongst rosarians as a fine dark flower, while I have never seen Etendard de Jeanne d'Arc shown so well, and forgive my friend Jules Margottin what I thought was his extravagant praise of this "Dijon" flower. Mr. Frank Cant was a good second, so good a one that there were but three or four points between the two boxes. Messrs. Harkness & Son were third. In the class for twenty-four trebles Messrs. Cranston & Co. were again first with La France, Sénateur Vaisse, Marie Baumann, Merveille de Lyon, Prince Arthur, Marie Finger, Alfred Colomb, Marquise de Mortemart, Marie Rady, Star of Waltham, Rosieriste Jacobs, Etienne Levet, Queen of Queens, Devienne Lamy, The Bride, Etoile de Lyon, Souvenir d'un Ami, Madame Charles Crapelet, Louis Van Houtte, Exposition de Brie, Madame Willermoz, E. Y. Teas, Souvenir de la Malmaison, and Reynolds Hole. Mr. Frank Cant was second, and Messrs. Cooling & Sons, Bath, third. In the class for twelve trebles, Teas, Mr. Frank Cant was first with excellent blooms of Comtesse de Nadaillac, Niphetos, Madame de Watteville, Madame Cusin, Souvenir d'Elise, Princess of Wales, La Boule d'Or, Innocente Pirola, Francisca Kruger, Rubens, and Madame Caroline Kuster. In the class for eighteen single Teas, Mr. Frank Cant was again first with Madame de Watteville, Souvenir d'Elise, Devoniansis, Caroline Kuster, Innocente Pirola, Boule d'Or, Princess of Wales, Madame Bravy, Madame d'Etienne, Francisca Kruger, The Bride, Souvenir d'un Ami, Perle des Jardins, Anna Ollivier, and Marie Van Houtte.

Among the amateurs Mr. W. J. Grant of Hope End, Ledbury, distanced all competitors. His thirty-six was a stand of surpassing excellence, and included fine blooms of Merveille de Lyon, Madame Susanne Rodocanachi, Madame Eugène Verdier, Alfred Colomb, Heinrich Schultheis, Charles Lefebvre, Her Majesty, Duchesse de Morny, Pride of Waltham, Ulrich Brunner, La France, Marie Baumann, Earl of Dufferin, a very grand flower; Emilie Hausburg, Sir Garnet Wolseley, Marie Rady, Marie Van Houtte, A. K. Williams, Madame Caroline Kuster, Etienne Levet, Monsieur Noman, Pierre Notting, a bloom of marvellous beauty, which obtained the silver medal for the best H.P. in the amateurs' class; Marquise de Castellane, Duke of Teck, Charles Darwin, Madame Cusin, Le Havre, Souvenir d'un Ami, Louis Van Houtte, Innocente Pirola, Comte Raimbaud, Niphetos, Etoile de Lyon, Marie Corbet, and Dr. Andry. S. P. Budd, Esq., Bath, was second. In the class for twenty-four, the Rev. F. R. Burnside was first with Catherine Mermet, Baronne de Rothschild, Ulrich Brunner, Madame Gabriel Luizet, Mons. Noman, Marie Van Houtte, Star of Waltham, La France, Madame Caroline Kuster, Alfred Colomb, Etoile de Lyon, Hon. Edith Gifford, Comtesse de Nadaillac, Etienne Levet, Madame de Watteville, Innocente Pirola, Duchesse de Valombrosa, Souvenir d'un Ami, Souvenir de Gabriel Drevet, Anna Ollivier, Merveille de Lyon, Jean Ducher, and Madame Cusin. In the class for eight trebles, Mr. W. J. Grant was again first with Le Havre, Her Majesty, Ulrich Brunner, Merveille de Lyon, Earl of Dufferin, very fine; Duchesse de Morny, Marie Rady, La France, Pierre Notting, Caroline Kuster, Charles Darwin, and Alfred Colomb. Second, Mr. S. P. Budd; and third, Miss Bulmer. In the class for twelve Mr. W. J. Grant was again first with Alfred Colomb, Her Majesty, Ulrich Brunner, Eugène Verdier, Madame de Watteville, Earl of Dufferin, a grand bloom; La France, Duke of Edinburgh, Madame Cusin, Souvenir d'un Ami, Abel Carrière, and Caroline Kuster. In the local class for twenty-four varieties, C. Pulley, Esq., was first with a box containing blooms of George Baker, Pride of Waltham, Marie Rady, La France, A. K. Williams, Duchesse de Valombrosa, François Michelin, Marie Baumann, Maurice Bernardin, Victor Verdier, Alfred Colomb, Comtesse de Nadaillac, Baroness Rothschild, Innocente Pirola, Prince Arthur, Madame Victor Verdier, Ulrich Brunner, Niphetos, Dr. Hogg, Souvenir d'un Ami, Fisher Holmes, Etoile de Lyon, Duke of Edinburgh, and Jules Finger. Jas. Rankin, Esq., was second. In the class for twelve Mr. Pulley was again first with Merveille de Lyon, Marie Baumann, La France, Alfred Colomb, Comtesse de Nadaillac, Charles Darwin, Innocente Pirola, Louis Van Houtte, Baronne de Rothschild, Duke of Wellington, Anna Ollivier, and A. K. Williams. In the class for six, the first prize and bronze medal of the N.R.S. was awarded to Mr. L. Davis, Leominster, for Captain Christy, La Rosière, Star of Waltham, Merveille de Lyon, Pierre Notting, and Madame Gabriel

Luizet. In the class for twelve of one sort, dark, the first prize was awarded to Messrs. Cranston & Co. for a fine stand of Rosieriste Jacobs, the second to Messrs. Harkness & Son for Marie Baumann, and the third to Mr. Frank Cant for Abel Carrière. For twelve of any light Rose, the first prize was awarded to Mr. W. J. Grant with Her Majesty, large; the second to Messrs. Cranston & Co. with Merveille de Lyon, and the third to Mr. Frank Cant with Baroness Rothschild. In twelve of any Rose, Messrs. Cranston & Co. were first with Alfred Colomb, Mr. W. J. Grant second with Marie Baumann, and Mr. Frank Cant third with Madame de Watteville.

There were two other features in the Show besides Roses—stands of herbaceous plants and table decorations. The former were pretty, but did not contain anything very striking. The latter decorations were some of them very good, but unfortunately the tent was dark, and the stormy day made it darker still. There was one table, which gained the first prize, which was worthy of all praise for the delicacy and elegance which marked it. The centre of the table was laid with a very delicate nuance of pink and cream coloured satin. In the centre was a stand containing Water Lilies and Ferns, while round it were small flower-holders with Water Lilies, not too crowded nor too many—together a most charming combination. The second, by Miss H. Biron, was also very pretty. There were also prizes given for bouquets, stands of flowers for hall, centrepieces, &c., some of them very pretty, the principal prizetakers being Miss Talbot, Miss De Winton, Miss J. Rankin, Miss Bulmer, Miss Landon, Miss Davis, and Miss Thomson.

The arrangements, which were carried out under the superintendence of Mr. Burnside, were excellent, and it was a great pity that all was so greatly marred by the very unfavourable weather.—D., Deal.

BROCKHAM.—JULY 9TH.

THE Brockham Amateur Rose Association held its twenty-fourth Show in the grounds of Mrs. Fuller and Miss Barclay at Rokefield, Westcott, near Dorking, on the date named. In 1888 the Show was held at the same place and on the self-same day. This year's Show would have been larger and better if it had been held a week earlier. But it has been difficult to fix suitable days for exhibitions of Roses this year, and shows held later than the end of June have as a rule been somewhat poorly represented in the south.

The members of this noted Rose Association may be congratulated, not only on belonging to a vigorous horticultural society, but also on having the opportunity of enjoying year by year in the best possible way some of the most beautiful spots in Surrey. Rokefield is a type of an English home, well placed, protected from rough winds by fine well-grown trees, and in view of some grand scenery; not too large, but thoroughly comfortable. The garden, in charge of Mr. Firmen, the gardener, is thoroughly well looked after, and with its Coniferae, its herbaceous plants, its trelliswork of Ivy, its well planned and planted beds, and its creepers, is worthy of notice. Everything about it is natural: there is no stiffness. The flowers and plants are there to be enjoyed, not merely to be looked at.

Amongst the many features one very marked one was a square of small beds planted very simply with yellow *Mimulus* (Harrisoni), blue *Lobelia*, *Lobelia cardinalis*, and just rising above these plants was a dark *Linaria*. The effect was very good and striking. A good specimen of the "mock" double Macartney Rose was growing up each side of the steps connecting the two terraces, while the single Macartney was enjoying itself up the wall of the house. The crimson and white *Rosa rugosa*, fine plants on the Manetti, were there, growing side by side, covered with great hips. Clumps of *Lilium testaceum* made themselves conspicuous, also *Delphinium*, notably *Cantab.* *Eryngium amethystinum* was present in its glory, and *Campanula lactiflora*, one of the very best of herbaceous plants, was simply magnificent, also *Alstroemerias* of sorts, and up the balcony there was a fine vigorous plant of *Berberis dopsis corallina*.

At the foot of the terrace the band of the King's Own Rifles (60th), under the direction of the bandmaster, Mr. F. Tyler, played a selection of music by Salaman, Gounod, Bizet, Delbrück, and others.

The Rose Show was held in a large tent, not well enough ventilated, but prettily decorated with flags and devices. There were sixteen exhibitors against twenty last year, and every class but one was represented. Mr. Appleby of the Box Hill Nurseries comes to the front at this Show with his plants for decoration. He sent up two vanloads of Feras and foliage plants. Moreover, he exhibited a box of twenty-four Roses, all of them cut from maiden plants, 4 feet high, large and fresh, a credit to any grower, comprising amongst others A. K. Williams, Xavier Olibo, A. Colomb, Monsieur Noman, Star of Waltham, Sultan of Zanzibar, and Etienne Levet. They greeted the visitors at the forefront of the tent. He had also a fine box of Teas.

Mr. George Paul of the Old Nurseries, Cheshunt, one of the Judges, also showed two boxes, one containing his new Rose Queen of Autumn, and the other The Earl of Dufferin, Sir Rowland Hill, Comte de Paris, Lady Alice, Gloire de Margottin, L'Idéal (very lovely, copper red, chaste Rose), Madame Bois, Madame Henry Pereire, Madame Désir, Lady Helen Stewart, and Madame Hoste.

T. W. Girdlestone, Esq., of Sunningdale, another of the Judges, also brought a box containing some new Teas—viz., Edith, Ethel Brownlow, and The Bride, besides that gem of garden Roses, *berberifolia Hardyi*.

There were three competitors for twenty-four Roses of any kind. Mr. C. E. Cuthell and Rev. A. Cheales, the enthusiastic Secretary, ran each other closely all through the Show. Mr. Cuthell took first honours (the N.R.S. gold medal) with Paul Neyron, Pride of Waltham, Marie

Rady (best Rose in the Show), Magna Charta, Leopold Premier, Comtesse d'Oxford, Pierre Notting, Ulrich Brunner, Duchess of Vallombrosa, Duke of Edinburgh, Ed. Morren, Her Majesty, Marquise de Castellane, Etienne Levet, Baronne de Rothschild, Charles Lefebvre, François Louvat, La France, E. Y. Teas, A. K. Williams, Captain Christy, Marie Baumann, and Marie Finger. Mr. Cheales took second place with a box of almost equal merit, containing amongst others Annie Wood, Clara Cochet, François Miehelon, Charles Lefebvre, Caroline Kuster, Madame T. Levet, Madame Ch. Crapelet, and Maréchal Niel.

These two competitors also took the prizes for twelve Teas in the same order. Mr. Cuthell secured the N.R.S. silver medal for Innocente Pirola, Madame Margottin, Souvenir d'Elise, Alba Rosea, Jules Finger, Marie Van Houtte, Souvenir d'un Ami, Anna Ollivier, Rêve d'Or, Comtesse de Nadaillac, Caroline Kuster, and Madame Lamhard. Mr. Cheales took the bronze medal for a box containing amongst others Maréchal Niel, Madame Willermoz, The Bride, "Rahel," and Marquise de Sanima. Mr. Cuthell's "Baroness" won first prize for nine of the same kind of Rose, and Mr. Cheales with Alfred Colomb took the second prize amongst four competitors. For four triplets Mr. Cheales came in first with Caroline Kuster, Reynolds Hole, Madame Gabriel Luizet, and Countess of Rosebery; and Mrs. Mortimer second with Madame Furtado, Madame Gabriel Luizet, and Duchess of Edinburgh.

In Class 5, twelve of any kind of Rose, the first prize (N.R.S. gold medal) went to Mrs. Leopold Seymour for Heinrich Schultzeis, Marie Rady, Caroline Kuster, Prince Arthur, A. K. Williams, Her Majesty, Beauty of Waltham, Mrs. J. Laing, Baroness Rothschild, Ulrich Brunner, La France, and Geo. Baker. The Hon. H. T. Ryder took second honours (the N.R.S. silver medal) for a fine Duke of Edinburgh, Souvenir J. G. Veitche, Emilie Hausburg, Abel Carrière, &c. A third prize was given to Mrs. Perkins.

Miss Barclay won the N.R.S. silver medal for six good Teas, and Mrs. Leopold Seymour the N.R.S. bronze medal, while Mrs. Perkins took an extra. For six of the same kind of Rose, amongst six competitors, Hon. H. T. Ryder with six good La France, Miss Barclay with Souvenir d'un Ami, and Mrs. Leopold Seymour with Merveille de Lyon took first, second, and third prizes respectively. For six different sorts of any kind Mrs. Poland took the first prize and Mrs. Hatch second, while for three Teas or Noisettes Mrs. Hatch took the first and Mrs. Poland second.

In the Garden Rose collection (a new class) Mr. Cuthell was the one and only competitor, which was a pity. His twelve sorts were Rugosa (two forms), macrantha, lucida plena (very pretty), Paul's Red Pet, Green Rose (very ugly), lucida, Paquerette, Austrian Yellow, Madame G. Brunt, Paul's White Pet, and Gloire de Polyantha.

For what reason the dinner table decorations were so poorly represented it is not easy to say. But so it was. There were only two competitors, Mrs. Cuthell and Miss Fuller of The Rookery. Mrs. Cuthell had filled a choice Burmese silver bowl with Tea Roses and Ferns, and the erection was very graceful and cleverly arranged, and deserved the first prize awarded to it. Miss Fuller's decoration, which took second prize, was a centre with four corners, very well done, but the flowers used were of too sombre a tint.

For the drawing-room decorations there was more competition—viz., five entries. Mrs. Benecke took first prize for a very tasteful composition in a tall brown wicker basket, made up of Eucharis, yellow Iris, Tea Roses, white Lily, Passion Flower, and Ferns. Miss Cuthell won second prize with a combination of Eryngium amethystinum and white Galega. A third (extra) was given to Miss Fuller for Alstroemeria, Spiræas, Marguerites, and tall grass. Mrs. Poland's decoration was in a large brown wickerwork nautilus shell, resting on a basis of moss studded with Mule Pinks (uncommon, but bulky). Miss Barclay's decoration of Alstroemeria and dark-leaved Maple was pretty, but showed signs of haste. In the buttonhole class it seems necessary to remind exhibitors that a buttonhole bouquet should be smaller than a hand bouquet; many of those shown are unsuitable for the purpose. But Miss Cuthell, Mrs. Nelson (berberifolia Haidi and Fern) and Mrs. Hatch were good enough to win the three prizes awarded amongst the eight competitors.

Mr. Cuthell's Marie Rady won the prize for the best Rose in the Show (Dean Hole's Book on Roses), but there were several others of almost equal merit.—A. B. ALEXANDER, *Shedfield Vicarage*.

DISS.—JULY 9TH.

THE Diss Horticultural Society, under the able management of Rev. F. Page Roberts of Seole, has had a prosperous career, and is worthy in many points of detail and arrangement of show matters of being held up as an example to the holders of Rose shows in larger and more pretentious places. At this year's Exhibition the Roses were particularly good, probably surpassing all previous displays. The local growers found blooms becoming very scarce, and had considerable difficulty in filling their stands, but fortunately the two first-class amateurs, Rev. J. H. Pemberton and Mr. E. B. Lindsell, were able to attend, and their splendid exhibits were in themselves worth a journey to see. The tents were erected near to the railway station in the grounds of the Rector, Rev. C. R. Manning, who hospitably entertained the exhibitors and Judges. The day was free from rain, and considering that there is no large population to draw from, the attendance of visitors was encouraging.

There is no open class for nurserymen, and five amateurs staged for Class 1, thirty-six Roses. The Judges could have had no hesitation about their award of first prize to Mr. Pemberton, for his blooms were

very large, highly coloured, and most of them fresh. Conspicuous among them were Her Majesty, Marshal P. Wilder, Marie Rady, Victor Hugo, Pride of Waltham, Niphetos, and Madame de Watteville. Mr. Lindsell was second, having excellent specimens of A. K. Williams, Her Majesty, Victor Hugo (brilliant), and a very clean and bright La France. Rev. A. Foster-Melliar was third, his best blooms being Harrison Weir and Star of Waltham. Rev. H. T. Frere staged an unequal collection, containing, however, a good specimen of Star of Waltham and a truly magnificent bloom of Alfred Colomb, which, though at least a day past its best, deservedly obtained the silver medal as the best H.P. in the Show. This Rose was absolutely perfect, half as big again as the Marie Baumann which gained the medal at the Crystal Palace, was afterwards exhibited at two other Shows (Ipswich and Harleston), and attracted attention by its size and form to the end.

Six twenty-fours were shown in Class 2, in which Mr. Lindsell, showing a smaller but more even collection, succeeded in turning the tables on his victor in the larger class, and winning first honours. His best blooms here were Marie Rady and Dr. Sewell. Mr. Pemberton, in his second prize box, had a fine bloom of Devienne Lamy. Mr. Foster-Melliar was third, his best being Marie Baumann.

In the class for eight triplets there were five exhibits, and Mr. Lindsell was again to the fore, having Emilie Hansburg, La Boule d'Or, and Comtesse Nadaillac, large and fine. Mr. Frere was second, his best triplets (considerably smaller) being Reynolds Hole and Comtesse de Nadaillac. Miss Penrice (gardener, Mr. Morris) was third.

Five boxes of twelve Teas were shown, and a wonderfully level lot they looked—none very large, the pride of bloom being evidently over, but clean and fairly well shaped. There was really not so very much to choose between the best and worst box of the five. The first prize eventually fell to Mr. Frere, in whose box was a bloom of Innocente Pirola—not very large, but perfect, and just at the right stage, which gained the silver medal as the best Tea. He had also a beautifully clean bloom of that lovely Tea, Madame Hippolyte Jamain. Mr. Lindsell was second, having good specimens of Princess of Wales and Niphetos; and Rev. H. A. Berners was third, showing Catherine Mermet and Madame de Watteville well. Mr. Pemberton failed to score by a small margin only. In six Teas Mr. Foster-Melliar was well ahead, showing good blooms of Catherine Mermet, La Boule d'Or, and Marie Van Houtte. Mr. Powell was second, and Rev. J. White third.

Two prizes, to be taken in plants, were offered by Mr. Frant Cant for twelve Roses, including not less than six Teas. Mr. Pemberton was first, having another fine bloom of Devienne Lamy; Mr. Page Roberts second, showing a good Charles Lefebvre. There were two local classes for Roses, which were not strongly patronised, and presented, as usual, rather a depressing appearance.

The classes for wild flowers form generally an interesting competition at Diss, three or four excellent botanists acquainted with the localities of the rarest species in Norfolk and Suffolk entering into friendly rivalry. On this occasion one of these on the Norfolk side was ill and unable to compete, while the Suffolk representative, who relies much on a variety of terrestrial Orchids, was hampered by the earliness and dryness of the season, which did not affect the Norfolk exhibitors, whose strength lies in bog plants. An unfortunate mistake in the judging, and the absence of the names of two of the prizewinners, deprived these classes of much interest. Relief was at hand, however, in four classes for hardy perennials, which are rapidly becoming a leading feature at this and other East Anglian Shows. £3 was offered as first prize for thirty-six bunches (open), but there was no one to oppose Mr. George Paul, whose display was magnificent, among his most noteworthy bunches being Centaurea macrocephala, Telekia speciosissima, Rudbeckia californica, and Delphinium Lanterneur. In the next class, for twenty-four bunches (amateurs), five stands were exhibited. Rev. F. Page Roberts taking the first prize with good specimens. Miss Taylor was second, and the three other exhibits were disqualified for various reasons. The remaining two classes were well filled, but there seems at present a considerable want of general knowledge as to what may be exhibited as a hardy perennial. It is certain, however, that the flowers add much by their colour and variety to the gaiety of the general display, and contribute very strongly to the popular idea of a flower show.—W. R. RAILLEM.

DURSLEY.—JULY 10TH.

A CORRESPONDENT sends us a newspaper report of this Show, observing that as he was a successful exhibitor he hesitated to write an account of the Show himself. In the chief nurserymen's class the prizes were awarded Messrs. J. Jefferies & Sons, Cirencester; G. Cooling and Sons, Bath; and Dicksons, Limited, Chester. The report says the cleanness, evenness, and freshness of Messrs. Jefferies & Sons' blooms were very marked. The other exhibits, considering the remarkably dry season, were admirable, though the effect of the long spell of dry weather was rather too apparent. Chief among the new Roses were Her Majesty, Victor Hugo, and Earl Dufferin.

Referring to the amateurs' and gentlemen's gardeners' classes, the exhibits which gained the first prize in Class 4 (Mr. Budd's) comprised particularly fine varieties, amongst the dark sorts being the Sultan of Zanzibar and Elclair. The second prize (Major Phillips) was gained by fine blooms, the colours being good, particularly those of Dupuy Jamain, Etoile de Lyon, Rêve d'Or, Belle Lyonnaise, and Madame Trifle. The third prize (Mr. Edmunds) included among other good light varieties La France and Ulrich Brunner. Conspicuous in the collection (Mr. Budd's) which gained the first prize in Class 5 were A. K. Williams, Charles

Lefebvre, Comtesse de Nadaillac, and three blooms of S. Reynolds Hole. The second prize, gained by Major Phillips, comprised fine blooms of Bouquet d'Or, Marquise de Castellane, Madame G. Luizet, and Marie Van Houtte. The third prize, awarded to Rev. A. K. Cornwall, contained good blooms of Général Jacqueminot and Paul Verdier. First prize, Class 6, Major Phillips.—Two Roses in this collection secured the two National Rose Society's medals, the blooms being Lord F. Cavendish and Devoniensis, the latter being full of substance. The collection also contained good specimens of Etienne Levet and Marquise de Castellane. The second prize stand (Mr. Budd) consisted of fresh and bright Roses, including good blooms of Alfred Colomb, Ulrich Brunner, Earl Dufferin, and Reynolds Hole. The third prize awarded to Mr. Winterbotham. Class 7.—The Roses worthy of notice in the exhibit which secured first prize, awarded to Mr. Owen, were Rêve d'Or, Bouquet d'Or, and E. Y. Teas. Class 8.—First prize (Mr. Small) was a stand of neat and well shaped Roses, among which may be mentioned Souvenir de Spa and Duke of Teck. Class 9.—Mr. Small gained the first award, showing a very neat collection. In table decorations there was a spirited competition. The winner of the first prize, Major Phillips, showed a remarkably fine collection of Roses, particularly of the Tea varieties. The second prize, gained by Miss A. Aycliffe, was very attractive, the choicest blooms including Baroness Rothschild. Class 13.—The premier prize for a basket of Roses tastefully arranged was won by Miss Cornwall. The second award was carried off by a basket set off well with William Allen Richardson and some good Moss blooms. The exhibitor was Major Phillips. The remaining prize was won by Mr. Champion.

GLOUCESTER.—JULY 11TH.

THE East Gloucestershire Rose Society, which was inaugurated under the auspices of my excellent friend the Rev. F. A. Burnside, held its second Show at Gloucester on the date above named. I recorded the success of the first one held there last year, and the pleasant surprise it had in store for me, and I am glad to have been able to attend its second excellent Exhibition, which, although not equal in extent owing to the character of the season, yet contained some of the very best flowers I have seen this season. The withdrawal of Mr. T. B. Hall was sorely felt here, for his Roses were greatly missed, and the character of the season, which although one of the very best I ever recollect for Roses, has put so many by its forwardness so completely out of the field that the number of flowers exhibited fell short of those of last year, but the quality of the flowers was infinitely better. The two local exhibitors, if I may so call them, though they are both Herefordshire men—Messrs. Cranston amongst nurserymen, and Mr. W. J. Grant amongst amateurs—exhibited in grand form. There was no skimming of Tea Roses as was so much the case last year amongst exhibitors. There were no dull vapid looking flowers amongst the Hybrid Perpetuals as was so much the case then, and there were many blooms of surpassing excellence. The Show was held in the Corn Exchange, an excellently lighted room for the purpose, and it was a pleasure to find that Mr. R. Wheeler was present at our luncheon as the Mayor of Gloucester. All the arrangements were well carried out by the two Secretaries, and as the weather was fine, a great contrast to the Hereford Show, there was a good attendance, and altogether I hope that the Society has scored a success.

In the nurserymen's class, Messrs. Cranston & Co., who have exhibited so well this season, were first in forty-eights with a very beautiful stand of flowers consisting of the following varieties—Madame Eugène Verdier, Maréchal Vaillant, Emilie Hausberg, Le Havre, Madame Lacharme, Madame Charles Wood, a marvellously fine bloom; Her Majesty, Alfred Colomb, Comtesse de Nadaillac, Eclair, very fine; this has been exhibited by Messrs. Cranston this year in better form than I have ever seen it; Baroness Rothschild, Star of Waltham, Marie Rady, very fine; Louis Van Houtte, Marie Cointet, Lord Frederick Cavendish, Etendard de Jeanne d'Arc, very beautiful; Pierre Notting, Francisca Kruger, Général Jacqueminot, Edouard Morren, a fine bloom; Ulrich Brunner, The Bride, Dupuy Jamain, La France, François Louvat, Madame Charles Crapelet, Etienne Levet, Madame Thérèse Levet, Dr. Andry, Madame Margottin, Marie Baumann, a splendid bloom; Merveille de Lyon, Exposition de Brie, Marquise de Castellane, Prince Camille de Rohan, Perle de Lyon, A. K. Williams, Madame Willermoz, Marie Finger, Prince Arthur, Heinrich Schultheis, Sénateur Vaisse, Queen of Queens, and Roisieriste Jacobs, a very fine bloom of a flower which Messrs. Cranston have shown so well this season. Messrs. Maek and Son of Catterick, Yorkshire, were a good second; and Messrs. Jefferies & Son of Cirencester, third. In the class for twenty-four trebles Messrs. Cranston were again first with Alfred Colomb, Madame Charles Crapelet, The Bride, very beautiful; Etienne Levet, Prince Arthur, Queen of Queens, Madame Willermoz, Marie Baumann, Prince Camille de Rohan, Marquise de Castellane, Madame Charles Wood, Marie Rady, La France, Star of Waltham, Louis Van Houtte, Maréchal Vaillant, Baroness Rothschild, Viscountess Folkestone, Exposition de Brie, Roisieriste Jacobs, a very fine triplet; Merveille de Lyon, Alfred Dumesnil, and Sénateur Vaisse. Mr. George Prince of Oxford was second, and Messrs. Jefferies & Son of Cirencester third. For twenty-four singles Messrs. Cranston & Son were again first with Star of Waltham, Charles Lefebvre, Madame Caillat, Pierre Notting, Lady Mary Fitzwilliam, Earl of Pembroke, The Bride, Alfred Colomb, Edouard Morren, Dupuy Jamain, Etendard de Jeanne d'Arc, Madame Charles Wood, Merveille de Lyon, Fisher Holmes, Princess Beatrice, Prince Arthur, Madame Charles, Etienne Levet, Princess of Wales, Devienne Lamy, Alfred Dumesnil, Ulrich Brunner, Marie Cointet,

Lord Frederick Cavendish, Thérèse Levet, Ulrich Brunner, Marie Verdier, Eclair, Queen of Queens, Exposition de Brie, Etoile de Lyon, Sénateur Vaisse, La France, and Maréchal Vaillant.

In the class for eighteen Teas Mr. George Prince of Oxford was first with one of his lovely stands of flowers, consisting of Comtesse de Nadaillac, Madame Cusin, Niphetos, Anna Ollivier, Mons. Furtado, Princess of Wales, Madame Hippolyte Jamain, Marie Van Houtte, Grace Darling, Marcella Rhoda, Madame de Watteville, Cornelia Koeh, Souvenir de S. A. Prince, Hon. Edith Gifford, Etoile de Lyon, Catherine Mermet, The Bride, and Francisca Kruger. In the class for twelve Teas Mr. Prince was again first with Jean Ducher, Princess Vera, Souvenir d'un Ami, Devoniensis, Rubens, Souvenir de Thérèse Levet, Caroline Kuster, Catherine Mermet, La Boule d'Or, Comtesse de Nadaillac, and Niphetos. Messrs. Jefferies & Son were second. In the class for twelve of any one dark Rose Messrs. Mattoek were first with Horace Vernet, Messrs. Cranston second with Alfred Colomb, and Mr. George Prince third with Earl of Dufferin. For twelve of any light Rose Mr. George Prince was first with Merveille de Lyon, Messrs. Maek and Son second with the same, and Messrs. Cranston & Co. third with the same. In the class for twenty-four blooms by Gloucestershire nurserymen Messrs. Jefferies & Son were first with Mrs. John Laing, Souvenir d'Elise, Le Havre, Baroness Rothschild, Duke of Edinburgh, Catherine Mermet, Victor Hugo, Mdle. Susanne Rodocanachi, a very fine flower of great substance; Marie Rady, Ferdinand Chaffalte, Madame Hippolyte Jamain, Lady Helen Stuart, very bright; Paul Neyron, Dupuy Jamain, Comtesse de Nadaillac, A. K. Williams, Captain Christy, Duke of Teck, Maréchal Niel, and Marshal P. Wilder. This was a very beautiful stand. Messrs. Heath and Son of Cheitenham were second.

Passing now to the amateurs it will be found that Mr. W. J. Grant occupied the same place amongst amateurs that Messrs. Cranston did amongst nurserymen. His stand of thirty-six, in which he was easily first, contained Lady Sheffield (a remarkably fine bloom), Niphetos, Mrs. Jowitt, François Michelin, Etienne Levet, Baroness Rothschild, Madame Hippolyte Jamain, Horace Vernet, Madame Gabriel Luizet, Alfred Colomb, Duchesse de Morny, Louis Van Houtte, La France, Abel Carrière, Innocente Pirola, Le Havre, Her Majesty, Duke of Edinburgh, Marie Verdier, A. K. Williams, Souvenir d'un Ami, Earl of Dufferin (very fine), Merveille de Lyon, Général Jacqueminot, Marie Finger, Pierre Notting (a magnificent bloom), Madame Cusin, Marie Baumann, Heinrich Schultheis, Comtesse d'Oxford, Dingee Conard, Caroline Kuster, Madame Eugène Verdier, Baroness Rothschild, and Emilie Hausberg. S. P. Budd, Esq., of Bath, was second. In the class for twenty-four Mr. Grant was again first with Capt. Christy, Comtesse de Nadaillac, Ulrich Brunner, François Michelin, Dupuy Jamain, Duchesse de Morny, Alfred Colomb, Her Majesty, Earl of Dufferin, Merveille de Lyon, Dr. Andry, Baroness Rothschild, A. K. Williams, Souvenir d'un Ami, Caroline Kuster, Le Havre, Duke of Edinburgh, Heinrich Schultheis, Comtesse d'Oxford, Louis Van Houtte, Emilie Hausberg, Abel Carrière, and Dupuy Jamain. The Rev. F. A. Burnside of Burch Vicarage was second, and Mr. J. Besley third. In the class for twelve trebles Mr. Grant was also first with Caroline Kuster, Madame Cusin, Madame de Watteville, Marie Rady, Her Majesty, Alfred Colomb, La Boule d'Or, Earl of Dufferin, Merveille de Lyon, Abel Carrière, Emilie Hausberg, and Souvenir d'un Ami. In twelve single trusses of any light Rose, Mr. Thomas Hobbs of Lower Easton, Bristol, was first with Merveille de Lyon; Mr. W. J. Grant second with Her Majesty.

In the Tea and Noisette division Mr. W. J. Grant also occupied the premier place. In eighteen Teas he had a fine stand, consisting of Madame de Watteville, Souvenir d'un Ami, Souvenir de Thérèse Levet, Comtesse de Nadaillac, Anna Ollivier, Etoile de Lyon, Innocente Pirola, Catherine Mermet, Madame Margottin, Marie Van Houtte, Princess of Wales, Madame Lambard, Niphetos, Caroline Kuster, Francisca Kruger, Hon. Edith Gifford, Madame Cusin, and La Boule d'Or. The Rev. F. R. Burnside was second. In the class for twelve Teas the same exhibitors occupied the same position. Mr. Grant's blooms were Madame de Watteville, Etoile de Lyon, Madame Cusin, Souvenir d'Elise, Catherine Mermet, La Boule d'Or, Innocente Pirola, Caroline Kuster, Comtesse de Nadaillac, Souvenir de Thérèse Levet, Niphetos, and M. Margottin. Mr. T. Hobbs was third. In the class for six of any one Tea Mr. Grant was first with Caroline Kuster; Mr. Burnside second with Madame Cusin; and Mr. Hobbs third with Caroline Kuster.

There were special classes for Gloucestershire amateurs, so as to give them a chance where the large growers outside would not enter the lists against them. In the class for twelve trusses, Mr. Conway Jones was first with Thomas Mills, La France, Charles Lefebvre, Baroness Rothschild, Merveille de Lyon, Général Jacqueminot, Madame Lambard, Duke of Teck, Souvenir d'un Ami, Marie Van Houtte, Prince Camille de Rohan, and Grace Darling. The Rev. Dawson was second, and Mrs. Wallis third. In the class for six Mr. W. Cooke was first with Edouard Morren, Mrs. Baker, Star of Waltham, Captain Christy, A. K. Williams, and Marie Verdier. Mr. James Grant was second, and Mr. A. Darrett third. In the class for six varieties Mrs. Pike was first with Paul Neyron, Mrs. Jowitt, Baroness Rothschild, Fisher Holmes, and Duke of Teck. Mrs. Walter was second, and Mr. W. C. Firth third.

The National Rose Society's silver medal for the best Hybrid Perpetual was awarded to Mr. W. J. Grant for, I believe, Pierre Notting; and in Teas to the Rev. F. R. Burnside for a beautiful bloom of The Bride.

There was a very spirited competition amongst ladies for the best

basket of Roses with only Rose foliage, and the first prize was awarded to Mrs. Burnside, for a basket which has made me alter my opinion. I have often said that I have never seen a basket of Roses pure and simple which gave me complete satisfaction. I have seen many pretty baskets, but they have been mostly smothered with Maidenhair, which, like charity, is made to cover a multitude of sins, but I must now admit the "Pinafore" axiom of "hardly ever," for this was a most exquisite basket, composed entirely of Teas, and this mostly in the bud or half-expanded form. They were gracefully laid in; there was neither on the one hand nor on the other hand carelessness; they were thoughtfully arranged, and gave a lesson which many might take advantage of. Messrs. Rawlins second, and Mrs. Pike and the Hon. Miss Rae equal thirds.

It will thus be seen that amidst many difficulties the East Gloucestershire Society has again scored a success, and I have little doubt that it is arousing an interest in the county on the subject of Rose-growing which must be productive of good to the interests of the flower, which is so universally and deservedly popular.—D., *Deal*.

ALEXANDRA PALACE.—JULY 12TH.

ROSE Shows are not an annual fixture at the Alexandra Palace, for the sufficient reason that Rose time does not always find the doors of the spacious building open to the public. It has had a chequered career, and several attempts have been made, the majority without success, to make it sufficiently attractive to secure a good measure of public support. Another vigorous effort is being made now, under the managerial guidance of Mr. Lee Bapty, to make it a popular resort, and there may be more hope of success than with the overwhelming competition of the exhibition days. With the Rose Show on the above date was appropriately combined the interesting ceremony of the crowning of the Rose Queen, conducted by Father Nugee, and the decorations, chiefly of Roses, prepared in honour of this event, together with the Exhibition itself, formed a most pleasing display.

The classes were fairly well filled, but the date was a little too late to admit of blooms being shown of the highest class. The Rev. J. H. Pemberton was in excellent form, and Messrs. Paul of Cheshunt, Cooling, Harkness, Burch, and others amongst the trade growers were well represented. The general arrangements of the Show were not unsatisfactory, but the plan of placing small numbered tickets on the stands, and writing out the exhibitors' cards for placing there after the judging was completed, led to much delay, and should be altered another year. It is certainly not an improvement on the usual plan of putting on the exhibitor's card at once and reversing it till the Judges' awards have been made.

The results are appended:—

NURSERYMEN'S CLASSES.

In Class 1, forty-eight blooms, distinct, an extremely neat, fresh, and bright collection from Messrs. Paul & Son, The Old Nurseries, Cheshunt, deservedly secured premier honours. Though not large, the blooms were in very good condition. The varieties were:—Back row: Alfred Colomb, Her Majesty, Marie Baumann, Madame Susanne Rodocanachi (very bright and effective), Madame Prosper Laugier, Merveille de Lyon, Reynolds Hole, Countess of Rosebery, Sénateur Vaisse, Marie Verdier, Abel Carrière, Madame Alphonse Lavallée, Heinrich Schultheis, Duke of Edinburgh, Captain Christy, and Marshall P. Wilder. Middle row: Pierre Notting, Madame Victor Verdier, La France, Victor Hugo, Madame Gabriel Luizet, Maurice Bernardin, Niphetos, Charles Lefebvre, Horace Vernet, Madame Musset, Alphonse Soupert, Harrison Weir, Dr. Andry, Madame de Selve, Comte Raimbaud, and La Duchesse de Morny. Front row: Auguste Rigotard, Etoile de Lyon, Sir Rowland Hill, Mrs. J. Laing, Xavier Olibo, Duke of Teck, Comtesse de Nadaillac, and Etienne Levet, A. K. Williams, Catherine Mermet, Duchess of Bedford, Perle des Jardins, Charles Darwin, The Bride, Mons. E. Y. Teas, and François Michelin. Messrs. Harkness & Son, Bedale, who were very weak compared with their stands at the Crystal Palace, were second, the best blooms being Duc de Rohan, Fisher Holmes (very fine), Madame Lavallée, Baronne de Rothschild, and Mrs. Jowitt. Messrs. G. & W. H. Burch, Peterborough, took the remaining prize, showing very well.

With twenty-four varieties, three blooms of each, Messrs. Paul and Son again won. They had an excellent stand of well balanced flowers. Horace Vernet was perhaps the best, but Comte Raimbaud, Charles Darwin, Marie Verdier, and Madame Alphonse Lavallée were also good. Second, Mr. W. Rumsey, Joynings Nursery, Waltham Cross. Third, Messrs. Cooling, Bath.

Messrs. G. & W. H. Burch had one of the best stands in the Show in the class for twenty-four blooms, single trusses; a few lacked size, but all were in excellent condition. The varieties were:—Back row: Star of Waltham, Violette Bouyer, Marie Baumann, Madame Chas. Wood (very fine), Duchess of Bedford, Elie Morel, Charles Darwin, and Etienne Levet. Middle row: Her Majesty, Charles Lefebvre, Marie Verdier, A. K. Williams, Queen of Queens, Duke of Connaught, Madame E. Verdier, and Xavier Olibo. Front row: Fisher Holmes, Countess of Oxford, Reynolds Hole, Mons. E. Y. Teas, Horace Vernet (fine), Ulrich Brunner, Alfred Colomb, and Marie Rady. The second prize went to Messrs. Paul & Son, Cheshunt, whose best blooms were Etienne Levet, Chas. Lefebvre, Comte Raimbaud and Horace Vernet; and Messrs. Cooling were a very good third.

In the class for twelve Teas or Noisettes Mr. Prince of Oxford's seedling Briar produce was to the fore. He had a very neat stand composed of the following varieties:—The Bride, Comtesse de Nadaillac (very good), Catherine Mermet, Souvenir de S. A. Prince, Madame

Cusin, Niphetos, Princess of Wales, Jean Ducher, Marie Van Houtte (very fine), Souvenir d'un Ami, and Innocente Pirola. Messrs. Cooling were a close second with a fresh, bright, and pleasing stand, and Messrs. Burch third, also showing excellently.

AMATEURS' CLASSES.

With thirty-six blooms, distinct, four competed, and the first prize went to the Rev. J. H. Pemberton, Havering-atte-Bower. He had a neat and fresh lot of flowers, though somewhat small. The Teas were best. The following were the varieties:—Back row: Lady Mary Fitzwilliam, Duchess of Bedford, Hippolyte Jamain (a good bloom), Marie Baumann, J. S. Mill, Horace Vernet, Ulrich Brunner, Exposition de Brie, Merveille de Lyon, Benoit Comte, François Michelin (good), and Louis Van Houtte. Middle row: Général Jacqueminot, Countess of Rosebery (bright and fresh), Marshall P. Wilder, Baronne de Rothschild, Sénateur Vaisse, Madame E. Verdier, A. K. Williams (neat and bright), Henri Lédéchaux, Charles Lefebvre, Alfred Colomb, Madame Victor Verdier, and Catherine Mermet (very large but coarse). Front row: Niphetos, (very good), Abel Carrière, Madame de Watteville, Belle de Bourg la Reine, Souvenir d'Elise Vardon (good), Victor Hugo, Reynolds Hole, Lady Helen Stewart, Comtesse de Nadaillac (large but nearly past), Xavier Olibo, Caroline Kuster (very fine), and Sir Rowland Hill. In the second prize lot of Mr. E. B. Lindsell, Hitchin, a bright fresh collection of small flowers, the best blooms were Her Majesty, Duchess of Bedford (very rich) Dr. Andry, and Comtesse de Nadaillac. At 3.30 P.M., when our representative left the Show, the officials had not placed the exhibitor's card on the third prize stand; it was merely ticketed. Who is No. 35?

The first prize box in the class for twenty-four blooms also came from the Rev. J. H. Pemberton. The blooms were large but somewhat coarse, and the card contained a note by the Judges "Badly put up," which was perhaps hardly called for. The varieties were:—Back row: Ulrich Brunner, large, but very coarse; Countess of Rosebery, Merveille de Lyon, Exposition de Brie, Marie Baumann, François Michelin, Alphonse Soupert, and Countess of Oxford. Middle row: Duchess of Bedford, Marie Verdier, Sir Rowland Hill, Camille Bernardin, Marshall P. Wilder, Baronne de Rothschild, A. K. Williams (good), and Charles Lefebvre. Front row: Earl Dufferin, Madame Victor Verdier, Horace Vernet, Captain Christy, Lady Helen Stewart, Reynolds Hole, Marquise de Castellane, and Dingée Conard. The second prize flowers, those of Mr. Lindsell, do not call for comment. Mr. Mallender, gardener to Miss Mellish, Hodsock Priory, Worksop, was third, and there was one other box. The Rev. J. H. Pemberton again won with twelve blooms, a very neat, fresh, bright stand, the best being Charles Lefebvre, an excellent bloom; La Duchesse de Morny, and Niphetos. Second, Mr. E. Mawley, Berkhamstead; third, Mr. Lindsell, the latter showing most Teas.

Mr. Lindsell won with six Teas or Noisettes, La Boule d'Or, Niphetos, Comtesse de Nadaillac, Jean Ducher, Princess of Wales, and Caroline Kuster admirably representing him. Mr. Pemberton was second with larger but less finished flowers, and Mr. E. King third. The first prize in the local class was accompanied by a special challenge trophy offered by North London nurserymen, and was offered for flowers grown within five miles of the Alexandra Palace. Mr. Bateman, Twisden Road, Highgate, followed up his success in the town class at the National Society's Show by winning somewhat easily; Messrs. Agate, New Southgate, and White, Highgate, being second and third.

OPEN CLASSES.

In class 10, twelve blooms of any 1887, 1888, or 1889 variety, Mr. George Prince was first with a capital box of the deep crimson Earl Dufferin, an H.P. that is likely to prove useful. Messrs. Paul were second with a capital box of Her Majesty, and Messrs. Cooling third with Earl Dufferin. In class 11, twelve blooms of any new Rose, Messrs. Paul of Cheshunt won with a rosy crimson H.P., named The Dowager Duchess of Marlborough.

Mr. Prince won with twelve of any yellow Rose, having a very neat box of Comtesse de Nadaillac, the back row flowers very fine. Messrs. Burch followed with the same variety. In the corresponding class for white Roses Messrs. Harkness & Son, Bedale, Yorks, won with a charming box of Merveille de Lyon; Mr. E. G. King, Cambridge, being second with Niphetos, Mr. Prince third with Merveille de Lyon. For twelve blooms of any red or crimson Rose Messrs. Burch were placed first. They had a moderate stand of Horace Vernet, neat, but not in the freshest condition. One of these flowers was selected as the best Rose in the Show, and was awarded the silver cup offered by Mr. R. Beale. Messrs. Paul were second with a good box of Alfred Colomb, and Messrs. Cooling third with the same variety. Baskets and bouquets of Roses from such masters in the art of flower arrangement as Messrs. Perkins, Coventry, and J. R. Chard, Stoke Newington, were very much admired. The former won with a bouquet and the latter with a basket, both very beautiful arrangements. Roses in pots were only shown by Mr. Rumsey. He had a neat lot of plants and was awarded first prize.

MISCELLANEOUS EXHIBITS.

Very effective groups of plants came from Messrs. T. S. Ware, Tottenham; and B. S. Williams, Upper Holloway; and to each a silver medal was awarded. That of the first-named was largely composed of Liliums, including the beautiful Leitchlini, pale yellow with purplish brown spots; Campanulas, Iceland Poppies, Gaillardias, Irises, Armeria cephalotes rubra, and other fine perennials. Mr. Williams' group, which was made up of indoor plants, included Impatiens Sultani variegata, Cattleya Mendeli, Oncidium janieriense, Miltonia vexillaria, Calanthe masuca grandiflora, Odontoglossum Schlieperianum, Epidendrum cochleatum,

and the beautiful *Cypripedium superbiens*. A silver medal was also awarded to Messrs. Alfred Peel & Son, Wood Green, for their exhibition of amateurs' greenhouses, which are admirably constructed moveable fixtures. The Agri-Horticultural Society, Tonbridge, exhibited their Aeme weed killer, and a broad walk was pointed out in the Palace grounds where experiments in weed destruction had been made with satisfactory results. The weed killer was highly commended. A certificate of merit was awarded to Messrs. Ogden & Co., Wood Green, for greenhouses and frames designed for small cultivators; also to Mr. Phippen, for taste displayed in the decoration of a harp with Roses, which was to be used in the crowning of the Rose Queen. Fertilising moss, exhibited by Messrs. R. Beale & Co., New Southgate, and apparently useful for striking cuttings and growing young plants in, was commended.

EVENTS OF THE WEEK.—The following are Rose Show fixtures for the ensuing week:—To-day (Thursday) the National Rose Society's provincial Show at Sheffield; also exhibitions at Helensburgh and Salterhebble. On the 19th Ulverstone, on the 20th Manchester, on the 23rd Christleton and Tibshelf. The Gardeners' Orphan Fund dinner will be held at Cannon Street Hotel on the 19th. The National Carnation Society's Show is fixed for Tuesday, July 23rd, at the Drill Hall, James Street, Westminster.

BULBS FOR THE ROYAL PARKS.—Messrs. James Veitch and Sons, Royal Exotic Nursery, Chelsea, inform us that Her Majesty's Commissioners of Works have again this season, making the fifteenth time, accepted their tender for the supply of bulbs (*Hyacinths*, *Tulips*, *Crocus*, &c.) for the Royal parks.

LONG BROAD BEANS.—In reference to your question at page 26 on this subject I beg to say that I have gathered specimens of Carter's Leviathan Broad Bean varying in length from 15 inches to 17 inches.—H. W. WARD, *Longford Castle, Salisbury*.

CROYDON SHOW.—We are informed that the silver medal for the best bloom in the local classes for Roses was won by Rev. W. Wilks, and not by Mr. J. Brown, as inadvertently stated in our report.

AT the last Committee meeting of the Richmond Horticultural Society, a resolution conveying a vote of thanks and congratulations was passed to Mr. W. BROWN, florist, St. Mary's Grove Nursery, Richmond, on his success in winning for the third time in succession the handsome Jubilee Challenge Vase, value 26 guineas, given by Mrs. P. A. Lee to the Chiswick Horticultural Society, for a group of plants arranged for effect, and which cup has now become his property.

NOBLE AND OXONIAN STRAWBERRIES.—An "Amateur Strawberry Grower" desires to state his experience with Strawberries. He has been the most successful with Noble and Oxonian. The former produced an early and magnificent crop, and the latter is now yielding splendid solid fruit. For an early and late Strawberry he does not think growers can at present do better than try these varieties.

PRESENTATION TO MR. W. H. WILLIAMS.—Last week there was a very interesting gathering in the banqueting hall of the Council House, Salisbury, the occasion being a presentation to Mr. Walter H. Williams, Hon. Secretary of the Wilts Horticultural Society, in commemoration of his forthcoming marriage. The present was a beautiful cottage piano, the value being 55 guineas. On a silver plate on the front of the instrument was engraved the following inscription:—"Presented to Mr. W. H. Williams, Hon. Secretary to the Wilts Horticultural Society, by the Committee, Exhibitors, and Friends upon the occasion of his marriage, July, 1889." The Mayor (Mr. S. Parker) presided, and having expressed the great pleasure that it afforded him being present on that occasion, he called upon Dr. F. W. Coates to make the presentation. This was done in an able and highly appropriate manner. Mr. Williams, in acknowledging the present in a suitable speech, remarked that "as servants of Nature they—the members of the Horticultural Society—were drawn into association with one another, and were not the beauties of Nature and the harmony of music closely allied? They both tended to elevate and lift them above the daily round of common toil."

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—The thirteenth annual Exhibition of the above Society will be held on Tuesday, July 23rd, under the auspices of the Royal Horticultural Society in the Drill Hall of the London Scottish Volunteers, James Street, Westminster. Upwards of a hundred prizes are offered in varying amounts from 40s. downwards. The southern flowers would be at their best a week previous to the Show, but better blooms will be brought from the midland districts this year. The prospects are good for one of the largest exhibitions ever held by the Society. By the courtesy of the members of the Horticultural Club a luncheon will be provided at the Hotel Windsor, Victoria Street, at 1.30 p.m., for the Judges, members of the Society, and their friends; tickets are 2s 6d. each, and may be obtained through the members of the Society. Robert Hogg, Esq., LL.D., Vice-President of the Society, has kindly consented to preside. The Hon. Secretary will be glad to take the names of ladies or gentlemen to be proposed as members. Subscriptions were due in January. Mr. Henwood Earley, Reading, is the Treasurer, who will gladly receive all unpaid subscriptions, or they may be paid to the Secretary, Jas. Douglas, Ilford, Essex.

"WALKS IN HOLLAND."—Under this title Mr. Percy Lindley has issued another of his sixpenny handbooks to travellers, and persons who contemplate a visit to the eastern shores of the North Sea will do well to possess it, for it is attractive, interesting, and instructive. It is published at 125, Fleet Street.

ROSE SOUVENIR DE LA MALMAISON.—This old Bourbon Rose is presenting blooms this season of extra good quality. Owing no doubt to the continuance of warm bright weather, this being anything but a wet weather Rose, the blooms are perfect in form; and the colour, always admired, seems to be especially rich in its tint of pink or deep blush.—A.

SUPERLATIVE RASPBERRY.—Mr. George Bunyard sends us fruits of this variety, which, however, were shaken into a jam-like mass in transit, through the box not having been filled. We know the variety very well as a good grower and free bearer of fine fruits. It has been honoured with the first-class certificate of the Royal Horticultural Society.

YELLOW VIOLAS IN WINDOW BOXES.—These are very showy plants for the adornment of window boxes, growing as they do naturally all one way. The flowers form dense masses of colour, and if backed up with scarlet *Pelargoniums* an effective contrast is afforded. If the seed pods are kept picked off, and the plants freely supplied with water, they go on flowering all the summer.

DOUBLE PETUNIAS FOR BEDDING.—I lately saw a mass of these planted on a sloping bank; they were not more than 6 inches high, and though early in the season were freely covered with blooms varied in colour, very double, and most of them beautifully fringed. The plants were raised from seed sown early in the present year, therefore it does not appear necessary to take the trouble to winter a stock of plants and propagate from them in the spring to obtain a good display of bloom in summer.—M.

WE are requested to state that the next Show of the TAUNTON HORTICULTURAL AND FLORICULTURAL SOCIETY will be held, by permission of Dr. Kinglake, in the Vivary Park on the 15th August next. The old list has been carefully revised by the Committee, and several alterations made and new classes introduced. Good competition is expected, and one of the best provincial shows in the kingdom. Schedules may be obtained of the Hon. Sees., Messrs. H. Maynard and A. Hammett, at 5, Hammet Street, Taunton.

NICOTIANA AFFINIS IN POTS.—A correspondent writes:—"In one of the greenhouses attached to the Victoria Park, Portsmouth, a number of these plants in 4-inch pots are flowering, the spikes being about 2 feet long. Mr. Hatch, the gardener in charge, states the seed was sown at the end of February and the plants grown in gentle heat at first, and subsequently in cooler positions. They are very effective in the evening."

SEEDLING PINKS.—"In the borders of the Park are flowering some extremely neat Pinks raised from seed. Some are deeply fringed, others not so much so, and the colours are pleasing. Such plants are valuable for the margins of shrubbery borders, and few persons appear to know how easily they can be raised from seed and what a pleasing variety can be obtained in this manner."

FOXGLOVES.—A very fine sight is presented by a colony of the common Foxglove in one of the woods belonging to the Crown in

Hampshire. A piece of land, about 3 acres in extent, is thickly studded all over with spikes of bloom, many between 4 and 5 feet high, the flowering part at least 2 feet long. I never saw Foxgloves luxuriate as they do in the wood in question. The land is somewhat damp; the trees overhead are Oak, thinly planted; the undergrowth, which is mainly Hazel, was cut down about three years since, thus the Foxgloves have abundance of light, which adds to the freedom in which they grow.—E. M.

— FRUIT PROSPECTS FOR 1889-90.—All round hereabouts Apples and Pears appear to be plentiful. Owing to the heavy rains in May and the heat in June the trees pushed many young growths, but being checked by the subsequent heat and drought the growths are short and studded with b'ossom buds. A good spring in 1890, together with the absence of the devastating caterpillars, which the birds appear to have cleared, a heavy crop may be expected. The cold spring prevented early nesting amongst the birds, hence the caterpillars wrought the mischief before the nestlings were forward. The hedge sparrow is the gardener's friend, but the law is not strict enough for its preservation.—W. T., *Blantyre*.

— THE WEATHER IN JUNE.—W. H. Divers, Ketton Hall, Stamford, writes—"A few days, from 6th to 11th, were showery and dull; the remainder of the month was bright and beautiful summer weather. The 5th was the only clear day, but the 26th and 27th were clear for the greater part. Wind was in an easterly direction twenty-one days. Total rainfall, 0.73 inch, which fell on eight days, 0.35 of which fell early on the morning of the 7th, with a heavy thunderstorm. Barometer steady. Highest 30.50 at 9 A.M. on the 5th; lowest 29.72 at noon on the 2nd. Highest shade temperature 83° on the 2nd; lowest 43° on the 16th; Lowest on grass 41° on the 1st, 16th, and 18th. Garden spring running 30 gallons per minute on the 30th."

— THE NAMES AND SYNONYMS OF BRITISH PLANTS, by Geoffrey Egerton Warburton, B.A., is a pocket volume that will find favour with the British botanist. It is stated to be an attempt to make the difficulties of botanical nomenclature somewhat less, whilst it may at the same time point out what perplexing confusion exists, not only in the names given to various plants, but also in the rank they should take as species, sub-species, or varieties. The list contains the names of every plant considered as a species by the best authorities. Mr. Warburton has done his work faithfully and efficiently, and we highly commend it to British botanists. It is published by Messrs. George Bell & Sons. If we could only induce publishers to place the titles on the backs of all their books what a convenience it would be!

— REFERRING to the FINE SUMMER, the *Standard* says:—"If it has been a good season, so far, for the farmer and the husbandman, it has been equally kindly and favourable to the horticulturist and the private owners of gardens. If people complain that anything has failed in their gardens this year they may depend on it that—leaving out of account the ravages wrought by the caterpillars in the spring—the fault lies with themselves, or at any rate with those they employ. Just as everybody was beginning to say, 'We shall want rain shortly,' down it came; and, most obligingly, a considerable proportion of it has fallen during the night time. Perhaps we ought to allow, in order to be strictly accurate, that people who are very fond of their Roses would willingly have waited another week before the dry weather broke. But though the rain may have slightly shortened the heyday of the first bloom of the Roses, it will greatly benefit the second bloom. You cannot have it all round, as the phrase is. Without the rain the Phloxes, that will soon be in beauty, would have turned brown at the bottom of the long stalks, and everybody who has a garden of his own and watches it lovingly knows what that means. The Sunflower during the last few days has been growing almost with the rapidity of the Prophet's Gourd. How precious, too, has been the rain to the growth of the Rhododendrons, preparing them thus to do their duty next year. Nor must we forget more homely, but not less necessary, accompaniments of an agreeable life. The rain that dashed the Roses and finished the Foxglove has swelled the Gooseberries, ripened the Raspberries, and prolonged the Strawberry season. The dripping July clouds lay the dust and fill the larder. The gentle downfall has washed the honeydew off the Green Gages, plumped out the Peaches and the Nectarines, and would have developed the Apples had there been any to develop. But, alas! it will be, in most places, a bad Apple year. The wood ripened imperfectly last autumn, and the blossom, though fair to see at the time, has not fulfilled the promise of May."

— WOLVERHAMPTON SHOW.—At the great Horticultural Show which opened at Wolverhampton on Tuesday the following are a few of the leading prizes awarded, and a full report of the Show will appear next week. Sixteen stove and greenhouse plants (open), not less than eighteen in bloom.—First, Mr. Cypher, Cheltenham. Second, J. Marriott, Esq., Coventry. Mr. Cypher was also first for six exotic Ferns, six plants in flower, and six Palms. For a group of plants in 140 square feet and 100 square feet Mr. W. H. Dyer, gardener to Mrs. Marigold, Edgbaston, Birmingham, was the chief prizewinner. For forty-eight Roses (open).—First, Messrs. Cranston & Co. Second, Messrs. Harkness & Sons. Thirty-six Roses (open).—First, Messrs. Perkins & Sons, Coventry. Second, Messrs. Cranston & Co. Third, Messrs. Harkness & Sons. Twenty-four Roses (open).—First, Messrs. Perkins and Sons. Second, Messrs. Cranston & Co. Third, Messrs. Dicksons, Limited. Twelve dark Roses (one sort).—First, Messrs. Cranston & Co., with Alfred Colomb. Second, Dicksons, Limited, with Horace Vernet. Twelve light Roses (one sort).—First Messrs. Cranston and Co., with La France. Second, Messrs. Dickson & Co., with Merveille de Lyon. The Mayor's prize of five guineas for the most meritorious exhibit in the Show, was awarded to Mr. Cypher, Cheltenham.

— PLUMS IN FRANCE.—Plums constitute a produce of great importance, and it may be interesting to point out the extent of their culture in France. In the first place comes Lot-et-Garonne with 175,000 cwt., valued at 12,000,000 francs. The fruits of this country are very much prized. Next comes the Deux-Sèvres, supplying 98,960 cwt., worth 2,000,000 francs. The production of the Loiret is about 53,500 cwt., valued at 270,000 francs. That of the two departments of Aisne and Seine-et-Marne amounts to about 40,000 cwt. The 37,000 cwt. of Seine-et-Oise have a value of 48,000 francs, the production of Meurthe-et-Moselle amounts to 34,000 cwt., and it varies from 24,000 to 14,000 cwt. for the departments of the Aube, Haute-Saône, Meuse, Vosges, Tarn-et-Garonne, Haute Marne, and Seine-Inférieure. These figures relate to the year 1885. The total of the harvest in France has risen to 752,000 cwt. Moreover, as the quality of the fruit varies considerably, the variations in price are also great. The price of the hundredweight, which was 68 francs in Lot-et-Garonne, was only 20 francs in the Deux-Sèvres, from 42 francs in the Tarn-et-Garonne, and in fine from 4 francs 50 cents for the Haute Loire. There is certainly the material for supplying a considerable commerce.—(*La Nature*, June 29th, 1889.)

— NOTTS HORTICULTURAL AND BOTANICAL SOCIETY.—The usual monthly meeting of the Nottinghamshire Horticultural and Botanical Society was held at the Arboretum Rooms, Nottingham, on Thursday evening last week, when a large number of members attended. In addition to money prizes being offered to any meritorious exhibits by the Society, Messrs. R. Sankey & Son of Bulwell Potteries, Nottingham, who take a great interest in the Society, offered special prizes for the best six Coleuses, the best six Gloxinias, and the best six exotic Ferns, which caused a healthy competition in each of the classes. The exhibits were tastefully arranged in the large corridor, and during the evening about 2000 of the general public were admitted free. In the class for six exotic Ferns C. J. Cox, Esq., Basford (gardener, Mr. Meadows), carried off the principal honour; W. H. Farmer, Esq., Alexandra Park (gardener, Mr. Attenborough), being second. The class for six Coleuses were well represented, Mr. W. H. Farmer being first with well-coloured examples, the Sheriff of Nottingham, John Robinson, Esq. (gardener, Mr. Plumb), being a good second. Gloxinias were well shown, seven good lots being staged, the principal honours falling to Mr. T. Hallam, Dr. Powell, and Mr. James Booth respectively. Amongst those who sent plants and flowers, not for competition, but which received the Society's awards, were C. J. Cox, Esq., who staged a large and nicely arranged miscellaneous collection of stove and greenhouse plants, Orchids, &c. W. H. Farmer, Esq., sent a massive *Cyathea dealbata*, and a collection of stove and greenhouse cut flowers. Messrs. J. R. Pearson & Sons, Chilwell Nurseries, set up a large and varied collection of herbaceous flowers. J. Wesley Lewes, Esq., Hardwick House, Nottingham (gardener, Mr. Walker), contributed a fine collection of cut Gloxinia flowers. Mr. C. J. Mee, Wollaton Hall Gardens, an excellent collection of fruit and vegetables, very noticeable amongst which were some well-grown Muscat of Alexandria Grapes, highly coloured Peaches, and several varieties of splendidly well-kept Apples. Dr. Powell showed a magnificent dish of Strawberries (James Veitch), which received the Society's certificate of merit. Mr. Frank Yates, seedsman, Nottingham, sent handsome examples of his new Lettuce, Yates' Champion, which received a large share of attention from the visitors. The meeting in every respect was

a most successful one, and Mr. Steward, the indefatigable Secretary, is to be congratulated upon the able manner in which he carried out the arrangement of the Show.—J. H. W.

RASPBERRY HORNET.

AS was stated in the report of the Royal Horticultural Society's meetings last week, the Fruit Committee inspected several varieties of Raspberries established in the gardens at Chiswick, and unanimously recommended that a first-class certificate be awarded for the variety under notice. It arrested attention by its free growth and large clusters of fruit—in these respects surpassing Prince of Wales and others growing in the same square. The fruits are large, somewhat pointed, pale red in colour, and very firm. A cluster is represented in the engraving. The variety, it appears, was obtained in France many years ago by the late Mr. Rivers; and although it has always been regarded as the best

to trace debility which puzzled me in one or two instances to root disturbance to these industrious and insignificant looking creatures. It seems to me that the nests of the ants are not to be detected by any elevation in the ground. One can only discover them accidentally; at least this has been my experience.

Notwithstanding the dry weather, Roses which have been carefully syringed and duly watered are making an excellent display. I have never enjoyed mine more either in form or colour, and the size has been equal if not above the average.—A. M. B.

SYRINGING VINES.

I DO not think this practice is so common now as it was at one time. "Syringe daily from the time the Grapes are formed until they begin to colour," is advice I find general in Vine growing instructions twenty and thirty years ago. Now it is, "If you want to have the bloom perfect do not syringe after the Grapes are thinned," and the question is, Which practice is the more beneficial? I am in favour of syringing.

FIG. 6.—RASPBERRY HORNET.

variety at Sawbridgeworth it has not been pushed into notice but sold with others in the ordinary course of trade. Judging by the well-established plants at Chiswick this Raspberry is a good grower, bearer, and traveller, qualities that entitle it to be regarded as useful for general cultivation.

ANTS AND ANEMONE FULGENS.

I HAD possessed for several years a well-established clump of *Anemone fulgens*, but this spring I counted in vain on its graceful foliage and brilliant blossoms. The foliage came up weak and thin. At last it was represented by a solitary leaf, flower buds there were none. One day last week, on digging for a root or two with a view to investigation, I discovered that the ground which should have been as usual represented by *Anemones*, was entirely occupied by the nests of the small red ant, all traces even of the roots of the *Anemones* having vanished.

I have found many similar nests in my garden, and am inclined to think that the small red ant and the small black ant are both equally noxious neighbours, and must do much mischief burrowing amongst the roots of flowers and of Roses. At least I am now with certainty able

I know syringing will tarnish the bloom a little in some cases, but if syringing is done with water free from all impurities it is astonishing the small impression it will make on the Grapes even if syringed up to the time they begin colouring. Tarnishing the bloom is the only harm that syringing can do to Grapes, while the benefits derived from it are clean healthy Vines, and a satisfactory exemption from all insect pests.

It is well known that thrips, red spider, and green fly abhor water, and the free use of it on any plants will invariably prevent their gaining a footing, or if they have already done so it will annihilate them; and what is of equal importance, mealy bug cannot resist the application of the syringe. I do not say that to begin syringing Vines when they are well stocked with mealy bug would cause the pest to quickly disappear, but I assert that if Vines on which mealy bug is known to exist are syringed from the time they are started into growth until the fruit commences colouring the bug will be almost invisible the whole time, and after syringing is discontinued it will fail to make any headway or increase to an objectionable extent. After trying every known remedy for this pest I would sooner depend on the hydropathic treatment to stay its injurious progress than anything else.

There are, however, various ways of syringing, and some do more harm with it than others. We have seen those using the syringe apply the water with such force as to make every berry in the bunches

shake, and by degrees the leaves become ragged and cut round the edge. This system is a mistake, as it injures the Grapes and leaves, and does not keep the insects so much in subjection as a gentle but thorough saturation of all parts of the Vine.—A KITCHEN GARDENER.

NOTES ON EARLY ENGLISH HORTICULTURE.

(Continued from page 433, last vol.)

THE street cry of "Cowcubmers," very familiar to all dwellers in towns, carries us back nearly three centuries, when the name was not only pronounced thus, but written to correspond, which seems to throw a doubt upon its derivation from the Latin *curvus*, because its fruits are apt to be crooked, as some old authors say. In order to get straight Cucumbers they used in the seventeenth century to put the fruit while small, into a long tube (presumably of paper or wood), by which means they lengthened it and kept it from curving. Gerarde, in 1596, had announced that a Cucumber plant having been taught by art to produce straight fruit, might be expected to prove the parent of plants which would not need their fruit treated in this way. Another old gardener found fault with the Cucumber because it was of too moist a nature, and he advised that the pits in which it was grown should be partly filled with absorbents, such as chaff or chips, to make the plant grow drier. These early pits were only covered with mats stretched over hoops. Forcing under glass does not seem to have been successfully carried out till the reign of George I., when Fowler of Stoke Newington astonished the world by producing fine Cucumbers on New Year's Day, 1721. Stimulating the growth of plants by the application of dung or other manure is a practice so old in England that its commencement cannot be dated; but no attempt at forcing plants by greenhouses or stoves seems to have been made till about the middle of the seventeenth century, but there were a number in use a few years after the Restoration.

The list of Cromwell's actions is not complete if we omit that he took an interest in gardening and agriculture, as also did several of the leading men amongst the Puritans. It was one of the singular incidents of the notable year 1649 that a sect arose whose doctrine it was that the majority of mankind ought to betake themselves to the primitive pursuit of cultivating the ground, and a number of them set to work near Cobham, Surrey, planting roots and sowing Beans on waste land; but seeing their views tended to a dangerous socialism the Council of State had to disperse them, and the new scheme collapsed. Samuel Hartlib, author of several tracts on husbandry and editor of one written by an aged clergyman whose name is unknown, in which the extensive planting of fruit trees was earnestly advised, was one of the Protector's friends. During the Commonwealth he received a pension of £100 yearly, and this tract in particular led to the formation of orchards in many English counties. Some consider that the important Apple orchards of the Midlands had their origin at this period. Hartlib had amongst his friends the clever but unfortunate man Plottes, of whom little is known, except that he died in a London street by want of food. His quarto book, the "Art of Planting, Grafting, and Gardening, with a Perfect Platform of a Hop Garden," printed about 1640, contained much valuable matter; probably it was not much read owing to the near approach of the Civil War. In 1654 he published his "Expert Gardener," a curious book with illustrations, but compiled from continental works. It had a good effect on both gardening and agriculture, especially by its explanation of Flemish methods. He had been preceded, however, in this work by Sir R. Weston, who had brought out some ten years before a pamphlet on the pursuit of husbandry in Brabant and Flanders, as it had fallen under his own observation. Our English gardeners of that century were, it appears, lacking in method and in perseverance. One valuable practice he originated was the cutting of green crops for fodder, which had not before been thought of in this island.

The two Tradescants, father and son, are closely connected with the progress of horticulture in the seventeenth century, as introducers of many exotic species; also they were the possessors of a memorable garden at South Lambeth, part of the site of which is now occupied by a brewery of large repute. An old house called, I believe, Turret House, only removed a few years since, was said to have been once the abode of the Tradescants, or "Tradescins," as their neighbours perverted the name. A succession of authors have persistently asserted that the elder Tradescant was a Dutch emigrant, but recent inquiry establishes the fact that this is an error, as he was of English parentage. John Tradescant is stated to have been, when a young man, gardener to Lord Treasurer Earl Salisbury; subsequently he became a traveller, searching for rare plants. His first explorations were in some of the cold regions of Russia; afterwards he visited the Mediterranean Isles and some places in North Africa. In 1629 he was appointed gardener to Charles I. The post, however, seems to have been honorary, as

was probably Parkinson's also, who was styled the king's herbalist. It was during the reign of this king that Lambeth, which had till then retained its natural wildness, and the marshes of which yielded a variety of plants to the herbalists, began to pass into the hands of the gardeners. Asparagus had no doubt been cultivated for many years before Gerarde's time, for he speaks of it as no novelty, and observes that the native plant could be so improved as to almost equal those imported from abroad; but the 'Sparagus Garden at Lambeth is the first locality with which this vegetable is distinctly associated. Somewhere near, between that place and Vauxhall, Melons also were freely grown on the moist soil, and the elder Tradescant, who had no doubt frequently rowed across from Westminster to Lambeth, chose out a spot on the higher ground for what became a renowned experimental garden. Here the Scarlet Runner was first grown in England, the seeds having been brought from South America in 1633. Its flowers were used for nosegays, and the plant itself only regarded as an ornamental trailer, till Miller, in the next century, showed that the pods might be advantageously cooked and eaten. Yet the gardeners who preceded Miller knew this was a species of Bean, and it has been supposed there was a superstitious prejudice against the pods as food because the blossom is blood-coloured. But the good folk of two or three centuries ago had some curious theories; thus, for instance, one of the earliest named varieties of the Pear which was grown about London, the Warden, was reputed to be "good to quench choler." Hence, as a modern author remarks, a present of a basket of these to a friend might be really valuable if the Pears acted on the mind through the body and convey besides a delicate hint.

There seems to be a doubt whether the Apricots brought from Algeria by Tradescant, sen., were a new variety merely, or the first samples of the fruit known in England; probably it had been introduced before. Both father and son obtained seeds and slips by their own researches and the help of friends, which made the South Lambeth garden so rich in new plants that a catalogue of these was printed by Tradescant, jun., for the benefit of gardeners and botanists. A genus of plants in the Spiderwort group is named after the Tradescants, and an Aster which was introduced by one of them. It has been asserted that Tradescant, jun., was the man who obtained the first exotic Ferns when he visited Virginia in 1628. The species he brought are said to have been *Adiantum pedatum* and *Cystopteris bulbifera*. During the time of the Tradescants there were plantations of Vines and Hops at Lambeth, of which a memory yet lingers in local names. After the death of Tradescant, jun., a poetic epitaph was put up to the honour of both, in which allusion is made to them as cultivators of the Lily and the Rose. Nearly a hundred years later a deputation from the Royal Society went to investigate Tradescant's old garden, and discovered some descendants from the plants which he had been the means of introducing to English cultivators.—J. R. S. C.

ROYAL BOTANIC SOCIETY.

FLORAL FÊTE, JULY 15TH.

To celebrate the Jubilee of the Royal Botanic Society's existence the Council some time ago decided to provide its Fellows and the public with an attraction of a novel character, and quite a departure from the conventional exhibitions with which all are now so familiar. Borrowing an idea or two from continental celebrations, such as the battle of flowers at Nice and similar events, it was resolved to hold a "Floral Parade and Feast of Roses" in the Botanic Gardens at Regent's Park, at which medals and prizes would be offered for carriages and other conveyances, horses, and ponies most tastefully decorated with flowers; also for wreaths, garlands, arches, with groups and baskets of Roses. The latter portion of the exhibits were placed in the large marquee; but the carriages, &c., were in the gardens, and despite occasional showers the weather proved fine enough to enable the "parade" to be seen to good advantage.

An extremely large and fashionable company assembled in the afternoon, and by 5 P.M., when the Royal party arrived, consisting of the Prince and Princess of Wales, with their daughters, the Duke and Duchess of Teck, Princess Victoria of Teck, Prince Christian, and the Earl of Fife, there was a dense crowd of visitors on both sides of the broad walk from the conservatory to the entrance. A parade had taken place earlier in the day, but the principal event was that at five o'clock, though many who had not secured places had to be contented with a very imperfect view of the procession. Considerable difference was manifested in the style of decoration adopted and the taste displayed, but several charming carriages and chaises were shown, Mrs. E. Ledger taking the chief honours (the Princess of Wales's prize, value twenty guineas, and the Royal Botanic Society's gold medal) for a bright and effective decoration, in which yellow and orange flowers predominated, Coreopsis and African Marigolds furnishing the prevailing tints. N. Sherwood, Esq., had (first prize) a small phaeton or chaise liberally adorned with Roses and other flowers; and C. Sharman, Esq., contributed a similar vehicle, driven by one of his daughters, which attracted much notice, and received second prize. Mr. J. Chard had a

small conveyance adorned with Marguerites and Poppies, other competitors being Mrs. and Miss Gilbey, Miss Ada Bell, Mrs. Bryant, and Mr. W. Goldsmith. In one case La France Roses were employed almost exclusively and with good effect, while in most instances Roses were used for the wheels, giving them quite a kaleidoscopic appearance as the carriages were driven past at a smart pace. Few horses or ponies were sent, but most of these were tastefully adorned with flowers in wreaths and chains. Upon the lake were one or two boats florally decorated, but most of the other outdoor productions were very unsatisfactory.

Within the great marquee the groups of Roses from Messrs. W. Paul and Son, Waltham Cross, which were arranged on the five central banks in graceful scrolls, bands, and beds, the colours contrasting or harmonising charmingly, were the chief feature. Large numbers of blooms were employed, and the style adopted was a most welcome attempt to break away from the monotonous exhibition methods generally adopted. A large gold medal was awarded. Messrs. Keynes, Williams & Co., Salisbury, also had a pleasing contribution in the shape of a Rose bower, consisting of two arches, crossing at the apex, and with a central column, Reynolds Hole and Niphetos Roses being chiefly employed with admirable effect. Extensive groups of Rose blooms were shown by Messrs. Rumsey and Frank Cant, and it was a surprise to many to see such fresh substantial flowers thus late in so trying a season. There were not many baskets of Roses arranged for effect, and these were nearly all too heavy, the best being one containing La France Roses and Cissus discolor sprays from Mrs. M. H. White (silver medal).

Of miscellaneous groups and collections a group of Tuberous Begonias, Ferns, and Palms from Messrs. Laing & Co., Forest Hill, was one of the most tasteful. This firm have proved abundantly how well these Begonias can be grouped if a little care and thought are exercised. A central basket of the handsome drooping single variety pendula was most telling. Groups of Orchids came from Mr. B. S. Williams, Upper Holloway (silver medal), and Messrs. Low & Co., Clapton (bronze medal); Crotons from Mr. Offer, Roses and Poppies from Mr. R. Miller, of Shoreham; Ferns from Mr. H. B. May (silver medal); and Gloxinias from Mr. W. Grundy (silver medal); so that the marquee was well furnished.

In response to the invitation of the Secretary the majority of the lady visitors wore Rose wreaths and sprays, and there must have been a heavy demand for flowers that morning, and some of the florists had been busily employed in furnishing so many thousands of tasteful productions.

TABLE PLANTS AND GLOXINIAS.

Two short papers on the above subjects were read by Messrs. Tranter and Collier at the last meeting of the Sheffield Floral and Horticultural Society. The following are some notes of both papers:—

TABLE PLANTS.

Tastes differ in the selection of plants for table decoration. Among the best for this purpose are small Palms, and it is generally admitted that the lightest and most elegant in growth are the most suitable. Palms are raised from seed, and can be bought of any required size from nurserymen. Other suitable plants for tables are Crotons, Dracenas, Aralias, and Pandanus, all of which strike readily from cuttings. Plants of the two former that are too large for the tables may be cut down and the tops inserted in a mixture of light loam, leaf mould, and sand, and placed in a propagating case in a stove, keeping them close for two or three weeks and sprinkling occasionally. When the old plants have thrown out side shoots sufficiently long these may be taken off and treated in the same way as the larger cuttings. The best time for propagating Dracenas and Crotons is May or June. It is of great importance to never place table plants in too large pots; 6-inch are large enough, and with the aid of a little liquid manure the plants may be grown of the size required. The narrow-leaved Dracenas are the best, and in all cases they should be confined to a single stem; anything approaching a bushy habit renders them too heavy.

Pandanus are increased chiefly from side shoots, which the plants produce very freely, particularly when kept well syringed. Good varieties of table plants are Pandanus Veitchii; Crotons Lord Wolseley, Warreni, and aigburthensis; Dracena terminalis; Aralias regina and Veitchii. Plants suitable for amateurs who have only a cool greenhouse are Grevillea robusta and Aspidistras. The Aspidistra is one of the best of room plants, the foliage remaining in good condition in a dry atmosphere. It does well in ordinary loam, and is increased by division of the roots. The Grevillea may be raised from seed, also from cuttings, but it is difficult to strike except in a strong bottom heat, such as that afforded by a hotbed.

GLOXINIAS.

Gloxinias rank among the finest of summer flowering plants. There is sufficient diversity of colour among them to suit almost everybody. They are very easy to grow, though not altogether amateurs' plants, for at all times they require heat. There are many ways of raising them—sowing seed, dividing old tubers, and striking the leaves. Seed should be sown in January to have plants in bloom the same year. Prepare a well-drained 6-inch pot, and fill it with fine sandy soil, having among it a little peat, also fine. As the seed is very small it should not be buried but sown on the surface, gently pressing it down with the bottom of a flower pot. In a moist atmosphere and a good bottom heat the seedlings will appear in about a fortnight. When ready to handle transfer them an inch apart into pans filled with light sandy loam and peat. Return them to a stove or early vinery, the latter being an excellent place. Do

not allow them to become drawn or they never make fine plants. When they have made four or five leaves pot in 60-size pots, and subsequently transfer to 5-inch, and with good culture they will make fine plants the first year. At all times they must be kept very near the glass, almost touching; and if gradually inured to the sun from the beginning it is astonishing what a great amount they will endure. I have grown plants suspended from the roof, and they have had a very pretty effect, particularly with drooping varieties. After blooming I usually place ours in a cool frame, gradually withholding water, then the old leaves soon change. I then place them out of doors, laying the pots on their sides in wet weather. The winter treatment during rest consists in housing them in any place free from much damp, but, on the other hand, it must not be too dry or the tubers will fail. Some shake them out of their pots and winter them in cocoa-nut fibre refuse, but I find no better plan than keeping them in the same pots they flowered in.

To have a succession start the first tubers in January, following at intervals to March or April. When the tubers have started into growth they should be shaken out of the old soil, and repotted in fresh in smaller sized pots. If increase of stock is desired large tubers may be divided, having a break to each portion of tuber detached. Another method of increase is by the leaves, which may be cut or nicked crossways on the under sides, and placed flat on any moist medium in a warm temperature. Tubers will develop from nearly every cut. The leaves may also be cut with a portion of stem attached, and rooted round the edges of pots like ordinary cuttings.

The Chairman (Mr. F. Hardy) remarked on the method of growing Gloxinias without shade, saying he had grown them close to the glass from beginning to end without any shade, and found that they did very well. This method also keeps the plants dwarf and sturdy, and the drooping varieties do not drop their blooms so soon as they generally do when grown in shade.

SHEFFIELD AND WEST RIDING CHRYSANTHEMUM SOCIETY.

THE quarterly meeting of the above Society was held at the Museum Hotel, Orchard Street, Sheffield, on Wednesday evening, July 10th. The chair was taken by Mr. J. G. Newsham, who opened one of the most successful and most numerous attended meetings ever held, by introducing to the members Mr. W. Tunnington of Liverpool, who was received with the greatest enthusiasm, and it may be safely said that never within the annals of Chrysanthemum growing in Sheffield was the visit of any authority on the cultivation of the flower more eagerly anticipated.

Mr. Tunnington, on rising, said he proposed dealing with the Chrysanthemum in many of its stages, and would therefore describe his paper in general terms as:—

ON CHRYSANTHEMUM CULTURE.

Mr. Tunnington proceeded: It will be remembered by most of you that I strongly advised cultivators, if possible, to avoid what is known as the May bud, and in order to accomplish this, I must direct your attention to the old stools after flowering, and the striking of the cuttings. This bud is due in most instances to not looking after the plants well between the time of flowering and the time the cuttings are ready for insertion. The stools should be carefully watered and kept near the glass in a cool structure where frost cannot reach them. This will induce the formation of strong cuttings that have the appearance of vigour about them. If striking is delayed until November or December for Japanese, and a few late flowering incurved (the principal batch of incurved to be inserted during January and February), I maintain that cuttings derive more benefit by being left on the old plant during the dark days of December and the early part of January than they do when inserted in pots stood in cold frames and "hang about" for weeks.

If the cuttings are placed in a gentle bottom heat, and never allowed to flag, they will root quickly and grow at once with freedom. One question should present itself to your mind, and that is, "Why avoid the May bud?" If stopping is recommended, that is a natural question, and one arising out of the foregoing remarks. For some time it presented to me some difficulties, which were only overcome by experience and observation. But to come to the question, "Why avoid this bud and then stop the plant?" Where is the difference? It is simply this: it is not merely wasting time, but the formation of the bud practically paralyses the plant for a time; this bud forces the laterals from every leaf down the stem of the plants, which checks the plant more than the removal of a small portion of the top. The formation of the bud causes the stems to harden more than I consider good for the well-being of the plants in this early stage of their growth.

CHANGE OF CUTTINGS.

There is another point of importance which influences this matter and one that should not be lost sight of—viz., a change of cuttings.

When plants are grown on what I call the high pressure system, for such it is, and blooms of exhibition quality are produced, the constitution of the plant is enfeebled, its whole energy is concentrated into the building up of wood and the development of a fine bloom. The result is that cuttings are in many cases very sparingly produced, and often then they are only of the most puny description. A change of cuttings is a decided advantage, not for the mere sake of a change, for no advantage would be gained by having cuttings from a friend who had subjected his plants to the same high-class cultivation. The cuttings obtained should be from plants that are grown for ordinary decoration, grown well, but not on the exhibition principle. Plants grown for decoration generally yield plenty of cuttings, and those if well looked after usually grow stronger and make better plants during the season than the weak cuttings that have often to be depended upon from plants that have been grown strongly for some years.

EARLY STRIKING—THE MAY BUD.

What advantage is gained by early striking is a question well worth the consideration of every grower, and one that must be duly considered if we are to get the right sort of bud at the proper time. If early striking possesses advantages of such importance as some growers maintain, I have failed to perceive them; but on the other hand I have been able to note the disadvantages that attend such a course of treatment. By early striking the cuttings are "hanging about," and their small stems gradually become hard, the result of this treatment being only too visible in May by the production of a flower bud. If the cutting is a good one to commence with, and the plants produce a bud in May, it is due to a check in some stage of growth. Cuttings propagated from plants that have been too long under what I have termed the "high pressure system of cultivation," show this bud generally towards the middle of May. I may say in passing that my plants, or at any rate a portion of them, are showing this year earlier than they usually do—namely, the first week in June, and from what I have seen with other cultivators the same sort of early bud formation is common with all. We do not apprehend much difficulty from this, as our plants are in good condition at the roots. Although it checks the plants for a time most probably these plants will not show another bud until August, or what I may term the proper time for securing the buds.

TAKING THE BUDS.

I do not care to take any before 20th August, except a few that are known to be late varieties. The plan we adopt is to take the points out of the plants when we observe too early bud formation taking place. In some cases three or four good breaks will be observed a few inches down the stem of the plants, and when this occurs we remove the top of the plants down to those breaks, which somewhat reduces the height of the plants. We have always topped some of the plants of the same family in May, and allowed others to grow in a natural way. This results in the buds being produced at different times. If cuttings have been rooted at the time advised, and grown without a check, those not stopped will usually grow on one stem till the middle of July. This is what we term the July bud. This bud is no use for producing flowers for exhibition. It is the growths that spring from the base of this bud that produce the best flowers. You will by this treatment—that is, topping some in May and allowing others to grow on in a natural way—have a better chance of getting the right timed bud. It is not unusual to see blooms produced by this topping process of quite a different character on the same plant. The cultivator is sure to hit the mark with some of them. Some will show a bud early in July. Those should have their shoots removed by degrees.

THE SECOND JOURNEY.

About the middle of the month the whole of these plants will require attention, as I have found this the best time to put them in what I will call their second journey. This is done by removing all the shoots that are not required to carry a flower; at the same time examine those that have not actually shown their buds. In some cases small growths will be showing from the axils of the leaves; any plants that show these laterals should have the point of the plant removed at once, as by so doing quite a fortnight will be saved. This is the time to throw all the vigour possible into the plant. If left to take its own course it would come too early on the one hand or too late to run on to get a bud other than a terminal, which is useless in the north for exhibition purposes unless the season proved an exceptionally fine one, whilst in the sunny south it would make a good bloom. If the plant is in good condition at its roots, and is well furnished with foliage, it will produce another crown bud, intermediate between the crown and the lateral. The leaves on the stem of this bud follow up so close to the flower that when expanded the guard petals rest upon the foliage. This is the bud I always find produces the bloom possessing all the qualities a first-class flower should have, and such as will make the cultivator's heart rejoice when he comes to cut the flower. I have adopted this plan for years, and have always found it a good one. This especially applies to the incurved section; at the same time I may name some of the Japanese that can be got to the proper time better by this stopping process—viz., R. Broeklebank, Meg Merrilies, Boule d'Or, Yellow Dragon, Val d'Andorre, Gloriosum, Belle Paule, Grandiflorum, Fair Maid of Guernsey, Baron de Prailly, Triomphe de la Rue des Châlets, and many others. If those plants are pinched at intervals from the middle of May until the middle of June there will be less difficulty in securing a bud that will expand with freedom; if not

topped they are liable to show too early, and only produce coarse hard-centred buds. If this bud should prove worthless the shoot on which it was produced is lost, as the next bud will be too late to be of any service. It has long been understood that Eve and Mabel Ward require topping to get them to produce a bud at the proper time, which is quite true, but I go further than this, and top some of each variety that we grow.

AUGUST BUDS.

Some plants will show buds too early in August. In this case you must use a little judgment. We allow the small growths that spring from the base of the bud to extend for a time. They must not, however, be allowed to grow to the extent of robbing the bud too much, or you will lose it, but pinch one part of a shoot one day and so on just sufficient to ease the bud. I am now speaking of the top shoots. Those lower down the stem can be left to take care of themselves until you can perceive the bud swelling, and it has attained the size of a large pea; even then do not remove all the shoots at once, but by degrees. There is another matter worth noticing in some of the strong growing Japanese, especially when they show rather early. A strap leaf will appear on the stem of the bud; this leaf will sometimes grow to the extent of robbing the bud so much as to spoil it, therefore this leaf should be gradually removed. Another little matter: as soon as we have secured the bud we supply (once or twice a week if the weather is hot) some tobacco powder from a puff to the points and buds of the plants, I think this a great preventive against the attack of yellow thrips, which are always lurking about at this time, and often destroy the bud whilst in an embryo state. This cannot readily be perceived at the time, but it is too often the cause of deformed flowers when the blooms expand.

FEEDING THE PLANTS.

When last with you I omitted one important ingredient from the compost I advised you to use—viz., charcoal. That sold by nurserymen is excellent, but for years we have been in the habit of preparing our own from the refuse that remains after the Pea stakes are dressed, the branches that blow from trees, and any prunings that we are able to collect; a 10-inch potful of this is used to each barrowful of soil. This keeps the soil open and in a healthy condition, an important matter if the plants are to root with freedom. If a sound compost is used very little feeding will be needed before the close of June; in fact, up to the 20th no feeding has been done. We then commence giving the plants weak liquid manure once a week from the farmyard.

TOP-DRESSING.

At the end of the first week in July we top-dress the plants by filling up the space that was left in the pots when the plants were placed in their flowering size. The material we use is the same that I advise for the first potting. Feeding by the aid of liquid should be discontinued for a fortnight or so, while the roots take possession of the new soil. We again top-dress in September, and this time we have to exceed the limit of the pots. The pots are filled level full of soil, the same as we use for potting. We then get about a bushel of fresh cowdung, and add to this a peck of night soil, or the same quantity of fowls' or pigeons' dung, and as much dry soil as will, when well mixed together, make the whole about the consistency of mortar. We then get two old bricklayers' trowels—large knives will do just as well—and commence to form a rim on the outer edge of the pot, and about an inch or so on the soil inside the pot. The rim will then be 1½ inch or a little more through, and if it is made about 1½ inch high, will hold sufficient water for the plant. It is not only necessary to enable the cultivator to water the plants properly, but it is also acts as a good stimulant to them, for the water and autumn rains carry down to the roots the fertilising ingredients that it contains. Feeding by the aid of liquid from the farmyard should be carried out carefully and judiciously, as very often autumn rains keep the soil too wet for the well-being of the plants, and applications of liquid cannot be given them without adding to the evil over which we have no control. By rich top-dressings the plants are largely independent of the water pot. I think I told you in autumn last how valuable I had found the liquid from an undrained closet. This we use at intervals of two or three days. For instance, we water with liquid from the farm, then give clear water for two days, then resort to that from the closet, when the next application is required. Another good liquid, and one that the Chrysanthemum enjoys, is made from the following: A bushel of cow or sheep manure and one peck each of soot and lime, mixed together, tied up in a sack and placed in a hogshead of rain water. If the bag is squeezed and knocked about in the tank the liquid will be fit for use in about two days, and it should be diluted with three parts of water, increasing the quantity of liquid as it becomes necessary to fill up the tub. Hen and pigeon manure tied up in the same way make an excellent stimulant.

SOOT AND CHEMICAL MANURES.

During wet weather, when stimulants in the form of liquid cannot be administered without the risk of saturating the soil, soot may be sprinkled on the surface. It acts quickly, and imparts to the foliage a fine dark hue. We have tried the majority of artificial manures that are sold in the market, such as Clay's, Beeson's, Standen's, Amies', and Thompson's; perhaps the last is as good as any of them. We apply these on the same principle as the soot during showery weather, and no doubt occasional applications of these patent manures, used with care, promote activity at the roots. At the same time I wish it to be under-

stood that if the weather should be hot and dry instead of showery, we prefer using the liquids previously named, as they are of a cooler nature.

Sulphate of ammonia and nitrate of soda are very dangerous, and should be applied with considerable caution. Any plant that is late, or has been topped late, will be pushed forward quickly if a pinch is given on the surface whilst raining—that is, if the cultivator has no better method of using it. I prefer putting a 6-inch potful into the hogshead when the other liquid is getting weak, and it is quite safe used in this manner. I continue using liquids until the blooms are cut, discontinuing only for a short time when the plants are first housed.

The tops of the pots will be found to be a complete network of white healthy roots to the last, but strong stimulants in the last stages of growth should not be given—in fact, in no stage of growth, as it is much better to apply them weak and more frequently, as the plants derive more benefit than from occasional strong doses, and there is no risk of injurious results following. My advice on feeding the Chrysanthemum is to keep on the safe side, for over-feeding will bring the plant to a standstill for a long time, a quantity of the lower foliage will fail, and it is a question if the cultivator can get the plants right again during the season.

SYRINGING.

Another matter we practise is syringing the plants three or four times a day during hot weather; in the morning about ten, and again at noon, and often twice afterwards, and I am certain that the plants enjoy this treatment, for they are impatient of the burning sun and hot dry air, especially after a few dull days. This frequent syringing prevents the plants showing signs of distress, which they would quickly do by the enormous evaporation taking place from their stems and leaves.

WOOD RIPENING.

I do not think this of much importance. If there is such a thing as wood ripening I should be glad to know how it is done. All I have found necessary is to let the sun and light reach the stems of the plants on all sides. If we are to place such importance on this ripening process how do the trained plants that are grown about Liverpool produce such fine blooms when they are trained half-cone shape, and the foliage completely covering the stems of the plants throughout the season? yet those plants produce blooms of such excellence that would do good service on first class stands. How does the wood ripening in this case come about? For my part I fail to see it. I have been convinced for a long time that the secret lies in taking the bud at the proper time, and leaving the ripening to take care of itself.

SECURING THE PLANTS.

I advise one stake to be placed to each pot, the shoots to be slung to this and allowed to sway loose, and also a line of tar twine to be strained to posts (the height at which the line is to be placed can be judged according to the variety), higher in the middle of the row, and sloping down to each end. When the growths have reached 6 or 8 inches above the line they should all be tied at equal distances to it, which is much better than tying them to laths as some cultivators recommend. If the shoots should grow to the extent of needing further support they should again be slung to the stake above the line. I find this simple way of securing the plants handy at the time of housing, as the line can be cut, and as all shoots are secured to the stakes the plants can be quickly moved.

MILDEW.

If mildew has attacked the plants, which is often the case at this time, they should be laid on the ground and thoroughly syringed on the under side of the foliage with the following mixture:—A 3-inch potful of sulphur placed in a four-gallon can of rain water, and two wineglasses full of lemon oil, or a piece of soft soap about the size of a walnut. If the soap is boiled for ten minutes with about a quart of tobacco water so much the better.

HOUSING THE PLANTS.

In placing the plants in the house we select those most advanced and place them at one end, where shade can be given if the weather should be bright, and the late ones in a house where heat can be applied if it should be needed. When the plants are accustomed to their new quarters the whole should be fumigated with tobacco smoke, for it is very difficult to destroy green fly when they establish themselves in the base of the petals. I have observed the plants "sulk" after housing, owing to the loss of night dews to which they have been accustomed outside, so we give all the air possible, and syringe the plants two or three times a day according to the weather. Feeding is also stopped for a few days. It will be noticed that the plants come to a standstill for a short time. It is therefore best to keep the foliage damp, and to let them have pretty well their own way for a few days.

BLOOMS DAMPING.

This is a most perplexing thing, and one that will not be readily fathomed. I have often heard it attributed to over-feeding, but I fail to see how this comes about. Over-feeding practically paralyses the roots of the plants, and they cease to convey to the bloom the food necessary to develop it. This is often the cause of a bloom half expanding, and then refusing to fill up in the centre. I have for the purpose of over-feeding or gorging, if I may be permitted to term it, set plants apart for this purpose. The first effect is the lower leaves curling and turning brown at the points, and in the end they decay

and fall off. The flower will throw out a row or two of petals, but will never expand. If the damping evil is caused from the roots, how is it that a plant with three or four flowers on it, one will damp and the others not? I attribute damping to the gases that are carried in the air in foggy and damp weather which settle upon the petals. The evil is done when two or three dull days are followed by the sun shining bright for an hour or so. I have observed it is always after this kind of weather that we lose our flowers; rarely, if ever, have I experienced damping if the weather is at all frosty.

No doubt some of you will have had some experience in using stable manure. When used too fresh and highly charged with ammonia in a Peach house when the trees are in flower, the bloom is destroyed and not a fruit will set. Again, if used in a house where Adiantum Ferns are growing, if the house is closed all the young fronds will be destroyed in one night, and I do not see why the same sort of thing should not take place in the flower of the Chrysanthemum; and if sulphate of ammonia be sprinkled on the surface of the pot, and watered in, and the house closed, you will have the house reeking with ammonia, and this is no doubt one great cause of the evil, as the ammonia condensing on the petals of the flowers will be only too visible the first sunny day by holes being burnt in them. I am of opinion that if this damping is caused from the roots the petals would be affected at one end or the other, and not in the middle. I think we shall have to look to atmospheric influences rather than blame the Chrysanthemum for being such a gluttonous plant as to destroy its own flower through over-feeding. To illustrate what I have said regarding atmospheric influences, I once had a number of plants fully expanded in an outhouse, the door was opened to show some visitors the flowers, although only for a short time; the result was in a few days all the flowers at the front were lost. It has, therefore, since been my practice to give no more air than is necessary during damp weather, and to have just sufficient heat in the pipes to keep the air in circulation—the temperature between 40° and 50°; 5° or 10° more may be given for a short time to bring up those plants that are late, but it is not well to subject the opening flowers to too much heat for long, or it will spoil the colour and cause the petals to reflex. Plants that have the flowers fully expanded, and it is desirable to keep them for a short time, may with safety be placed in a dark dry outhouse.

In conclusion, it is better to be a little early than late at show time, remembering that the bloom can be kept for a time either cut or on the plants. I often see flowers staged at some northern shows before the centre is grown out, which greatly reduces the blooms in height and sadly militates against the exhibitor's chance of success.

Mr. Tunnington was, on the motion of Mr. Newsham, seconded by Mr. Ledger, and supported by Messrs. Eadon, Jarvis, and cordially thanked for his paper, the several speakers pointing out how especially valuable were the speaker's remarks, from first to last the interest in them being thoroughly sustained.

GOOD HARDY FLOWERS.

It may be of more than passing interest to some at least of your readers to know which are the most useful and showy plants used in flower in the hardy herbaceous beds and borders, but as these are far too numerous to give in detail I will merely cite the best for general decorative purposes.

POLEMONIUM RICHARDSONI.

For some time past this has been sending forth its second crop of flowers this year; nor does even this exhaust its flowering, for when this is over a third will soon appear, a fact alone which should render it extremely popular. It dies nearly to the ground annually, but commences growing early in spring, and soon the lovely azure blue spikes of flowers are produced. These in the first flowering are usually not more than 10 inches high, and while these are on the wane another batch may be seen springing up, and these usually attain to 18 inches high, the flowers assuming an exquisite shade of sky blue of a much lighter tone than in the first flowering, the increased sunlight having probably something to do with this change. The plant is readily increased by division at any time when not flowering, preferably after the first spikes fade.

GAILLARDIAS.

These are now in their fullest beauty, and are quite unique in the rich colouring and variety of their flowers. Perfectly hardy and wonderfully profuse in their flowering, and withal of the simplest culture, these qualities should gain for them admission to any garden. The forms of *G. grandiflora* are those which give the best results, and being true perennials need only once planting. These, like the biennial varieties, are easily raised from seeds, while those who have only small gardens and but little time and convenience for raising plants from seed, may like to know that plants of the above in great variety, either separate or mixed, can be procured from dealers in hardy plants.

ENGLISH IRISES.

English Irises are also making a great show just now, and their handsome flowers are so charmingly adapted for vases or general decorative purposes that no garden is complete without them. Many of their flowers are so quaintly beautiful as to defy description. Being bulbous in character their planting must be deferred till the autumn, taking

care to give them a warm sunny position in light sandy well drained soil. A similar position and soil also suit the Spanish Iris, which are rather earlier in flower. Therefore it is desirable that both groups should be represented, and thereby embrace a greater period of their flowers.

LYCHNIS FULGENS AND L. HAAGEANA.

These provide quite an array of colour, such as crimson, scarlet, vermilion, orange scarlet, and white, and therefore constitute a highly effective group of dwarf perennials among early summer flowers. In height they are not more than 15 or 18 inches, and a single tuft will in a good season and fairly rich soil produce as many as a dozen spikes of richly coloured blossoms. They prefer a dry warm place in winter, and are well suited for the front row of a sunny border, where they soon form compact tufts. The individual flowers are much larger than is the case with most of the members of this genus, and are nearly 2 inches across, being produced in terminal and axillary clusters. Few plants are more strikingly beautiful at this time than these, and being easily grown from seeds deserve far more attention than they at present receive.

LILIUMS.

The noble group of hardy plants is well represented just now, prominent among which are the forms of *Thunbergianum* and *davuricum*. Specially fine in the first named is *alutaceum*, a lovely little gem about 9 inches high and rich apricot coloured flowers, a most delightful plant for pot culture, while in the latter we have *citrinum*, a charming light orange in colour, with broadly expanding blossoms on stems nearly or quite 2½ feet high. There are plenty more really good Lilies in both sections, but those named are exceptional colours. *Croceum* (the Orange Lily) is as fine as ever and very telling, and so is the pure white *candidum*. Happily, thus far the disease which carried off this Lily in such quantity a year ago does not appear so badly, though it exhibits itself in some other species. The only way to keep it down is to pick off the affected portions and burn them at once. If left alone it not only disfigures the growth, but is highly detrimental to the bulbs.—J. H. E.

HORTICULTURAL SHOWS.

PORTSMOUTH.—JULY 9TH.

THE Portsmouth Chrysanthemum Society hold a general exhibition in the summer for assisting local charities in the town—a laudable object, and with a patronising public, low prices of admission, and careful management the Committee have been able to hand over handsome sums to the hospitals and deserving causes. Although a three-days show to some extent prevents competition a good representative exhibition is annually produced. The third day generally proves the best in point of attendance, hence justifies the plan adopted. The Victoria Park was, as usual, the site chosen for the Exhibition, and being close to the railway station serves the public and exhibitors alike well. The exhibits were arranged in two large marquees, the specimen plants down the centre of one, and the groups arranged around the sides of the tent made a pleasing display. The other tent contained the softwooded plants in the centre, while on side tables were arranged the cut blooms, fruit and vegetables. As is usual at the Portsmouth shows, whether they be held in the summer or in the autumn, good order prevails, Mr. Power, the courteous Hon. Secretary, being generally found where the work is going on, and he is ably supported by the Assistant Secretary, Mr. B. Miller.

PLANTS.—The principal class was that for twelve stove or greenhouse specimens, not less than six to be in bloom, for which the sums of £15, £10, and £5 were offered. Three competitors staged, making an excellent display. Mr. J. Cypher, nurseryman, Cheltenham, was an easy first; although his specimens were not the giants he is accustomed to show they were large enough with their high quality to win easily. The more noticeable in his group were *Latania borbonica*, the picture of health; *Croton Queen Victoria*, fully 6 feet in diameter, well furnished, and splendidly coloured, *Ixora salicifolia* with good trusses of bloom, *Erica Parmentieriana* freely bloomed, *Ixora Williamsi*, *Statice profusa*, and two *Allamandas*, *Hendersoni* and *nobilis*. Mr. E. Wills, gardener to Mrs. Pearce, The Firs, Bassett, Southampton, was second with healthy specimens of *Statice profusa* fully 5 feet across, *Clerodendron Balfourianum* very fresh, and a healthy well-coloured plant of *Croton Queen Victoria*. Mr. F. Mould, nurseryman, Pewsey, Wilts, was third with good flowering but weak foliage plants. £5 was offered as first prize for four stove or greenhouse specimens, not less than two to be in bloom. Mr. Currey, gardener to Col. Pepper, Milford Hall, Salisbury, was first with healthy well-grown examples of *Kentia Forsteriana*, *Croton Prince of Wales* and *Allamanda Hendersoni*. Mr. C. Penford, gardener to Sir F. Fitzwygram, Bart., M.P. Leigh Park, Havant, was a good second, a well trained and freely flowered plant of *Rhynchospermum jasminoides* being noticeable as well as a highly coloured specimen of *Croton interruptus*. Mr. H. D. Hawkins, gardener to E. Bishop, Esq., The Lawns, Swanwick, was third.

Miscellaneous groups arranged for effect constituted a feature of the Show, seven competing. Mr. Wills was a good first, the plants employed being of the right kinds, while the taste in arrangement was all that could be desired in the space, 10 feet by 8 feet. Narrow-leaved well-coloured *Crotons*, *Cocos Weddelliana* Palms, *Eulalia gracilis*, and Maidenhair Ferns, sufficiently brightened with *Hydrangeas* and *Orchids* prevailed in the group. Mr. Penford was second with a taller arrangement, in which *Vanda suavis*, *Souvenir de Malmaison* Carnations, and

Maidenhair Ferns figured largely. Mr. T. J. Short, nurseryman, St. Edward's Road, Swansea, was awarded third honours for an arrangement which displayed too much close packing of the plants. Effective groups were arranged by competitors in the class, 8 feet by 6 feet, open to Portsea Island only, the best coming from Mr. Hatch, gardener to the Victoria Park Committee. Second Mr. J. Burridge, North End Nursery, Portsmouth.

For three specimen Palms, to be not less than 6 feet high, Messrs. W. & J. F. Legge received the premier award for large old varieties. Mr. Wills second with varieties possessing merit, and in good condition. Mr. Cypher was third. Mr. Penford led the way with one specimen Palm, showing a large one of *Latania borbonica*, Mr. Wills depending upon *Kentia Belmoreana*, for which he received second honours. Mr. Curry was third. Four entered for three Ferns, the stipulation being that they should not be more than 5 feet high. Mr. Wills was first with healthy plants of *Davallia Mooreana* and *Microlepia hirta cristata* as his best plants. Mr. Penford followed closely. Mr. Hawkins was third. The first two exhibitors were placed in the same order for specimen Fern, both showing *Cibotiums*, one spectable, and the other regale. With a freely flowered neatly trained plant of *Erica jubana* Mr. Cypher led the way for a single specimen flowering plant, being followed by Mr. Penford with *Statice profusa*, and Mr. Curry with *Allamanda grandiflora*. With finely coloured *Crotons*, *Sunset* and *Johannis*, Messrs. Cypher and Wills were placed in that order for a specimen foliage plant. *Fuchsias*, *Pelargoniums*, *Cockscombs*, and *Begonias* were creditably shown by Messrs. Hatch, Hawkins, and Burridge. *Coleus* were represented by large pyramidal-trained plants from Mr. H. C. Gale, gardener to Alderman G. E. Kent, Stubbington Lodge, Portsmouth. Mr. Wills had the best table plants—light and neat. For six *Gloxinias*, both in the open class and that confined to Portsea Island only, there was brisk competition, and it was a remarkable fact that in both cases the first prizes were carried off by a dockyard carpenter—Mr. J. Rouse, Durham Street, Southsea.

FRUIT.—The principal class was that for six dishes, Pines excluded. Two only competed. Mr. G. Inglefield, gardener to Sir J. W. Kelk, Bart., Tedworth, Marlborough, was first, staging fairly good Black Hamburgh Grapes, a very fine Hero of Lockinge Melon, good Brown Turkey Figs, and Royal George Peaches. Mr. Penford was placed second, Stirling Castle Peaches, Lord Napier Nectarines, and Penrhyn Castle Melon being his best dishes. For three bunches of black Grapes Mr. W. Tait, gardener to General Napier, Oaklands, Cosham, was awarded first place with medium-sized bunches and fairly coloured large berries. Mr. Inglefield was second with the same variety. White Grapes call for little or no comment, being of moderate quality only. The best green flesh Melon, Hero of Lockinge, was staged by Mr. Inglefield, who took first honours. Second, Mr. Woodfine, gardener to Captain Boyd, Emsworth. The best dish of Peaches was shown by Mr. Inglefield—Royal George in good order, large and highly coloured. Mr. T. Wilkins, gardener to Lady Theodora Guest, Inwood House, Blandford, was second. Mr. Woodfine took first honours for a dish of Nectarines with Elruge, while Mr. Penford had Lord Napier, both being in good order.

VEGETABLES.—These made quite a show in themselves, so numerous were they exhibited. Eight entered for nine sorts, in which two of Potatoes were allowed. For first honours there was a close contest, the premier award falling to Mr. Inglefield, Early London Cauliflowers, Green Globe Artichokes, Canadian Wonder Beans, Trophy Tomatoes, and Sutton's Seedling Potatoes being all good. Mr. Wilkins was second with good Potatoes, Onions, Peas, and Tomatoes. Mr. W. Tait was third. Excellent Tomatoes and Cucumbers were shown in the classes set apart for them, Mr. Inglefield in the former, and Mr. O. Arkell, gardener to A. J. Shinner, Esq., Caller House, Swindon Road, Cheltenham, in the latter class, took the awards for good produce.

CUT FLOWERS.—Hardy flowers in twelve distinct bunches were staged well, the best coming from Mr. B. Ladhams, florist, Shirley, Southampton, who gained the highest award; Mr. R. H. Guy, Palmerston Road, Southsea, being second. For twelve bunches of stove and greenhouse a good display was made, more by the quality than the number of the exhibits. Mr. Penford was easily first, and Mr. Guy second. For both bridal and hallroom bouquets Messrs. F. Perkins and Son, Coventry, were easily first; Mr. Cypher followed in both classes. Messrs. Ewing and Co., South View Nurseries, Havant, had a good collection of cut Roses and shrubs on view, and Mr. B. Ladhams staged a group of hardy flowers not for competition.

TEDDINGTON.—JULY 10TH.

THE Teddington Royal Horticultural Society held a most satisfactory Show last week in the grounds attached to the residence of W. Howard, Esq., The Grove, and this gentleman, who is one of the Vice-Presidents of the Society, also most generously threw open his picturesque and well kept garden to the visitors. The morning was extremely wet, and the prospect seemed to be hopeless, but happily the Committee and their courteous Secretary, Mr. Simmonds, were rewarded for their efforts by a most agreeable change about mid-day, the afternoon and evening proving fine enough to induce a good attendance of visitors. The Show itself, which occupied four large tents, was one of the best the Society has ever held both in number and quality of exhibits, and the only defect was that insufficient space had been provided. The tent devoted to plants and groups might have been half as long again with advantage both to the exhibitors and visitors. There is evidently a considerable amount of vigorous enthusiasm in the Teddington Society, and much of

this is due to the substantial support, in every sense, which is accorded by the gentlemen residing in the district.

The groups of plants in competition were some of the most tasteful we have seen this season, and they would have well merited considerably more space. Mr. E. Coombes, gardener to W. Furze, Esq., Roselands, was first in the amateurs' class, Mr. Fordham of Twickenham leading in the one open to nurserymen, Messrs. Bishop, Buckland, and Reeves securing other prizes. Mr. Munro, Cambridge House Gardens, Twickenham, was first for six stove and greenhouse plants, followed by Messrs. Reeves and Bates, Messrs. Munro, Reid and Bates also taking the prizes for fine-foliage plants, while Ferns and Caladiums were shown by Messrs. Piper, Bishop and Gregory.

The tent devoted to floral decorations was well filled with tasteful productions, numerous excellent stands being shown, but the most artistic of all was a basket of Cattleyas, Adiantum fronds, and Asparagus plumosus sprays from Miss Howard, which deservedly won the first prize in the class, although a basket of Carnations and Gladiolus Colvilli from Mrs. Fulcher was greatly admired and very tastefully set up. Fruits were represented by good samples from Messrs. Bates, Osman, and Waite, the last named being also the leading exhibitor of vegetables, which were extensively shown both by gardeners and cottagers.

The non-competing exhibits comprised a handsome group of Begonias from Messrs. Laing & Son, a group of Orchids from Messrs. Puttock and Shephard, and a group of Orchids from Messrs. Page & Son, all excellent contributions.

ROYAL CALEDONIAN.—JULY 10TH AND 11TH.

THE last summer Show held under the auspices of the above Society was in connection with the National Rose Society's Provincial Show in 1887, when the financial result was a loss. This year the Show extended over two days, both wet, but no doubt there will not be so great a loss as on the previous occasion. The Show was an extremely thin one, there being a painful deficiency of plants. Roses, however, were both numerous and fine, fruit in larger quantity than in previous years, and to vegetables the same remarks will apply.

In the chief plant classes for nurserymen two firms only competed—Messrs. R. B. Laird & Son and Messrs. Ireland & Thomson, to whom first and second prizes were respectively awarded. The finer Crotons and other plants in the premier collection contributed materially to the success of the former firm. In the gardeners' section the first prize for a table of plants went to Mr. Fraser, gardener to R. B. White, Esq., Ardarroch, for an arrangement of which Orchids formed a strong feature. Mr. Grossart, gardener to J. Buchanan, Esq., was second for a much neater table, and Mr. McIntyre, The Glen, Innerleithen, third. Mr. Grossart had the best four Orchids, Mr. Fraser taking second place for these. Mr. Patterson, Millbank; Mr. Grossart, Mr. McIntyre, Darlington, and Mr. McIntyre, The Glen, were the chief prizetakers for stove and greenhouse plants, Heaths, Ferns, Crotons, Dracenas, and others. Herbaceous plants were shown by Messrs. Munro & Ferguson, Portobello, and Mr. Gordon, Falkirk, to whom the prizes were awarded in the order named.

As already stated, Roses were numerous and good. The first prize for forty-eight blooms went to Mr. Hugh Dickson, Belfast; the second to Messrs. J. Cocker & Sons, Aberdeen; and the third to Messrs. D. and W. Croll, Dundee. For twenty-four, Messrs. Cocker were first, Messrs. Croll, second, and Messrs. Smith & Sons, Stranraer, third. Her Majesty, Mrs. John Laing, Merveille de Lyon, Silver Queen, Marie Verdier, and Lady Mary Fitzwilliam were to be found in fine form in the above stands. For twenty-four Teas Messrs. Croll were easily first with very fine blooms, and Messrs. Cocker second. For twelve trusses of Roses there was good competition, Messrs. Croll being again first with bunches of fine Teas, Mr. H. Dickson second with H.P.'s, and Messrs. McGreedy and Son, Portadown, third. For twelve new Roses, Messrs. Smith and Sons were first, Silver Queen, Caroline d'Arden, Lady Alice, and Gloire de Margottin being distinct. Mr. Dickson was second. For twelve white Roses Messrs. McGreedy were first with Merveille de Lyon. For twelve crimson Roses Messrs. Croll won with Mons. E. Y. Teas. For twelve of any dark Rose Mr. Dickson was first with La Rosière. For twelve of any other colour Messrs. Croll won with Lady Mary Fitzwilliam. In the gardeners' section, Mr. A. Kirk, gardener to J. T. Paton, Esq., Alloa, took the chief honours.

Turning to the fruit there was a particularly fine display, especially of Grapes, Mr. Boyd, Callender Park, Falkirk, securing first for two bunches of Black Hamburgs with large, finely finished clusters; and Mr. McHattie, Newbattle, Abbey, was second with fine examples, much larger in the berry than the above, but hardly so well finished. The first for bunches of white Grapes was secured by Mr. McHattie with good but unripe Muscat of Alexandria. The same exhibitor was also first in the class for four bunches. For a collection of eight dishes of fruit Mr. McIndoe, Hutton Hall, Gnisborough, was first with a good lot, the same exhibitor being also first for a dish of Strawberries with Waterloo, a very dark coloured and taking variety. Mr. McIntyre, The Glen, was first for four dishes of Strawberries, Mr. McIndoe had the best Figs, and Mr. Dow, Newbyth, Prestonkirk, the best Melon, a certificate being awarded to a seedling named Sir D. Baird.

Owing to the very warm summer vegetables were better shown than usual, the number of dishes of Potatoes, &c., being very large and the quality good.

Note must be made of the decorative groups contributed by Messrs. Methven & Son, Princes Street, and by Messrs. Dickson & Co., Waterloo Place, in the latter of which were many stands of florists' flowers.

Messrs. Laing and Mather exhibited numerous stands of Carnations, and Mr. Irvine, Jedburgh, some Delphiniums with spike of extraordinary length.

HARDY FRUIT GARDEN.

THE STRAWBERRY SEASON.—Owners of Strawberry beds in the southern districts have, as a rule, every reason to be satisfied with the return for any trouble or expense taken with them, as in all probability heavier crops were never gathered. All the plants, both young and old, flowered strongly, no frosts crippled the best flowers, and heavy rains fell at the right time, when the crops were swelling. A good mulch of straw litter effectually conserved this moisture, and bright dry weather did the rest. In the more northern counties the prospects at one time were equally as promising, but only about half a crop is being gathered, the drought having seriously militated against them. A well-formed Strawberry bed is very difficult to moisten with the aid of the hose or watering pot, especially when it is located on sloping ground, and these are therefore very much at the mercy of the weather.

THE MOST PROFITABLE STRAWBERRIES.—Wherever Laxton's Noble has been given a fair trial it was found more productive than any other early variety. The quality unfortunately is only second rate, but the fruit being large and of taking appearance sells readily. In any case it is worthy of a place in every collection. For an open position the old Alice Maud has few equals, this being early, very productive, taking in appearance, and briskly flavoured. It does not do so well in close or much-sheltered quarters, but is a good variety for the markets. Sir Harry, another old favourite, is moderately early, remarkably productive, bright red in colour, and of rather acid flavour. On the whole Sir J. Paxton is the best variety that can be grown. It is vigorous, very productive, the fruit being large, handsome, firm, and richly flavoured. As a rule it ripens early and holds out longer than any other. We obtained fine ripe fruit of it on June 18th, and the same plants will yield good dessert Strawberries to nearly the end of July. President, a main crop variety, is a great cropper, and good in every respect. La Grosse Sucrée fails on many soils, but where it thrives it is highly productive, ripening rather early, and the quality is fairly good. James Veitch is productive, attains a great size, the quality, however, being second rate; but it is superior to the still larger Auguste Nicaise. Sir C. Napier is somewhat fickle, and in some gardens liable to succumb to severe frosts. It is a fine Strawberry though, and the acidulous flavour pleases many palates. Dr. Hogg is of neat growth, a good cropper, and the fruit large and of superior quality. British Queen cannot be grown everywhere, but where it does succeed it is the favourite variety, the quality being extra good. In some gardens it can only be grown by planting every season. Loxford Hall Seedling is a fairly reliable late variety, but scarcely so profitable as the heavy cropping large-fruited Eleanor or Oxonian.

LAYERING STRAWBERRIES.—When Strawberry plants are established on good ground not much later than the first week in August they attain a good size before wintry weather sets in, and yield a fairly heavy crop of extra fine fruit the following season. By this it will be seen how important it is that the runners be rooted early. The most common plan is to layer a large number into 3-inch pots, a portion of these, or the best of them, being shifted into fruiting pots, and the rest planted out. This is scarcely satisfactory, and the order of things might well be reversed, extra strong plants not always doing best in pots. Nor do Strawberries always transplant well out of pots, especially if allowed to get dry soon after they are planted. Where the younger beds were freely mulched, first with short and then with strawy manure, a considerable number of strong runners will be found already well rooted into this, and these can at once be detached, lifted with a trowel, and planted. If the work is not too long delayed the plants are bound to do well. Another good plan is to place a flat ridge of good soil midway between the rows of Strawberries, the selected runners being pegged or fastened by stones on this. Being kept well supplied with water the runners soon become strongly rooted, and may then be planted with a good ball of soil attached in their fruiting quarters. Treated in either of the foregoing ways they take more quickly to their fresh quarters than when turned out from pots in a root-bound state. If layered into small pots they ought not to be kept too long in these, but should be separated from the parent plants before the soil is crowded with roots, and be at once planted out.

PREPARING GROUND FOR STRAWBERRIES.—A loose, deep, and it may be rich, root run leads to the production of leaves rather than fruit, and if, therefore, the time-honoured plan of planting on trenched ground is adopted the trenching should have been done last autumn or winter. In all moderately warm localities this trenched ground could have been cropped with Ashleaf or other early Potatoes, these being cleared off in time for Strawberries to succeed them, and by the time they are cleared the ground will have settled sufficiently. All, therefore, that is necessary further is to level and well trample the surface and put out the

plants. Newly trenched ground must be heavily trampled, and even ordinarily fresh dug ground must be made quite firm. Naturally retentive and rather rich soils will grow Strawberries admirably without being trenched. We merely manure and dig the intended site for Strawberries some time in winter, cropping this with Ashleaf Potatoes in the spring. The latter are duly cleared off, the ground being then levelled, trampled, and planted.

REMARKS ON PLANTING STRAWBERRIES.—It is a very great mistake to crowd the plants. Nothing is gained, and much may be lost by it. Every plant, even when fully grown, or before it is four years old, should have a clear course round it, the sun and air thereby reaching the clusters of fruit that ought to surround each clump. Neither crowded nor old plants often pay for the room they occupy. As a rule three crops are ample for the plants to perfect, and even then if the culture is good the two first crops are the most profitable. A breadth should be destroyed and another planted every season. In very cold or extra moist localities it pays to plant on slightly raised beds, these being 6 feet wide and holding three rows of plants, with 2 feet pathways between. As a rule, however, they succeed admirably on the level, the rows being from 2 feet to 30 inches apart, according to the variety. The strongest growers, notably Sir J. Paxton, ought, on strong soils especially, to receive the greater distance, the plants being disposed 2 feet apart in the rows, while the less vigorous growers may be put out in rows 2 feet apart, a distance of 18 inches dividing the plants in the rows. A trowel should be used for planting purposes, and care ought to be taken to well bury the roots, but not the crowns, the soil being firmly packed about the former with the handle of the trowel. All should be kept supplied with water till well established, and there is no reason why either Tripoli Onions should not be sown, or a row of Endive or Lettuce planted midway between the rows of young Strawberry plants.

FRUIT FORCING.

PINES.—*Starting Suckers.*—Those will soon be fit to be taken from the plants which formed the early section of summer fruiterers, and the necessary provision for them should be made at once, so that the plants may have the benefit of solar heat in developing growth for as long a time as possible. The means essential are a fermenting bed in a low damp house or pit, and the heat of the bed should be about 90° at 6 inches from the surface, but a few degrees higher may be allowed at the start, care being taken that it does not exceed 95°. The suckers should be taken from the parent plants and placed directly in 5 or 7-inch pots according to size, and watered once to settle the soil about them. Good fibrous loam torn up by hand without any admixture is the most suitable compost, and should be firmly embedded in the pot, causing speedy root-action and sturdy growth. For a week or ten days the house or pit should be kept rather close and moist, affording shade, but giving but little air, and sprinkling the plants through a fine rose syringe once or twice a day according to external influences. As soon as growth takes place more ventilation with less shade is desirable, the change being gradual until the growth is inured to the sun, when ordinary treatment should be given. The plants must not be allowed to become root-bound, but the growth accelerated as far as is consistent with sturdiness, consequently there must be no delay in shifting into the largest or fruiting pots. For Queens and Black Jamaica the fruiting pots may be 10-inch, and for other sorts 11 or 12-inch, using fibrous loam, but more lumpy than for suckers, adding a sprinkling of half-inch bones, and to prevent worms entering the pots a handful of soot or wood ashes may be spread over the drainage.

FIGS.—*Early House.*—The first crop is gathered, and more moisture in the atmosphere will be desirable; therefore resume syringing twice daily, and sprinkling the house as advised before the fruit commenced colouring. Thin the fruits freely if plentiful, reserving those which are nearest the base of the shoots. Tie in the growths to the trellis as they advance, stopping or removing any which are not required, regulating those retained so that they may receive the beneficial effects of light and air to mature them perfectly. Do not allow the trees to suffer by want of water; those in pots or planted out in borders of limited extent will require water frequently, affording on every occasion some stimulating food, such as guano or other manure. Where crops are ripening maintain a free circulation of dry warm air constantly, which is essential to the Figs ripening perfectly. Trees in pots required for early forcing must not be neglected in syringing occasionally; attend also with regularity to watering and supplying liquid manure.

MELONS.—It is important that the late plants be put out without delay, especially where the means of affording artificial heat is confined to fermenting materials. Sufficient should be used to raise a bottom heat of about 90°, so as to start the plants quickly. In houses as the crops are cleared the plants, if exhausted, should be removed, and preparation made for a fresh start at the earliest opportunity; but if the plants are in good health it is folly to root them out, as they will come into bearing again much sooner than young plants; and if the foliage is kept healthy they will continue bearing as late as it is desirable. When the crop is cut the plants should be divested of most of the old and damaged leaves, fresh growth being encouraged in the place of that exhausted, which should be cut away. The surface of the bed should be loosened, and the soil removed, applying a couple of inches in depth of fresh loam, giving a good watering, and when growth is taking place afford a free application of liquid manure, and treat as for former crops. When Melons are grown upon the continuous system it is well to note that the laterals will grow freely and show fruit abundantly after a few

joints of growth. The flowers after being fertilised will set and the fruits swell freely, so that sufficient moisture only need be accorded to maintain the plants in continuous bearing. Attend to stopping, thinning, tying, or otherwise regulating the shoots, not allowing pressure of work in other departments to interfere with this, or the results will be detrimental.

Successional plants should be earthed up as soon as the roots show at the sides of the hillocks, making the soil firm, being careful that the plants do not suffer by want of water, nor, on the other hand, have it in excess. To plants swelling their fruits supply weak liquid manure occasionally. Maintain a bottom heat of 80° to 85°, and provide a moist atmosphere to growing crops. Syringe freely, except when the fruit is setting or ripening, being careful in the restricted system not to allow one or two fruit to take the lead, but have them all as nearly as possible of one size on a plant.

VINES.—*Scalding.*—This is very common to some Vines, notably Lady Downe's, and in lesser degree to Muscats. Various causes have been assigned for it, but whatever these may be the remedy is very decided—viz., to admit air rather freely, especially in the early part of the day and through the day, with a little at night and a genial warmth in the pipes so as to maintain a temperature of about 70° artificially. It is most prevalent towards the close of the stoning period, a fortnight to three weeks before the Grapes change colour for ripening. A slight shade at this period is advantageous, particularly to Muscats, and during the early stages of ripening, when the weather is very bright, a double thickness of herring nets drawn over the roof lights is of great benefit in subduing the fierce rays of the sun from the middle of June to early August. When the Grapes begin changing colour danger from scalding is usually past; yet Muscats are not then safe, as a sudden spell of very bright weather following a dull and moist period is very disastrous to that part of the bunches directly exposed to the sun's rays, hence the necessity of a keen eye and a ready hand to promptly avert disaster.

Shanking.—Great loss is occasioned by this malady, if it be one. It need not create any great anxiety to cultivators who are careful to build on a solid foundation, as the evil is caused, so far as is known, by suspended root action at the critical period of the Grapes ripening. This may result from various errors. One of the chief is deficiency of ventilation in the early stages, combined with too much moisture, inducing long-jointed growth and thin foliage, or it may be the roots are deep in favourable soil. To avoid shanking properly made borders and well managed Vines are essential, being careful to fully expose the foliage to light and air, allowing no more leaves than can have those essentials, not seeking to encourage root action by a thicket of growth which must sooner or later be removed in quantity, and give a check to the food supplies when they are most needed; yet as much foliage should be allowed as can have due exposure, so that supplies of nutriment may be steadily maintained. Shanking is strictly cultural, and as such avoidable by judicious treatment. Regulate the young growths, adopting the extension rather than the restrictive system where there is room for it without crowding, keeping gross laterals stopped, so as to cause an equal flow of sap throughout the Vines.

THE FLOWER GARDEN.

Propagating Pinks and Carnations.—In many districts a disease which affects this class of plants has either destroyed or greatly weakened both Pinks and Carnations, and there is therefore all the more necessity to raise healthy young plants. The surest way of increasing the stock of Carnations is by layering the strongest or best placed shoots, this being done late in July or early in August; but the Pinks must be principally struck from cuttings or "pipings," and a considerable number of Carnations may also be raised in the same manner. A very little bottom heat is necessary, and if a partially exhausted hotbed is not available it is advisable to form one in a rather cool position with equal portions of leaves and well-prepared stable manure. The frame being duly set on this, and if rather deep, half filled with the shortest of the heating material, about 6 inches of fine loamy sandy soil should be spread over the surface of the bed, and this in its turn faced over with sharp sand. The cuttings ought, where possible, to be slipped off the old stems, and supposing they are not more than 5 inches long only the old lower leaves should be trimmed off, and the rough lower end of the base lightly shortened to a joint, and many of these also will strike. All should be quickly dibbled in about 2 inches apart and rather less than 1 inch deep, and be firmly fixed. After a watering has been given, and the foliage dried again, place on the lights and keep the frame rather close, also shade from bright sun till the cuttings are rooted. The soil must not be allowed to become dry, and not till these are rooted should air be admitted freely. If frames are scarce handlights may be substituted, but only in warm and rather moist districts do the cuttings root freely in handlights or frames without the assistance of bottom heat.

Roses from Cuttings.—In spite of extra pains being taken with the cuttings of hard wood inserted in the open ground late last autumn fewer of them were struck than usual. Own-root Roses are so useful that it becomes all the more necessary to attempt summer propagation. Some varieties can be rooted in the summer that absolutely refuse to grow from cuttings made from the ripened wood in the autumn. Any medium-sized shoot of either Hybrid Perpetuals, Teas, and Noisettes, including the ever popular Maréchal Niel and Gloire de Dijon, is after it has flowered suitable for making into a cutting. It should be cut with a small slice or "heel" of old wood attached, and

be shortened to the third or fourth joint, only quite the lowest leaf being removed. Insert these firmly round the sides of 5-inch pots filled with gritty loamy soil, and give a good watering. They ought then to be set in a close frame or handlights for about ten days, when all should be plunged in a gentle hotbed, being from first to last kept close, fairly moist, and shaded from bright sunshine. When rooted and potted singly into 3-inch pots, they in due course will make capital plants for either pot or open air culture.

Budding Rose Stocks.—In many instances the buds are sufficiently advanced for the purpose of being inserted in either Briar or Manetti stocks. No very great amount of skill is required, young beginners not unfrequently being most successful in their budding operations. Very much in all cases depends upon the state of the stock—that is to say, whether the bark opens freely or not, and it is also of importance that the small shields with bud and much shortened leafstalk attached separate readily from the wood. Details have often been given, and it is scarcely necessary to repeat them here.

Watering Herbaceous Plants.—Most of the herbaceous plants are capable of withstanding a fairly long spell of dry hot weather, but newly formed borders ought now to be frequently and well watered, and if not already done a mulching of either short manure, grass from the mowing machine, leaf soil, or dry fresh soil given. The herbaceous Phloxes are the first to suffer, and these repay for a heavy soaking of water occasionally.

PLANT HOUSES.

Lilium candidum.—For increasing the stock of these plants to be forced another year good bulbs should be procured as early as possible and placed singly in 6-inch pots, or four bulbs may be placed in 10-inch pots. Use for a compost good fibry loam, one-seventh of decayed manure and sand, with about the same quantity of leaf mould as manure. The pots should be well drained, the soil pressed moderately firm, and the bulbs covered about an inch deep. The pots may be stood outside or in a frame; the latter is most suitable if wet weather follows the potting. If bulbs from the open borders are relied upon for forcing they should be lifted directly the flowers fade. The old flower stems can then be cut away, when fresh foliage will quickly issue from the base.

Lilium longiflorum.—Pay attention to the watering of these plants and the variety *Harrisi* after they have ceased flowering until the stems naturally die away. This is the only attention needed at present if the pots are stood outside in a position where they are partially shaded from the sun. Do not allow plants of *L. lancifolium* and others to suffer by insufficient supplies of water at their roots, or the foliage will turn yellow. On the other hand be careful not to overwater them. Weak stimulants may with advantage be given occasionally.

Cyclamens.—Plants raised from seed sown last August should be placed in their flowering pots, 5, 6, or 7-inch, according to the strength of the plants and the sizes they are now in. In potting the soil should be pressed more firmly than before, and may consist of good fibry loam, one-seventh of cow manure and sand. The pots should be well drained, for abundance of water is needed when the plants are growing vigorously. They should stand upon some moisture-holding base and be arranged near the glass in a light airy structure or in cold frames. For ten days or a fortnight they should be kept rather close until they are rooting freely in the new compost, then admit air gradually until abundance can be given both during the day and at night. They will do without shade provided the syringe is freely used several times during the day if the plants display the least signs of distress. Light shade for a few hours during the hottest part of the day will, however, do no harm. Shift smaller plants as they require more root room. Old plants if duly supplied with water will soon commence fresh growth, and may then be turned out, the old soil partially removed from their roots, and the plants placed in the same or a little larger pots. They should then be subjected to the same treatment as the younger plants.

Grevillea robusta.—When these plants are grown under glass they soon become too tall for many forms of decoration. They grow less rapidly if placed outside where they are sheltered from bright sunshine. Seed now sown in heat will afford plants suitable for rooms at a time when the majority of those raised earlier have been destroyed by doing duty in such positions. Plants raised now will only be small on the approach of winter, but they will grow quickly if given stove treatment until just before they are required for furnishing purposes. The leaves are very useful in a cut state, they last well, and for edging large vases are in many positions superior to Ferns. For this purpose it is a good plan to grow a few plants to a large size, and train them against the end or back wall of any light suitable structure.

Salvias.—Whether growing in pots or planted outside, the shoots must be pinched until the middle of next month, or the plants will grow tall instead of remaining dwarf and bushy. When grown in pots liberal support is necessary after the pots become full of roots, or the plants lose their lower foliage. They must be grown in an open sunny position.

Celosias.—Plants for autumn and winter decoration should be placed at once into their flowering pots, which may vary from 4 to 6-inch. Those for the former will be transferred from boxes, while for the latter the plants should be sturdy in 4-inch pots at the present time. Use for potting good loam, one-seventh of manure and a little sand. Press the soil firmer than in the previous potting. Supply the plants with an upright stake each, and encourage sturdy growth by the admission of abundance of air.

Rhodanthes.—Prepare more of these by sowing seed in 5-inch pots. Place the pots in a frame until the seed has germinated, then give the plants full exposure. They will be found very useful for the conservatory in the autumn.

Marguerites.—Stand young plants ready for 5-inch pots on a bed of ashes fully exposed to the sun, and pay attention to the pinching of the shoots, so that the plants will be dwarf at housing time. They soon run up tall if not prevented. Press the soil round the roots as firmly as possible.

Hydrangeas.—Gradually harden those that are rooted, then expose them to full sun outside in the small pots in which they have been rooted. Insert cuttings of lengthened growths singly in small pots, and cover them with handlights in some warm structure. Shade from the sun, and keep them moist until rooted.

IMPROVED QUEEN REARING.

"A LANARKSHIRE BEE-KEEPER," page 528, last vol., asks me to deal with this subject. I have not been able to do sooner. I can only write for a short time now, and though I am improving in health slowly it will be a long time before "I am as I was." I will, however, tell our friend how to raise queens, and if he follows the plan out to the second generation I will guarantee that the bees produced will truly hibernate, or at least as truly as a wasp does, though I shall not have time to explain the matter in this communication.

When your best stock swarms catch the queen, which is easy enough if clipped, and let the bees go back to feed and develop the cells. Towards the eighth day make up your nuclei, which should not be less than three ordinary frames of comb. Now look out for your stock swarming again. When it does give it on the combs, and as soon as settled nicely on them distribute the combs into as many empty hives. This saves much time in looking for the young queens, as the bees on those combs without a queen will quickly begin to go back to the old stock hive, and if they remain quiet they have a queen with them, and being fewer bees, are more readily found and given to the nuclei. Remove all the queens—sometimes six to twenty-five queens may be found, every one of which may be saved, as their presence is easily noted by the bees keeping quiet or going back. The next day the old stock hive will swarm again and the same process repeated. But on no account must the old stock hive be opened to lift a frame. If this is done the cells are chilled and the development of the queen is retarded, resulting in a worthless one. The advantage of sending the bees back is to provide sufficient to keep them warm enough and protect the queens till they are three or four days old, by which time they are fully matured.

But do I hear someone saying I am breeding for the "swarming impulse," which they would like to "breed out?" I do not think for a moment that this will ever be bred out, or at least until bees cease to breed at all; but if persons would like to breed queens from eggs laid by queens not under the swarming fever, or even a queen or two from some other mother, all they have to do is to graft or fix a piece of comb containing the selected eggs into a frame and put it into the stock that has swarmed, and queen cells will be surely started on the eggs. I made this discovery in 1887. It worked well last year, and this year has been a glorious success. Here is what I discovered. "When a stock of bees is under the swarming fever they will rear queen cells while they have an egg or larva in the hive—drone eggs or not—and when these cells mature, though they allow one to hatch, they never allow her to destroy or kill any of the maturing queens. Also, although there may be a virgin queen hatched out, cells sealed, and queens piping, they will still rear fresh ones, even on drone brood, if they have the chance."

Of course such a stock will swarm, but all one has to do is to catch and remove the queens and let the bees go back.

I have also discovered how to throw any stock into the swarming fever and keep it on all the summer, and thus rear queens wholesale in one stock, and have them hatching out daily or weekly just as I wish.

On pp. 33 and 34 "A Lanarkshire Bee-keeper" gives some advice which, though much in advance of what is taught, in my opinion does not go far enough—viz., his advice to take queens "as they creep out of their cells, or are about to do so." This would be at the end of the sixteenth day from the deposit of the eggs. Now, if the bees which have charge of the cells are under the "swarming impulse" they will keep them imprisoned and feed them until the eighteenth day, and no frame of cells should be

lifted up before. It is exciting work after the bees are shaken off to catch the queens as they hatch out.

When just cleared of bees the noise made by the queens much resembles the crackling of burning white deal sticks, and all cells will have a little hole in them, through which the enclosed queens will be thrusting their probosces. But this does not last more than half a minute before some of the queens are creeping out, and if not caught they will take wing or try to kill each another. These must at once be given to nuclei or queenless hives, and all those cells which have no hole in them should be thrown away if good mothers are required, as their development has been retarded during the time the cells have been out of their hive, for though queens would hatch from these cells they would be of inferior quality; they, however, can all be saved by "swarming" the hive and catching the queens in the swarms.

When I reared the two Punic queens sent to our friend—not "Pumice," please—there were about 150 sealed cells. I had nearly fifty queens from them, and some twenty or thirty took wing, or were killed; the undeveloped cells I threw into the waste comb box to melt up for wax. I had more than I required or could find nuclei for. These queens, though one or two days old, are not fit to send a distance, but must be given to good nuclei of at least three combs well covered with bees for two days more; thus it will be seen good virgin queens cannot yet be reared for sale at "tuppence apiece," even if I can get 100 per week from one stock.

Those queens sent to "A.L.B.K." were not selected in any way, and if they have mated to good drones he will be able for once to see bees truly hybernate, though they are natives of a country in which frost and snow is never known, and where the swarming and honey months are in the winter, so that next year he will be able to say whether my way of breeding is any improvement or not on the old plans.

Your able correspondent speaks of the queens being "lively" and trying to conceal themselves. This is just what well bred queens will or should do. One day I was ten minutes trying to find one on a comb that had not twenty worker bees on it, and they were all of another race and colour. She ran round to the other side every time I turned the comb round. A queen quick on her feet is the one to fill the cells with eggs before the workers do so with honey. She never looks extra large when laying. A weak queen always looks large when laying for two reasons—firstly, she does not lay fast enough and the bees stimulate her all the more. The novice seeing such a queen crawling with difficulty on a comb would remark on her being such a "fine one." The queens of my own breeding, though laying upwards of 3000 eggs daily, run about like spiders.—A HALLAMSHIRE BEE-KEEPER.

HONEY PROSPECTS.

WE had up till the 5th July five weeks of fine weather, but too dry for either bees or crops. The latter are languishing for want of moisture, and the former are denied the large flow of honey that they usually gather in fine weather, when the atmosphere and ground are humid. It is too early to anticipate with certainty what the honey yield will be, but it is certain without some rain there will be little surplus, and with it, unless of very short duration, results will be much the same. In some districts we hear of heavy hives and well filled supers, but as yet we have only the former. The season throughout has been peculiar, being so cold and ungenial until the middle of May that bees could not advance, consequently breeding in earnest did not begin until the above date. The Apples, Pears, and Plums were the only flowers, including the Dandelion, the bees could visit. There was no Plane blossom. Fine weather set in with June, and most hives, notwithstanding the previous drawbacks, were well forward, but strange to say the bees are not more numerous now than they were then, owing to their wings becoming worn and tattered. No year passes without a per-centage of loss from this cause, but in no year has there been so much mortality amongst bees, which puzzles the oldest bee-keepers, who cannot account for it.

The fatality usually begins with the appearance of the Charlock, as it has done this year, but whether it is owing to it or not we cannot say, but perhaps owing to the extreme dryness and little honey in the flowers, the bees have extra flying to perform before they can secure loads, thereby wearing their wings sooner than usual.

Although our hives were full of bees long since I did not deem it advisable to super before the 3rd inst. We want now to get a large surplus, a few showers which would benefit crops and bees alike.

MEAD A CURE FOR HAY FEVER.

For some years past I have been subject to severe attacks of what is termed hay fever, but cannot say whether that is a proper

term or not. This year has been no exception to the rule, and I have suffered more than usual. Happening to have some mead beside me I partook of some of it, and derived great relief.—A LANARKSHIRE BEE-KEEPER.

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (A Reader).—As the books you mention are not on our list, we are unable to supply the information you desire.

Missing Parcel (Nottingham).—We have received a direction label which has presumably been detached from a parcel that was intended to reach us, but has failed to do so. The label bears the postmark of the town above mentioned.

Seedling Picotees (Job Cox).—The varieties are very good for border decoration, but few, if any of them, possess the requisite properties of high-class florists' flowers; or in other words, they are not equal in merit to the best named varieties.

Melons Cracking (A. C.).—Wednesday morning's letters can only be answered in the briefest possible manner. An excess of water at the roots, or of moisture in the atmosphere, coupled with too late morning ventilation, are the chief causes of the cracking of the fruits.

Sparmannia africana (Salopia).—You have probably been too liberal in potting for inducing early flowering. As the plant is healthy let it remain outdoors, but it may be desirable to shade the pot from hot sun. If the soil in the pot is not very firm make it so with a blunt-ended stick. Do not overwater; still the leaves must not be allowed to flag through drought at the roots.

Insects on Chrysanthemums (Novice).—Perhaps the insects to which you refer as "Jack Jumpers" do not do much harm. Try the effect of syringing with perfectly clear soot water. It may be made as bright as wine by placing a few lumps of lime in it and removing the scum from the surface, and should be of the colour of very pale ale when used in the evening. All you can do is to take the first bud that forms in the end of each branch. These will be crown buds, and under good management should develop into fine blooms. Three branches from a main stem are sufficient.

Clover in Tennis Lawn (E. Wilkins).—We doubt whether you can destroy the Clover without spoiling the lawn. Nitrogenous manures, such as nitrate of soda or sulphate of ammonia, applied at the rate of about an ounce to the square yard encourage the growth of grass at the expense of Clover, but there is the risk of the grass being coarse for a time, then of the lawn eventually becoming thin. We have no doubt several persons would be glad of such a lawn as the one you complain of. New lawns can be made without Clover by sowing a suitable mixture of grass seeds in well prepared soil. The flower you send is a very bright form of *Lychnis Haageana*.

Seedling Carnation (H. D.).—The scarlet Carnation, which you say is of good habit with sixty blooms on a plant layered last year and easily forced, is worth preserving, whether it is distinct from other varieties or not. This can be ascertained by sending flowers to the National Carnation and Picotee Society's Show, Volunteer Drill Hall, Westminster, on the 23rd inst. You may write previously to Mr. J. Douglas, Great Gearies, Ilford Essex, and send him blooms if you wish. It is a decorative variety, and if the plant is vigorous and floriferous it might be useful for affording flowers for market. Those before us have close not split pods, which is a point of merit, but are scarcely fragrant, which is not.

Chrysanthemum Shoots Injured (J. S. R.).—If you had seen the shrivelled state of the small shoots that had been pushed into a small box without a particle of anything to keep them fresh, you would perhaps have been a little surprised. So far as we can see the plants have been attacked with either caterpillars or earwigs, perhaps both, and you should examine them after dark by suddenly turning a light on them. Earwig traps, such as hollow stems, or small pots with hay in

them, should be provided, and examined every morning. One of the stems appears as if punctured by a small weevil, or the injury may have been done by doubling the shoots into the box; no one could be sure on the point, and if you send again please follow our instructions below on sending specimens through the post.

Arranging Houses (J. G.).—A site shaded by trees till twelve o'clock is not suitable for vineries, Cucumbers, and greenhouse plants, as they cannot have too much light, or if shade be necessary it is best afforded artificially. Of the two plans we should prefer to have all the houses span-roofed, with the ends north and south. The vineries being 18 feet long there will be room for two Vines on each side, each Vine having two rods at 4½ feet apart, which will give very much better results than were they closer together. It is immaterial as to the length of rafter; the most important factor is space—due exposure of the foliage to light and air. Of the boilers named it would be difficult to point out the "best," since all are good in heating power, and easily attended to. With plenty of depth an upright form would occupy the least space, but if you cannot make a deep stokehole a saddle form might answer your purpose.

Hoya bella (J. P.).—Although you have failed to see references to this charming flower, it does not follow its culture has not been

FIG. 7.—HOYA BELLA.

described in our columns. Only a few years ago the following appeared, and we think the information is just what you require:—"One of the most charming little plants for the stove is Hoya bella, an umbel and spray of which are shown in the annexed woodcut. It is a diminutive and delicate counterpart of the well-known Hoya carnosa, and like its equally pretty relative, H. Paxtoni, is much better suited than the old species for a shelf near the glass in the stove, as they are both dwarf and compact in habit, with small umbels of flowers. These two species have long been great favourites, and they are, when well grown, invariably admired. Similar treatment suits them both—namely, a compost of loam, peat, sand, with finely broken charcoal and old mortar rubbish pounded, the pots being thoroughly drained. A warm position in the stove is required, where the plants can be fully exposed to the light; otherwise they are liable to become sickly and unsatisfactory. H. bella has been in cultivation more than thirty years, and might be expected to be in almost every collection of plants; but such is by no means the case, for there are many gardens of more than ordinary pretensions where it is not grown. This neglect of a beautiful plant is strange, for when its delicate, wax-like white flowers, with their rich purple central ray, are fully expanded, the plant is unrivalled except by its near relative, H. Paxtoni. The neat trusses of flowers are invaluable for cutting when something particularly choice is required."

If you wish for more particulars on any point we shall be glad to supply them.

Palms and Bamboos (Pat Murphy).—You say you repotted the plants three months ago, yet now ask what soil they want? It would perhaps have been better to have obtained the information before. The plants, however, are not very particular in respect to soil, and grow well in turfy loam of medium texture with a little bruised charcoal intermixed for keeping it sweet and porous. The turf being of a springy nature should be pressed down firmly. With good attention in watering large healthy plants may be grown in comparatively small pots. If the soil gets too dry before water is given the leaves lose colour, as they also do in a very dry atmosphere and under the influence of hot sun. At the same time the earth in the pots must not be kept like a puddle. The Bamboos will be as well in a shady place outdoors as under glass, and perhaps the Palms also; but you do not mention their names. Possibly you do not know them. However, we do not think you will err in letting them remain where they are so long as warm weather continues, taking them in on the approach of chilly nights in autumn. Sprinkle the ashes on whatever the pots stand on frequently, and the vapour arising will be beneficial to the plants.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (N. H. P.).—Campanula rhomboidea. (H. F. E.).—1, Specimen not good, perhaps Chlorophyton orchidastrium. 2, Veronica spicata. 3, Tradescantia virginica.

COVENT GARDEN MARKET.—JULY 17TH.

Trade brisk, with fair supplies of soft fruit. Hothouse goods in less demand.

FERTILITY.

Now is the time to give especial study to the effect of manure upon the land by close and repeated inspections of crops as they approach maturity. Results are before us; each field of the farm is like the page of an open book, a manual in plain and simple language, telling us as nothing else can do of the condition of the land and of the soundness or the faults of our practice. We may well remind our readers that for land to do this in a reliable manner it is essential that both drainage and mechanical division are efficient. Manure cannot act in a satisfactory manner upon soil that is badly drained or deficient in porosity. Then, too, the manner and time of its application may also affect results. Experimental stations have taught us much about what to avoid and what to use, but they have not given precise information for general guidance, nor can they ever do so.

Sustained fertility of well drained, well cultivated soil, is the essential basis of good farming, and it ought to be the aim of every farmer to apply manure in the most economical and certain manner, so as to insure a full development of each consecutive crop, and never to exhaust the soil. As crops approach maturity we are able to see if we have been successful in this important work, for no matter how unfavourable the season is really good farming always tells. One of the most satisfactory crops we have just now is a fifty-acre field of Barley at a farm which came in hand at Michaelmas, 1887. This is heavy land, and it was then about as full of couch grass as it could well be. Ploughs, cultivators, harrows, and men with rakes and steel forks, were all brought into action upon the grass in spring and early summer last year. The season was too wet for couch fires, and the whole of it was carted off the land into huge heaps, and when the soil was as clean as we could make it, it was manured heavily with farmyard manure in the furrows, and roots sown—Mangolds first, followed by Swedes and white Turnips. The only profit, or rather remuneration, we got for all this work last year was from the sheep with which the whole of it was subsequently folded. But the sheep gave finish to our work by storing the soil with manure. It was ploughed immediately after the sheep were withdrawn. Barley sowing followed in due course, and now an excellent crop of it affords most satisfactory evidence of the soundness of the practice.

On the same farm a field of Defiance Wheat shows we were right in thinking the residue of manure from the dressing given it last year was sufficient to produce a full crop this year. The straw is almost 6 feet in height, and is crowned with such fine ears that the corn yield bids fair to be one of extraordinary abundance. Close by it there are a couple of acres of the new white Salvator Wheat, some of which is 7 feet in height, and about which we hope to have something to say later on. This land will, of course, require a full dressing of manure next season. In other fields, where Barley was sown after Barley, a half dressing of mixed chemical manures was sufficient to prevent exhaustion and ensure a full crop.

Perhaps one of the most remarkable signs of progress is the importance now given to the use of mixed food for animals, and and mixed manures for the land. A recent inspection of the experimental farm at Woburn showed that mixed nitrogenous and

mineral manures ensure full corn crops, while plots dressed only with minerals or nitrates were decidedly inferior. The trials this year are all the more important, from the fact of the weather having been so favourable for chemical manure to take full effect upon the soil. In using chemical manure especial care is necessary to prevent waste, and to ensure speedy action so far as is possible. To apply such manure to the surface without a prospect of rain involves a serious risk of failure; to apply it too soon or too late also points to loss. No matter how wet the season, we were never too early in using it upon pasture of any kind, for the soil is so crowded with roots that the nitrates are taken up as they are dissolved, and the slower action of the minerals is equally certain. Nor do we ever hesitate to use it with spring or winter corn at the time of sowing, if only we know the soil to be of sound staple. Much caution is requisite in using it on very heavy land, for if left exposed upon the surface much of it may be washed away by heavy rain. We repeat, that in the trials of manures greater prominence is not given to sheep folding, for we hold that of all manures used in agriculture the first place must be assigned to that imparted to the soil by sheep folding, both for economy and efficiency.

WORK ON THE HOME FARM.

Ploughs, harrows, and hoes have been kept briskly at work upon all fallow land to destroy weeds and get the summer culture as forward as possible before harvest. Docks and thistles have also been destroyed with other weeds around the margins of corn fields. This work is of special importance now, as such weeds are plentiful enough this year to spread seed far and wide if they are at all neglected. Haystacks have been thatched, and so the best crop in quality and quantity that we have had since 1885 is safe, and much of it will probably be held over till next year, for it is unlikely that we shall have so fine a crop two years in succession. We have upwards of two hundred tons upon the home farm, and have made a special insurance of it apart from the other stock and crop insurance. In doing this we had to remember the possibility of much of it being kept till it became more valuable than it is likely to be next winter, and an approximate value was put upon it. The delicious aroma in the air near all the stacks affords the best indication of that development of flavour by heating which is so essential in good fodder, and the colour is of that bright green hue which is a sure indication of well made hay.

At all our farms we have now a full stock of store pigs coming on for the corn stubbles. For the first few weeks when old enough they had enough corn offal to keep them in a healthy condition, and now they are kept solely upon green peas and beans brought from the fields as required. We do this on the principle that a farm should be self-supporting. A remarkable instance of how well and profitably this may be done came recently under our notice upon a small farm which we surveyed for purchase. It has been in the hands of two brothers as tenants for thirteen years, and during the whole of that time no corn has been sold, but all has been consumed upon the farm chiefly by pigs. The land has thus been well manured, and the pigs sold when ready for the butcher. So well has this answered that the tenants were able to attend the sale in view of becoming owners of the farm. It was with regret that we as representing a large and wealthy landowner had to outbid them, and glad indeed were we subsequently to secure them as tenants.

REMARKS.

7th.—Generally bright morning; cloudy afternoon; fair night.
8th.—Cloudy morning, and spots of rain early; wet from noon to 2 P.M.; showery after noon and wet evening.
9th.—Cloudy morning; fine afternoon, with some sunshine; wet evening.
10th.—Wet morning; sunsh. and showers in afternoon and evening.
11th.—Bright and fresh.
12th.—Cloudy morning; slight thunderstorm at 4 P.M., and wet night.
13th.—Fine, with some sun.
Temperature very similar to the previous week, but its daily range less, owing to cloud and rain. On July 12th, when only 0.06 in. of rain fell here, there was excessive rain in the South Midland counties, upwards of 3 inches falling at some stations.—G. J. SYM NS.

PEACH TREES.

IT is a very common method of culture to throw open the ventilators of the structure in which Peach trees are grown, water the border occasionally, and in other respects to leave the trees practically to themselves until the foliage ripens off naturally; or, prematurely, if the trees are infested with insects. Success may be the result, and undoubtedly is in many instances, but a crop of good fruit under such circumstances is due to chance rather than good management.

It is important that the trees be examined critically after the crop has been gathered, for they may represent three distinct conditions of growth at the very least. There may be shoots too robust to retain their flower buds; others may be in the very opposite condition, too weak with almost colourless foliage, exhausted by the strain of fruit-bearing, and perhaps not the best of treatment; while others will be in an intermediate state, having produced wood of the best quality for yielding with certainty and good management a crop of fruit next year. It will be seen that trees under such differing conditions of growth must not be subjected to the same treatment, or failure in two out of the three cases will follow. It is too late when the foliage falls to check those that are too luxuriant for insuring the retention of the buds when the trees are started into growth. It is also too late to recruit those that are thoroughly exhausted. They, unlike the others, will again bear a heavy crop of fruit, but it will be liable to fall before it is ripe, or if carried until it reaches that stage it will be hard and flavourless, proving of third-rate quality only. This, by good and timely treatment, may be overcome, the vigour of the trees increased, and the quality of the fruit raised to a much higher standard of excellence.

In first and second houses the whole of the old bearing wood and all growths not required for furnishing the trees another year should be at once removed. The foliage of vigorous trees being very large the growths should be severely thinned, so that every ray of light and air can reach the wood to ripen it. This is important, and if it cannot be accomplished by natural means artificial heat must be resorted to. So far we have had a fine season, but trees with strong wood are still far from ripe. During spells of damp weather the pipes must be made warm, having abundance of air on at the same time and a somewhat dry atmosphere maintained. The syringe should be withheld and no more water given than is necessary for preventing growth being brought to a standstill by dryness at their roots. Until vigorous growth has been checked do not shorten any shoots that have extended too far, or in a few days fresh growths will push from nearly every eye. In trees of feeble health there will be no long shoots to shorten, while in those that have made moderate growth any that need shortening may be done during the thinning process.

After the old bearing wood has been removed and the remaining shoots evenly disposed over the trellis the trees should be cleared of insects if any are established upon them. The strong trees are almost certain to be clean, but this may not be the case with those in the other conditions of growth. For red spider the trees should be thoroughly syringed with a mixture of sulphur and water—a 3-inch flowerpotful of the former to every four gallons of water that may be needed. If this is left on for three or four bright days it will destroy the spider as well as any mildew that

may infest the trees. Scale is perhaps the most troublesome insect to deal with effectually; but this may be eradicated by two or three applications, at intervals of a few weeks, of petroleum and softsoap. Three ounces of petroleum may be used in four gallons of water, with half an ounce of softsoap and a piece of washing soda the size of a Cob nut. The oil must be well broken up by the method so frequently described, and before syringing the trees tiffany should be spread over the roof to break the full force of the sun until the oil has evaporated.

To return to the trees of strong growth, if the whole or nearly the whole of the flower buds do not fall, but expand, and to all appearance set well, the growth will take the lead and the fruits fail to swell. One evil is as bad as the other, but perhaps the last is the more disappointing. Trees that are well cared for and only moderately cropped are liable to over-luxuriance, much more so if the soil in which they are growing is of a light instead of inclining to a heavy nature. A trench should be cut at once round such trees, and some, but not too many, of the most active roots removed. All that is needed now is to check them so that the trees will not make soft growth, yet retain their foliage so that the buds can be plumped and the wood as well ripened as possible. If the trees are too severely root-pruned the leaves will flag, and perhaps many may fall, with the result that the buds will remain stationary, and the wood ripen prematurely. The work should be so done that recourse to the syringe is not needed for keeping the leaves fresh. The soil may be returned to the trees without any addition, but if the border is light one or two barrowfuls of dried and powdered clay may be given to each tree according to its size. The trees can then be lifted, and it may not be necessary to cut away many roots, the mere lifting in most cases will prove ample. The soil should be worked well from amongst the roots and the powdered clay incorporated with it as it is returned. Strong trees subjected to this treatment will bear next year and swell the fruit to a good size, and in addition make stout but sturdy wood that will be certain to retain its buds and set a good crop the following season, other treatment being right.

Exhausted trees require the very opposite treatment. A trench should be cut round sufficiently far not to injure one of the roots, working soil amongst them until a number of fibrous roots are laid bare. These should be laid in fresh compost, consisting of rich turfy loam, chopped; if inclined to be light add powdered clay and a little quick-acting chemical manure, a sprinkling of which may also be dusted on the surface, the border well mulched with moderately fresh manure. If trees in this condition are freely syringed and judiciously watered the most valuable ingredients of the manure will be washed down to their roots, which will increase materially by autumn. Next season a marked change will be perceptible in the growth, and an equally satisfactory change in the size and quality of the fruit. When the soil is heavy and trees become exhausted in it the addition of loam of a lighter nature, a little gritty material, or old lime rubbish will prove of much advantage.

Trees in an exhausted condition that have not been lifted periodically are better partially lifted at the present time, and left to make a season's growth before they are dug up entirely. In the meantime they will make quantities of healthy fibrous roots, bear a crop of fruit, and be in the best possible condition for replanting next autumn.

Trees of moderate growth with plump buds and healthy foliage need no special treatment. The old bearing wood removed, the foliage kept clean, the border mulched and watered from time to time, and the ventilators of the house left wide open day and night they will be in the best condition another year; but if the other examples cited were treated in the same manner failure with them would be inevitable.

As a rule, though there are many exceptions, there is too little pruning or thinning of Peach trees in summer and too much

in winter, unless the branches and shoots are left in an overcrowded state.—WM. BARDNEY.

STANDARD MIGNONETTE.

STANDARD Mignonette is not grown to the extent it should be. Good plants are exceedingly enjoyable by their graceful appearance and fragrance, and they continue attractive for a very long time. Having had good experience in growing these plants I will endeavour to impart the details of culture that may be of service to some readers.

Sowing the Seeds.—For producing the best results some should have been sown three weeks or a month ago, but there is still time if no delay occurs for producing good plants. Prepare as many thumb pots as of plants required; sow three seeds in each in loam and leaf mould, and place in gentle heat to germinate. As soon as the seedlings appear watch carefully for any appearance of slugs, and to prevent their depredations shake soot or lime about their haunts. As soon as the plants are large enough to determine the strongest, draw out the others, leaving one plant only in each pot; keep them near the glass, and gradually increase the amount of air to harden and prepare them for a cold frame. I find Miles' Spiral a good variety to grow.

First Shift.—As soon as the seedlings are well rooted they should be transferred to 60's, using for a compost decayed leaf soil and fibrous loam in equal parts with a liberal quantity of sand. When turning the plants out be careful not to disturb the roots more than can be avoided, or the plants will experience a check; place a small stake to each and remove to a cold frame, where they should be kept close for a few days until established. A north aspect, behind a wall if practicable, will be found a suitable place for the frame, which should be filled to within 6 or 8 inches of the top with coal ashes, and as the plants grow the ashes can be lowered accordingly.

Side Shoots.—As the plants grow they will produce side shoots; these should be nipped off close to the stem. When the plants have reached a height of from 10 to 12 inches they will probably be ready for a shift into larger pots, 32's will be found a suitable size; have them quite clean, or the roots will adhere to the sides when turned out at their next shift. A small quantity of dissolved bones may with advantage be added to the soil, which otherwise should be the same as before. Always use it in as rough a state as is compatible with the size of pot. Keep the plants rather close for a few days until established, after which admit abundance of air. As soon as they have attained the desired height—i.e., from 18 inches to 2 feet, allow the top shoots to branch out, and when these require support place them on the trellises.

Final Potting.—In giving the final shift a difference in the compost will be necessary. Two parts loam, one of leaf soil, one of old Mushroom bed refuse, and an eighth of charcoal, with sufficient sand to keep the whole porous, will be suitable. I have heard it said if sand is used in quantity it will add to the fragrance of the flowers, but for the accuracy of this I cannot vouch. In placing on the trellises make them as firm as possible, pushing the stakes well through the soil. Ours are made of galvanised wire after the style of those used for Chrysanthemums, only the wires are placed much closer together. They range in size from 15 to 20 inches in diameter, 8 to 12 inches in depth, with stems from 2 to 3 feet in length. Pots 10 inches in diameter will be large enough; they should be well drained, as Mignonette is very impatient of too much moisture at the roots during the winter. Cover the potsherds with new leaves, or, better still, fragments of fibrous loam, with the fine soil shaken out; pot rather firmly, leaving an inch of space to allow for top-dressing. These are small matters, but essential for attaining success. As the growths extend stop and tie them down, regulating them so as to cover the trellises as evenly as possible. As the days shorten the plants must have a light, airy position near the glass. When they have overspread the trellises cease stopping, and allow them to flower. It will be found necessary to tie the shoots down once more to keep the plants compact and shapely. They will now derive benefit from a top-dressing of soil similar to that used in potting.

Summary.—Mignonette delights in a humid atmosphere during its early stages of growth, but as the weather becomes less dry the plants require less moisture, both at the roots and in the atmosphere, until the flowering period, when they will again require abundance of water. When flowering they are gross feeders, and are much benefited by occasional applications of liquid manure, or the surface of the soil sprinkled with Thomson's Vine manure or Standen's fertiliser, at intervals of eight or ten days. As seed pods appear they must be nipped off; this will prolong the flowering season.

Our plants last in bloom from the middle of February to the first week in June. They should be shaded from hot sun.—NIL DESPERANDUM.

DEATH OF MR. JOHN E. LANE.

THE name of Mr. John Edward Lane of Berkhamsted is one that has been long associated with the progress of horticulture in this country. The contemporary of Rivers, Loudon, Paxton, and many others, he had survived them all, and he, with Mr. Marnock and Mr. John Lee, was left the representative of an age anterior to our own. He now has passed away, having died on the evening of the 17th instant at Berkhamsted in the eighty-second year of his age.

Mr. Lane was born at Berkhamsted, where his father, Mr. Harvey Lane, had previously been a nurseryman. At an early age he exhibited an amount of business capacity and energy which soon began to tell upon the fortunes of what was at that time a thriving though modest country nursery and seed business. By his application to business, and the extent of his enterprise, the little town of Berkhamsted, which it was at that time, was soon too small to occupy the attention of one whose ideas expanded with his growth, and he soon succeeded in having himself associated with some of the large metropolitan houses. As a cultivator he was thoroughly practical, and the direction his mind took was in the study of ornamental trees and shrubs, of which Roses formed a very large part; he was for many years classed among the leading Rose-growers, and his nursery as one of the emporiums of the Rose trade. His name will be perpetuated in the Moss Rose Lanei, as well as in that useful fruit, the Apple, Lane's Prince Albert. Some years ago Mr. Lane acquired celebrity as a Grape-grower by the marvellous specimens of the Muscat of Alexandria with which he astonished the frequenters of horticultural shows at home and in many parts of the Continent. Mr. Lane was a man of kindly disposition, a fast friend, and generally highly esteemed.

PARIS GREEN FOR INSECTS.

PARIS green is an arseniate of copper, and London purple and Brunswick green as sold by our people, appear to be cheaper forms of the same article. It was first announced in the "American Gardeners' Monthly" as a perfect preservative against the Colorado Potato beetle, and it is now in general use.

The Colorado Potato beetle (*Doryphora decemlineata*) was one of the most terrible pests the vegetable grower ever had to contend with. In a week they would appear in such hordes as to eat every vestige of leaf from a hundred-acre Potato field. Its home is, or rather was, in the Rocky Mountain region, where it fed on *Solanum rostratum*, and other allies of the Potato native there. It could not cross the thousand mile desert between the Rocky Mountains and the Mississippi river. But when the railroad was carried across the desert in 1870 it took a free passage and stormed the Potato fields, and took to Egg Plants and other solanaceous plants. Many schemes have been introduced to apply the poison, but the plan in general use is to mix it with three-fourths, provided it has not already been adulterated, of ashes, dust, powdered lime, or any similar material, and sift it through any old tin vessel with holes, as in a cullender. The vessel is tied to a long pole, and the workman stands to windward, so that the poison will not blow in his eyes. It is sifted while the dew is on the foliage. It has saved many a thousand acres, and is often welcomed rather than feared. There would often be a glut, but the ignorant and careless lose their crops, while the "book-learn't"—as those who read are derisively called by the purely practical man—saves all his crop at little cost, and gets heavy prices for the tubers he saves.

Paris green is now used as a preservative against any insect that eats. Against such as suck, as in the class of aphides, it is useless. In trees out of reach of a man with a sifter, it is used in water, and applied by a pump or syringe. In many regions it is impossible to get an Apple for the codlin moth, or a Plum or Apricot for the curculio. Paris green syringed over the trees at an early stage effectually secures a crop. Sometimes rain falling soon after the application, a second, or even third dose is necessary.

Much opposition was made to its general introduction because of its poisonous character. Strange to say it is extremely rare to hear of any accident through its use. Everybody seems to know how to use it, just as they have learned how to use gunpowder. The Cabbage here suffers fearfully from the caterpillar (larvæ of *Pieris rapæ*), but I never heard of anyone using Paris green for its destruction, because all know that the Cabbage leaves would retain the poison.

London purple, the same I suppose as Brunswick green, is cheaper than Paris green, and is being freely used. It is a great blessing to the American farmer or gardener in any of these forms.—THOMAS MEEHAN, *Germantown Nurseries, Philadelphia, United States.*

[We have pleasure in publishing this article from our esteemed

correspondent, who is one of the world's most diligent workers in horticultural research. The information imparted will answer several inquiries on the subject to which it refers. Paris green, as Mr. Leonard Coates has informed us, is mixed at the rate of 1 lb. to 200 gallons of water in California, and at this strength destroys caterpillars on fruit trees without injuring the blossom.]

ORCHID NOTES. CATTLEYAS.

THIS genus would appear to be the most popular generally, and no wonder, seeing what a number of gorgeous species there are, and how freely they flower. Being imported in large quantities all the commoner forms can be bought at a comparatively cheap rate, and if a judicious collection is made, and the plants fairly well cultivated, the enthusiast with limited means even may have something to gladden his eyes at almost any time of the year. We have had a few flowers of *C. Trianae* at different times from November to May; next came the beautiful *C. Mossiae* and the showy *C. Mendelli*, these being followed by *C. Warneri*, *C. Skinneri*, and *C. intermedia*. Towards the end of July *C. Gaskelliana* is available, and those who require good exhibition Orchids early in August ought to cultivate several plants of this, the best in the labiata section, and also *C. crispa* and *C. Loddigesii*, the last named being the more durable and serviceable. The true *C. labiata* flowers in the autumn, but some of the forms are in bloom much earlier. The fine *C. maxima* is usually in flower during November and December, and *C. dolosa* is also a good late-flowering species. To the foregoing might well be added the beautiful *C. Dowiana*, which is useful for the August shows, and *C. Bowringiana* is of free growth and is a beautiful flower. The foregoing by no means exhausts the list, and there are many very beautiful varieties in each section some of which may well be added when the novice has mastered the few cultural details to be observed in their treatment, and is also sufficiently advanced in Orchid lore to fully appreciate the points of merit in the flowers.

CULTURE.

When a house can be devoted principally to Cattleyas, this being well furnished with high stages and good side benches, then it is advisable to keep the bulk of the plants either in ordinary pots, or, better still, perforated pots and pans. Where, however, they have to be grown in a mixed plant stove, then I prefer them in baskets or pans suspended near the roof. The deep pots especially ought to be half filled with drainage, and in every case the compost should consist of good roughly broken fibrous peat and an equal quantity of charcoal and crocks. Being fixed well on the surface of this, and not mossed over in any way, the roots soon ramble over and through it, and all the time it remains in a sweet state they will, other conditions being favourable, thrive most satisfactorily. Any at the present mere subsisting in a mass of sour compost—and there are many in this bad plight—ought to be taken in hand at once, and partial recovery may take place this summer. If the drainage is choked then must a completely fresh start be made, but if clean and abundant the safest and best procedure is to pick away the sour soil from the roots and renew with perfectly fresh compost. A very high temperature at this time of year, or say such as *Allamandas*, *Ixoras*, and *Crotons* delight in, is simply ruinous to Cattleyas, and this we once found out to our cost. Plants, both suspended in baskets and shelves in pots, all rooting strongly and growing freely, suddenly came to a standstill, and the roots soon decayed badly—they had been cooked in fact. The greater portion of the plants were removed to a cooler house, or what is more properly a fernery, the temperature of which ranges from 65° to 75° by day and fully 10° lower by night, and in about a fortnight root action recommenced, and the old happy state of affairs was soon restored. A moderate amount rather than a dense shade best suits Cattleyas during the hottest part of the year, and the pots should be well watered, and the baskets dipped as often as found dry. In the autumn much more light and less moisture is needed, but, unlike the *Dendrobiums*, Cattleyas, with but few exceptions, one of these being *C. Skinneri*, do not require to be baked—that is to say, severely ripened.

SOFT WATER FOR ORCHIDS.

A good supply of soft water is of inestimable value to the Orchid grower; in fact, it is one of the most important aids to

success. Those, therefore, who are fortunate in having one or more large soft-water tanks in their Orchid houses ought at this time of year especially to carefully husband their supply, as it may be some time before any appreciable quantity of rain water falls. It should be used for watering and syringing Orchids only, and not a drop ought to be wasted either in damping down or washing the floors of the houses. Soft water is, so to speak, both meat and drink to the roots, and when always available no manure of any kind should ever be used. Being stored in the house, if possible above the level, and not covered in closely (stages may be fixed over it with advantage) the water does not become hard, as it is liable to do in covered tanks, and it is also of much the same temperature as the house, therefore fit for use without adding heated water. Nothing can well be worse for choice plants than water drawn from hot-water pipes, and if it is at any time necessary to raise the temperature of water to be used add water heated in a copper in a copper or kettle. There is no injurious vapour arising from open tanks, but, on the contrary, they serve to purify the atmosphere. Small tanks over hot-water pipes are of good service in an Orchid house, and it is over these where the *Phalænopsis* are most at home.—I. M. H.

GARDENERS' ORPHAN FUND.

ELECTION OF CHILDREN AND ANNUAL DINNER.

THE annual general meeting of this Charity was held at the Cannon Street Hotel on Friday last, when the report and recommendations of the Executive Committee were adopted, six children elected to participate in the benefits of the Fund, and the annual dinner subsequently celebrated. This was a greater success than the most sanguine expected, and the only incident that caused a little momentary disappointment was a number of visitors, whose acceptances had not been received at the appointed time, arriving late and finding the tables filled; thus an overflow dinner was a necessity, but subsequently room was found for all, and the proceedings were of the happiest character throughout. The magnificent and unrivalled Kentias of Messrs. Wills & Seager imparted a tropical appearance, and these with the beautiful floral decorations of friends mentioned below, and a bountiful dessert supplied gratuitously by Mr. Munro of Covent Garden, and other willing helpers, furnished the noble room in the most satisfactory manner. The speeches delivered received, as they deserved, the best reception. Miss Marie Belval and her assistant vocalists enlivened the proceedings, and, as a climax to the event, and on the generous initiative of Mr. Harry J. Veitch, the dinner will result in a gain of £200 to the charity, and the possible addition of two more children to participate in its benefits.

REPORT AND FINANCIAL STATEMENT.

The following is the report of the Executive Committee presented to and adopted by the meeting, with the financial statement appended:—

In presenting their second annual report the Executive Committee desire to record their high appreciation of the support that has been accorded to the charity in various ways during the past year.

They would also particularly express thankfulness in having been enabled during the same period to dispense the means of support to a number of children, who, but for the assistance thus granted, would have suffered privations which it is felt that no orphan child of a British gardener should endure. Experience has brought home to the minds of the Committee, more forcibly than ever, the pressing need that exists for a strong fund to meet the urgent claims made upon them.

It is impossible adequately to represent to the subscribers the profound expressions of gratitude received from widows of gardeners, and other relatives of the children who were last year elected to participate in the benefits of the Fund.

It will be remembered that at the first annual meeting six candidates were elected by the votes of the subscribers, and that subsequently, owing to the satisfactory character of the financial statement then presented, the Committee felt justified in placing the four unsuccessful candidates on the Fund also. Shortly afterwards, through the generosity of Mr. N. N. Sherwood, who placed the sum of £100 at the disposal of the Committee, yet another child was placed on the Fund—making eleven in all who now participate in its benefits, as a result of the first year's work.

The Committee desire to express their deep obligations to His Grace the Duke of Bedford for the use of the flower market in Covent Garden for the purpose of holding the second evening fête, which was as beautiful a floral spectacle as it was beneficial to the object it was designed to assist, the amount derived on the occasion being over £200. Grateful thanks are tendered to the Baroness Burdett Coutts who so kindly opened the Exhibition, to the standholders who so freely contributed the plants and flowers, and to all who assisted in rendering the fête such a gratifying success.

To His Grace the Duke of Marlborough the best thanks of the Committee are tendered for opening the famed gardens of Blenheim at an appropriate time on behalf of the Fund, and to His Grace's gardener, Mr. T. Whillans, for his willing and effective co-operation. The amount raised by this means was £73.

The Committee are also greatly indebted to Mr. D. T. Fish, Hardwicke House Gardens, Bury St. Edmunds; Mr. Owen Thomas, Chatsworth; Mr. H. B. May, Edmonton; Mr. W. Wildsmith, Heckfield Place; Mr. A. Dean, Bedford, and others, who, in their respective districts organised entertainments in aid of the Fund, which resulted in sums of substantial value being raised. To the many friends who have undertaken the duties of local Secretaries the Committee desire to express appreciative thanks for the valuable services they have rendered, and among them they would specially mention Mr. J. Hughes of Birmingham, who by means of collecting boxes has obtained a considerable amount in small sums.

To the gardening press the Committee record their great obligations for valued support; also to Mr. John Fraser, Lea Bridge, and Mr. W. Sharp, for auditing the accounts, a statement of which is herewith presented.

Acting on the advice of Mr. A. H. Smee, one of the Trustees, and having regard to the stability of the Fund, the Committee regret being unable to recommend the election on this occasion of more than five children out of fourteen applications; and it is felt that this fact affords the strongest appeal for further aid for the succour of helpless children. Through the munificent gift of £500 by the Duke of Bedford, the Committee have great pleasure in announcing that a sixth child will this day be placed on the Fund.

Mr. George Gordon, of Gunnersbury, has been elected a member of the Committee in the place of the late Mr. Howe (an earnest worker in the interest of the Fund, whose death is much regretted), and Mr. F. Q. Lane, of Great Berkhamstead, in the place of Mr. H. Williams, resigned. The members of the Executive Committee who retire, according to the rules, are Messrs. Cannell, Goldring, Head, Laing, Nicholson, Penny, Poupert, and Roberts, who are recommended for re-election. The retiring Auditor, Mr. W. Sharp; the Treasurer, Mr. T. B. Haywood; and the Hon. Secretary, Mr. A. F. Barron, are also nominated for re-election.

The Committee venture earnestly and respectfully to present the claims of the Gardeners' Orphan Fund to the consideration of all who derive pleasure from or are engaged in horticultural pursuits, and will be thankful for the employment of such means as can be devised for according it the support that is needed for carrying out its beneficent work.

THE ELECTION.

The counting of the votes recorded in favour of the several candidates had the following result:—

	Votes.
Bessie Taylor, aged two years	237
Arthur John Ireland, aged six years	233
Edmund Walker Mosedale, aged three years	151
William Charles Allen, aged five years	133
David George Guthrie, aged two years	108
Harry Robinson Preston, aged one and half year	103.

The next in order who will possibly be placed on the funds were—

Robert James Todd, aged eight years	92
Olive Chapelow, aged four years	87

The votes recorded for the remaining candidates will be placed to their credit for the next election.

THE DINNER.

At this, the second anniversary dinner, Sir Julian Goldsmid, Bart., M.P., the President of the Institution, occupied the chair. A numerous company assembled, including Dr. M. T. Masters, Messrs. Shirley Hibberd, G. Deal (Chairman of the Executive Committee), A. H. Smee (Trustee), H. J. Veitch, and H. M. Pollett (Vice-Presidents), A. F. Barron (Hon. Secretary), D. T. Fish (Hardwicke), J. R. Bourne, A. W. G. Weeks, John Wills, F. Seagar, John Laing, H. Turner, J. Cutbush, J. Smith (Mentmore), A. Dean, R. Dean, Jesse Willard, T. A. Dickson, J. Assbee, H. B. May, J. Hudson, Alderman Hardy (Chiswick), C. H. Sharman, H. Cannell, most of the members of the Committee, a strong contingent of gardeners and growers for market, the total number present being about 170 persons.

After the loyal toasts, which were given from the chair,

The PRESIDENT proposed the toast of the evening "The Gardeners' Orphan Fund." He said that the Gardeners' Orphan Fund was now one of the well-established charitable institutions of England. (Cheers.) In order to test that, it was desirable to call attention to the accounts. He found that last year their total receipts were £1820, and the balance which they brought forward was £600. (Cheers.) As the result of that year they were able to invest £1000 in Government stock. On looking to the balance-sheet now presented he found that they had £2525 invested, an increase on the year of £1500. The first year they were able to invest £1000, the second year £1500, and obviously next year they must invest £2000. (Laughter and cheers.) Well, if they went on at that rate, the time would soon come to which he looked forward with satisfaction, when they would have funds of at least £10,000 invested. He should like that to be the case, for the reason that they were rapidly increasing the number of recipients of their charity, and there could be nothing better than that the income necessary for the orphans should come from the invested funds. Last year they allowed the orphans £139 15s. They must go on and largely increase that amount, for the reason that they had elected six more recipients of the Fund in addition to the eleven elected last year. When he told them that those six were elected from a very much larger number of candidates, by that simple fact he proved the necessity which existed for founding the Fund. The growers and standholders at Covent Garden had this year, for the second time, given a great fête in that magnificent building which belonged to the Duke of Bedford, and the result of that splendid fête was that they drew the attention of the Duke of Bedford more clearly and distinctly to the work which they had undertaken, and he gave to them a sum of £500 to invest in the Fund. (Cheers.) While expressing their thanks to the growers and standholders for work which they did they had the greatest encouragement to go on and do the same thing for the future year, because it produced results of the most satisfactory character to the funds of the institution. Now in another way this was agreeable to the Treasurer, because, for the first time when they charged 5s. for the tickets the sum realised was £314, and the expenses of the fête, owing to the kind assistance of the growers, only amounted to £114. The result was that the Fund benefited to the extent of £200 out of the admissions. That, he thought, must be a great encouragement to the energetic members of the Committee, and if he was to single out any two more than others as having worked hard in this matter, he would mention Mr. Deal and Mr. Barron. (Cheers.) He thought they (the subscribers) had struck a chord which had resounded in the heart of every man interested in the rising generation. Gardeners, like other men, had wives and families, and, like other men, they some time or other met with misfortune, and it must gladden their hearts to know that there was a fund from which their children, if they were unfortunately bereft of the assistance of their parents, might obtain sufficient to enable them to live. (Hear, hear.) They would gladly increase the number of recipients of the Fund, and they trusted that from year to year that would be done by the Committee. Now it was hardly necessary or desirable that he should point out to them, who knew more about it than he did, how much devolved upon the gardeners. His charming neighbour to his left (Mr. Shirley Hibberd) told him that half an hour before he had begun a discussion with someone on beauty. "What is beauty?" was the point which he and his neighbour considered. He agreed that if they were to pursue the discussion, not only would the remainder of the evening not suffice, but the remainder of the week would be inadequate for it. So far as it went he might say that if there was any profession which promoted and increased the love of beauty, the admiration of everything that was beautiful, it was surely the gardeners' profession, because any man who devoted

himself to any particular branch of that profession was quite sure to find out things which in themselves had new beauties which he could appreciate. Mr. Shirley Hibberd, for instance, had worked hard for years at the cultivation of Ivy. When he told them that there were a hundred varieties, and that recently Mr. Shirley Hibberd had discovered a Golden Ivy, he thought they would see that even with that neglected plant there was very much to be done. (Hear, hear.) Why he had mentioned that was this, he thought that every gardener ought more or less to strike out if possible a particular line for himself, because it was evident they had not come to the end of the knowledge which was to be obtained with regard to the many varieties of plants and fruit with which they had to deal. He was quite satisfied that if each one of them would make up his mind to devote himself to one particular point, in the end he might obtain very useful information and most satisfactory results. (Hear, hear.) He could give many examples of this, because they all knew that fresh varieties of fruit, for instance, had been produced by working gardeners, and many other things might be found out if they devoted their attention to a particular branch of industry. No man ought to consider himself too low to improve the profession to which he belonged. (Cheers.) Perhaps they would say that that had very little to do with the Gardeners' Orphan Fund. But it had to do with it in this way. It was obvious that if a man had originality and enterprise, that the possibility was that by finding out something he would improve his own position, and then instead of running the risk when he died of having his children thrown upon the Orphan's Fund he would probably be a large contributor to the Fund himself. That was an important matter, and it was for this reason that he had mentioned it. It was quite certain that they had shown by their attendance there their interest in this Fund. They knew as well as he did the advantages which it offered to those placed upon it, and they ought to do all in their power to encourage the Committee in the useful work which they had undertaken. It was with these views and these sentiments that he proposed to them "Success to the Gardeners' Orphan Fund." (Cheers.)

Mr. G. DEAL, in responding, said that as spokesman of the Committee of the Institution he returned Sir Julian and those present the warmest thanks for the manner in which the toast had been proposed and received. With regard to the Gardeners' Orphan Fund he was delighted to inform them that their success during the past year had exceeded even that of the previous year. It was predicted that the Fund having been established as a Jubilee Fund, they might expect that the first year their contributions would exceed those that would follow. He was delighted to inform them that the very contrary had been the case. They had touched the spring of love in the hearts of gardeners towards the orphan. (Cheers.) It seemed to him that in 1887-8 they had only sown seed that was to bring forth greater, better, and riper fruit in the year 1889. (Cheers.) In the twelve months 1888-9 they had had contributions exceeding those of the fifteen months of 1887-8. He took that as great evidence of the fact that the Gardeners' Orphan Fund was thought to be a desirable institution, and that they were anxious to do their duty to the orphans of the less fortunate members of their fraternity. (Cheers.) On behalf of the Committee he thanked the subscribers for the splendid manner in which they had come forward and contributed. (Cheers.) Although he agreed with the suggestion of their distinguished Chairman that it would be well to establish a Fund of £10,000, he thought there was such a future in store for the Gardeners' Orphan Fund as would justify them in electing a larger number of children annually upon a smaller sum. The case was different to that of an insurance office, where they hardly knew the length of time to which some people might live. In the Gardeners' Orphan Fund there was the limit of age of fourteen years, and therefore the Committee were in hopes that even with the present influx of capital they might at some future time be enabled to elect a greater number of children *pro rata* than they had hitherto done. If similar success awaited them in the future to that which had attended them in the past then they had a splendid future before them. The tree which they had planted in the jubilee year would by-and-by shed forth large branches, and take under its shelter the orphans of gardeners who had borne the heat of the day. (Cheers.) He now had to propose a toast which he was sure would meet with a hearty reception. It was the health of their President, Sir Julian Goldsmid. (Cheers.) To him they were deeply indebted for the success of that movement, and he thought they were particularly fortunate in having so able and so distinguished a President. He wished to embellish the toast with a little feminine adornment. It had been their good fortune by the generosity of the Duke of Bedford, backed up by the Covent Garden growers and standholders, to hold floral fêtes in aid of the institution, and the great magnet of attraction there was Lady Goldsmid. (Cheers.) He hoped they might have her presence on many future occasions, and as they were so much indebted to her for her interest in the fête, he begged to couple her name with the toast. (Cheers.)

The CHAIRMAN briefly returned thanks, and said that Lady Goldsmid was very glad indeed to attend the Floral Fête. He had great pleasure in attending that dinner, and he was most grateful for the kindly way in which they had received the toast. (Cheers.)

Mr. VEITCH proposed "Gardeners and Gardening." He said he was pleased to see such a numerous company, and he thought it augured well for the future of the Gardeners' Orphan Fund. In asking them to drink this toast he had the pleasure of coupling with it the name of Mr. D. T. Fish, than whom no one was better known, and no one could be selected more representative of the gardening fraternity of Great

Britain. (Cheers.) The only point that he would speak about was the liberality with which gardeners had come forward in support of the Fund. They saw by the list of children elected last year that no fewer than ten candidates were placed on the list, in addition to one who was put on in connection with the Sherwood trust. That spoke volumes for the success of the institution. To-day they had the satisfaction of putting on five more in the regular way, and another in consequence of the munificent donation of the Duke of Bedford. With the additional candidate elected that made only six as against eleven of last year. He did not like to see the number less than last year. He thought that Mr. Sherwood had given them a lead which should be followed. He was anxious to follow his friend Mr. Sherwood on certain conditions. He found from the Chairman of the Committee, Mr. Deal, that £100 would put a child on the list and keep him until fourteen years of age, and if those present would find £100 to put on a candidate, he would find £100 to put on another candidate. (Cheers.) They could not afford to let too many orphans be waiting for their generosity. They had elected six that day, and they had eight who were not elected. When would their next election be? They could not tell at present, therefore he asked them earnestly to provide the £100, on condition of which he would provide £100 himself within three months from that time. He knew that there were gardeners to whom every shilling was of consequence; at the same time he urged them to make a special effort in this matter. He thought they might congratulate themselves that, considering their position in the world, there was no more liberal body of men in existence than gardeners were, and what they had done in the past justified the statement. (Cheers.)

The PRESIDENT said he trusted they would support Mr. Veitch. It would be well for them to get another £100, and towards that he proposed himself to send to Mr. Deal the sum of £25. (Cheers.) He apologised for having to leave to fulfil another engagement, and asked Mr. Shirley Hibberd to take his place.

Sir Julian Goldsmid then left the hall amidst cheers, and the chair for the remainder of the evening was occupied by Mr. Shirley Hibberd, who on taking this position said they had lost a good shilling and had got a bad sixpence. (Laughter.) He should get out of the difficulty by asking Mr. Fish to illuminate them—to bring some phosphorescence from the sea. (Laughter and cheers.)

Mr. FISH then rose to respond to the toast. He said the report which they had heard of their progress had been a most cheering report. He thanked Mr. Veitch for associating his name with the toast, which he considered almost the toast of the evening. They knew how humble the gardeners of England were. It could not be otherwise. No man could have sat at the feet of Nature for the number of years that he had and not have learnt the first lesson which it taught—that of humility. (Cheers.) He was reminded before he came to London that it was a curious place, and they would be able to tell him whether it was true or not; but it was said that one of the first effects of London was to melt down all individual cleverness into one great lump of cleverness. He believed there was a good deal of cleverness there that night, but he did not think that London had had the effect which was attributed to it in their case. They certainly had had one distinguished lump of cleverness, and something better—of goodness—in their Chairman who had just left. (Cheers.) There was a good deal of originality about gardeners, who were never content with their present attainments. They were always reaching forth to something better. He was much pleased with the suggestion of Sir Julian that each one should strike out some new path as the way to pleasure and wealth. Now he (the speaker) had been trying to strike out new paths all his life. They had led to a great deal of pleasure, interest, enjoyment and happiness, but the one thing they had not led to yet was wealth. (Laughter.) The fact was, gardeners had to take their wages in beauty. (Laughter and cheers.) That was one of the chief reasons why they wanted this Orphan Fund. It was because, work as they would, do what they might, improve their business and themselves as they would, the one thing, wealth, was not attained. One thing, however, they had accomplished. In starting their Orphan Fund they had succeeded in linking beauty with beneficence. (Cheers.) It used to be said that time and tide wait for no man, but in Covent Garden Market the power of their little orphans had been such that they had succeeded in arresting the progress of beauty from the producers to the consumers just long enough to allow them to get £200 out of it. (Cheers.) Beauty, like mercy, was twice—aye, many times—blessed. The plants were more beautiful and the flowers more beautiful and fragrant after they had exacted contributions for their helpless orphans. (Cheers.) Up and down the country their example with reference to the Floral Fête was being followed. If there were any who were hesitating as to whether they should follow the example of the President he begged of them not to hesitate any longer, but to make a strong effort on behalf of the orphans, and in due time they would be sure to meet with their reward. He could not sit down without saying a word or two about gardeners and gardening. Gardeners found the earth a wilderness, and they were fast making it a garden of Eden. With reference to the future of gardening he contended that it had no limits and no bounds. Talk about finality, they knew nothing of it in horticulture. Gardeners who had done most were the readiest to tell them that they seemed like little children picking up pebbles on the sand while the great ocean of truth lay all unexplored. With the knowledge which their horticultural press was spreading broadcast around them they could not now have any stupid gardeners. He feared that their brothers of the knife and spade would be entirely driven off the course by their brothers of the pen; they were

so wise and far-seeing, they could do the work so easily on paper. (Laughter and cheers.) He himself found it much easier to garden on paper than at his own home. (Laughter.) He believed there was a great future before gardeners, and they were only just beginning the great art of horticulture.

Mr. A. DEAN proposed "The Vice-Presidents, Trustees, and Auditors." He said that one of the speakers had referred to the six children who had been elected to the benefits of the Orphan Fund, and he (Mr. Dean) had thought of the feeling of disappointment that would be experienced by unsuccessful candidates. Mr. Veitch had made a magnificent lead, and could not the other sixteen gentlemen who were associated with him, and included in the toast, make up the other £100? The President had also made a generous offer, and he trusted that others would follow his example. (Cheers.)

Dr. MASTERS, who acknowledged the toast, said that from a list placed in his hands there had already been a liberal response made to the appeal that had been addressed to them, and amongst those down in the list were Messrs. Wills, Pollett, Gaymer, Shirley Hibberd, Dr. Masters, and Alderman Hardy. (Cheers.)

The CHAIRMAN then proposed "The Committee and Officers of the Board." He said that Mr. Veitch's proposal would come before them as a matter of business. It had been suggested that each of the Vice-Presidents should subscribe £10 each, but they could not measure another man's corn by their own bushel. (Hear, hear, and laughter.) He should be glad to contribute £5 to the Fund. (Cheers.) The officers had had a tremendous task set before them, and it was not yet accomplished; but what they had done was a matter of surprise no less than of delight. (Cheers.) He had not in his time seen any movement pushed along with such steadiness and energy as this had been. It was a significant fact that when a proposal had been made to gardeners for their own benefit they had been indifferent; but when something was proposed in which they had no personal interest, from which the element of selfishness was entirely eliminated, then they found them putting their shoulders to the wheel and accomplishing most wonderful things. No man there would derive the slightest advantage from the Fund; they were moved by the demand made upon their sympathies by the young and tender who could not help themselves. (Cheers.) He had not seen in his time so magnificent an example of unselfishness in a great public movement as in the Orphan Fund. He knew that there were many such institutions, but the point that seemed particularly interesting was that the gardeners who had not been particularly careful about themselves were careful, thoughtful, and energetic in the interest of these orphans. (Hear, hear.) They hoped that the orphans in need of assistance would decrease rather than increase, that horticulture would have such a position that every man who practised it would be able to provide for his children so that they would not come upon any fund whatever beyond his own fund. (Hear, hear.) That was their hope, and it was not a vain hope, for this country was rich, and was growing richer. The gardener was in a peculiar position. He did not earn much, he had no chance of becoming rich except by some accident; but between him and his work there was a beautiful sympathy which rendered his industry a most solid, substantial, and promising thing. He could understand an engineer loving his engine, he could not understand an undertaker loving his work. (Laughter.) They might pass through various occupations of men and see how much many of them must be tried in connection with their daily duties. Some of them had painful and horrible tasks, and in some cases tasks which were detrimental to health and morals. In the gardeners' case it was different. In 999 cases out of 1000 he loved his work, and was in sympathy with it. He loved it more than his wages. (Laughter.) Mr. Fish had said it was very pretty to do gardening on paper; but they had to do it on paper, and Mr. Fish forgot for a moment that he had spoiled more paper than any man who had ever lived. (Laughter.) Another feature that was noteworthy was the wonderful sympathy that was cultivated between the gardener and his employer. He did not mean to say that gardeners were angels—(laughter)—but he was astonished to find that amongst criminals gardeners had no place. (Hear, hear.) They did not come out with distinguished honours in the Newgate Calendar. (Laughter and cheers.) The management of the Fund derived considerable advantage from that circumstance. All the Committee and officers had been trained in the practical school of business. From the first they had had the assistance of Mr. Deal. They wanted in the first instance a man of business. They found Mr. Deal, and they were wise enough to make use of him. (Hear, hear.) Step by step the Fund had grown to its present proportions, and certainly the management must have very much of the credit. Some things succeeded by a fluke—he did not know exactly what that was—but this institution had not succeeded by a fluke. This success was brought about by systematic, honest, steady work. He should ask Mr. Deal and Mr. Barron to respond. They were two gentlemen who had brought the Fund to its present proportions. (Cheers.)

Mr. G. DEAL, who first responded, referred to the careful manner in which the Committee had worked in the interests of the Fund. A great deal of the success of the Fund was due to the indefatigable energy of the local Secretaries throughout the country in obtaining supporters. Amongst those who had rendered special assistance was the gardener to the Duke of Marlborough, Messrs. Hughes of Birmingham, D. T. Fish, Cummins, Wordsworth, Scott, Thomas, Greenfield, Head, Wood, Ward, Wilkins, and others. He only trusted that the zeal which had been shown on the part of those gentlemen would not flag. (Cheers.)

Mr. BARRON, in responding, said he was not a little proud of his position as Secretary to the Gardeners' Orphan Fund. So long as they continued to repose confidence in him, so long would he continue to work in promoting the interests of the Fund. He had received from all parts of the country expressions of gratitude from those who were participants in the benefits of the Fund, and great encouragement from others who interested themselves in its welfare. (Cheers.)

Mr. A. SMEE next gave "The Local Secretaries." In the course of his remarks he said that in the Jubilee year they planted a Vine. It was a gardening axiom that they should not overcrop a young Vine, but a Vine required nutriment, and in answer to the appeal which Mr. Veitch had made he should be happy to subscribe £5 towards growing one bunch of Grapes. (Cheers.)

Mr. SHARMAN replied, and testified, as one of the Executive Committee, to the excellent work which local secretaries were doing generally throughout the country. (Cheers.) They were most disinterested and unselfish in their operations. The Chairman would excuse him if he mentioned that the Institution originated to a great extent from the suggestion of Mr. Penny. (Cheers.)

The CHAIRMAN stated that Messrs. Lane & Sons had promised £5. He then proposed "The Visitors."

Alderman HARDY, who first responded, referred to annual subscriptions as being more acceptable than donations. He announced his willingness to give a donation of five guineas, and an annual subscription of a guinea. (Cheers.)

Mr. BOURNE, who also replied, said it was gratifying to find that the Fund was making such progress—(hear, hear). Many of such movements often bubbled up and ended in bubble, but that Fund was certainly taking good hold in the gardening profession. He felt a great desire to see the Fund placed on a permanent basis. He thought they should endeavour to get a capital fund. They should endeavour to get such a fund, that if at any time there was a falling off in the subscriptions the pressure would not be felt by the Committee, and they should continue to meet any demands that were made upon them. For that reason he felt anxious that there should be an effort made to get a permanent fund. It was with that view that the nobleman whom he represented had given a large donation. His was to encourage others to do likewise, in order to establish a permanent fund for the gardeners' orphans. (Cheers.)

Mr. R. DEAN proposed the health of those who had generously furnished the plants, fruit, and flowers with which the room was beautifully decorated. (Cheers.)

Mr. JOHN WILLS acknowledged the toast, and in the course of his remarks said it was surprising to him to see what marvellous strides the Fund had made in the two years. He did not think they would find in the records of any other society such an instance of success. (Cheers.)

The CHAIRMAN said they were indebted to Messrs. Wills and Segar, Laing, Cutbush, B. S. Williams, Sander (of St. Alban's), and others for the plants, fruit, and flowers. (Cheers.)

Mr. ASSBEE proposed "The Horticultural Press," to the representatives of which he said a large share of the success attained was due.

Mr. J. WRIGHT replied. He said that the proprietors of the Horticultural Press took a warm interest in the welfare of the Fund, and hoped the conductors had not neglected any opportunity afforded them of advancing its interests. (Cheers.)

It was announced by Mr. DEAL that £66 had been subscribed towards the second £100 in respect of which Mr. Veitch had made an appeal.

The proceedings terminated with a vote of thanks to the Chairman.

CHRYSANTHEMUMS IN LEICESTER AND NEIGHBOURHOOD.

VERY keen is the interest, rivalry, and enthusiasm felt and being shown in the culture of the plants during the present season by the more active members of the Leicester and Midland Counties Chrysanthemum Society. This is mainly due to the spirited action of the Committee at the commencement of the present season in firstly framing and adopting a most liberal and attractive schedule of prizes for the coming November show (far ahead of anything the Society has previously done in the same way). Secondly, in securing the Temperance Hall, the best public building in the town for such a purpose; and, thirdly, in engaging as judges two of our best known and most esteemed of "Mum" experts, Messrs. Wright and Holmes. Having during the past week had an opportunity of visiting a few of the principal growers and inspecting their plants it has occurred to me that a few notes would be of interest to growers and exhibitors in other districts who are readers of the Journal, and some of whom it is hoped will be competitors at the Leicester Exhibition.

MESSRS. LOFLEY AND ANTHONY'S PLANTS.

These gentlemen (uncle and nephew) are amateur growers, residing and working together at South Knighton, Leicester. Their collection

of plants consists of about 300, and is exclusively confined to the best known exhibition varieties. The incurved section is that which receives most favour at the hands of the elder Mr. Lofley, whilst the Japanese varieties are the especial favourites of the younger, Mr. Anthony. A pleasant mutual agreement, therefore, between them is, that whilst both work together to one end, each takes charge of his own favourite section.

As a proof that they are no tyros in Chrysanthemum culture I may state that Mr. Anthony was successful in carrying off the Veitch Memorial medal for twenty-four blooms, Japanese, at the last show of the Hull and East Riding Society in a very strong competition against well known first class growers, and hopes again to enter the lists as a competitor at the next show of the same society. The whole of his and Mr. Lofley's plants are in the best possible condition, strong, without being gross, the wood apparently ripening well, the foliage large and stout and of a most healthy dark green colour, reaching down to the pot, even Mrs. H. Cannell, which with most growers quickly loses its lower leaves, as represented here by several very strong plants is as vigorous as the others and shows none of that, its usual propensity. The Japanese varieties are mostly tall, many being already 6 to 7 feet in height, grown on the natural system, unstopped in any way. They are arranged in rows, given plenty of space for the admission of sun and air both in and between the rows, the growths all trained separately to upright builders' laths, which are again fastened to strong slaters' laths to stout sawn stakes driven into the ground.

An excellent arrangement here adopted for providing free drainage and preventing the plants rooting through into the ground below is the affixing of long boards about 2½ inches wide and half an inch thick on edge at about 3 inches apart, and standing the pots thereon, thus keeping them clear of earth and ensuring free ventilation all around and underneath.

A common difficulty with this, as with all collections I have this season visited, is the showing of premature buds, and from present appearances it would seem likely that the best crown buds of many varieties will be produced too early for the principal shows. Especially is this the case with such varieties as Mrs. J. Wright, Edwin Molyneux, Mdlle. Lacroix, Mdlle. Louise Leroy, Comte de Germiny, and others. The first named variety is here, as in most of the collections I have this season seen, unusually strong and fine-looking. Last season the opposite was the case, and at few shows was it well staged. This year it promises to come out in fine character generally.

BARKBY HALL.

At this fine old place, which is deserving of a more extended notice (the proprietor, T. W. Brooks, Esq., being an ardent lover and supporter of horticulture and of floriculture, and being most ably seconded in this by his skilful gardener, Mr. Landsell), Roses and Chrysanthemums are grown as specialties. Of the latter about 200 are grown in the most approved exhibition form, and are very strong, many of them also being remarkably short-jointed and dwarf with large strong foliage covering the pot surface. No topping or cutting back is practised, nor apparently, owing to the generally short-jointed growth made, is it here needful or advisable. The pots are plunged to about one-third of their depth, mainly with the object of preventing them being blown over and broken during high winds. Mr. Landsell has been for some years past an exhibitor and prizewinner at past Leicester shows. That he may long continue to be such is the wish of myself and most of those with me share his acquaintance.

STONELEIGH, BARKBY.

Mr. W. Billson, the proprietor, has for some years been a very successful grower and exhibitor at home and abroad. His collection comprises about 700 plants, most of which are very strong and in promising condition, providing the plants can be sufficiently ripened. They are somewhat too crowded owing to the large number grown, and the space available for standing them upon being limited. Mr. Billson's name will figure prominently at more than one leading show in November next. The greenhouses at his disposal for flowering the plants, being light, airy, and commodious, are simply perfection for the purpose.

MR. H. JORDAN'S COLLECTION.

Lansdowne Road, Aylstone Park, is the address of this grower, who is a prominent supporter of the Leicester Society and a member of its Committee. He is an earnest and successful amateur cultivator, growing about 200 plants of the best and most recent varieties. The plants in this collection are almost throughout remarkable for their dwarf and sturdy growth, stout hardy stems and large healthy foliage reaching in most cases down to the pot. Sunflower (new yellow Japanese) is here remarkably strong with large leaves, each nearly a foot in length; Etoile de Lyon and Mdle. Louise Leroy are also very robust and strong. A notable feature in Mr. Jordan's practice is the mixture of a considerable proportion of common salt in all the potting compost he uses, sufficient to destroy all earthworms therein contained, and to this he mainly attributes the unusual dwarf, sturdy character of his plants. He is of opinion, formed from several years of experiments amongst various kinds of plants, that salt has a direct tendency to produce short jointed growth.

Another novel and commendable feature in Mr. Jordan's practice is his system of summer training, which differs from what I have at any time seen elsewhere. Three stakes are thrust into the pot around the sides, forming a triangle, and of a height to which it is believed the growths will attain. The plants are then arranged in lines as usual.

Along the back side of the line of pots stout pointed stakes are driven into the ground, and a strong longitudinal lath fastened to these at about 3 feet 6 inches high. Also on a level with these are iron brackets screwed to the upright stakes and projecting horizontally sufficiently far to carry another longitudinal lath parallel with the first, and about 9 inches therefrom. To these two laths then are all the stakes tied. The advantages claimed for the system are—firstly, the more equable diffusion of air and light around each branch; and, secondly, that much time and trouble are saved at the time of housing the plants, nothing farther being then required besides cutting the ties attaching the stakes to the laths and carrying the plants indoors.

Mr. Reed, the energetic and respected Secretary of the L. and M.C.C. Society, lives next door to Mr. Jordan, and also grows about 200 plants, using the same compost, salt, &c., as does that gentleman. He, too, is equally a strong believer in the value of salt for the purposes named above. His plants, partly grown as cut-backs and part natural grown, are promising to produce some good flowers. They are not, however, yet so strong as are Mr. Jordan's.—W. K. W., *Syston*.

LILIUM PARVUM.

ONE of the most attractive of the small-flowered Lilies is the Californian *Lilium parvum*, regarded by Mr. Baker in his synopsis of

FIG. 8.—LILIUM PARVUM.

the genus as a variety of *L. canadense*, under which also are grouped *L. Walkeri* and *L. parviflorum*. It has stems usually 2 feet high, but when very strong it sometimes greatly exceeds that height, though in its native state it is frequently not more than 1 foot high, so that it must be considered as one of the dwarfiest Lilies grown. The flowers are small, open, and nodding; yellow or orange, varying somewhat in tint, and with numerous small dots on the perianth divisions. Like

other Lilies it requires to become well established before it develops its best characters, and for a time after planting the bulbs only weakly growth need be expected. When, however, it has taken to the soil, and the situation is favourable—moist without being wet, and moderately sheltered—it will grow rapidly. In contrast with *L. auratum* or *L. lancifolium*, such small-flowered species as *L. parvum* cannot claim a great amount of attention, but the graceful habit and bright flowers render it a favourite in gardens whenever it is well known. The wood-cut (fig. 8), was prepared from a sketch of some flowers shown by Mr. T. S. Ware in a group of Liliiums at one of the recent meetings of the Royal Horticultural Society.

ROYAL HORTICULTURAL SOCIETY.

JULY 23RD.

MAINLY no doubt in consequence of the National Carnation and Picotee Society's Show being held in the Drill Hall the building had quite an animated appearance, but as the day advanced rain fell and the light was far from being favourable for the inspection of the several exhibits. A report of the Florist's Exhibition appears below.

FRUIT COMMITTEE.—Present: Sir C. W. Strickland, Bart., in the chair, and Messrs. R. D. Blackmore, G. Bunyard, A. Pearson, J. T. Saltmarsh, W. Warren, G. Wythes, H. Balderson, W. Bates, J. Cheal, Harrison Weir, and J. Wright.

Mr. H. Marriott, Prospect House, Skirbeck, Boston, sent a dish of very fine Peas named the Pride of Lincolnshire. No particulars accompanying the exhibit, it was passed by the Committee. Mr. N. Fuller sent a fruit of Idsworth Park Melon, rather thin in the flesh, and though good was not considered equal in merit to other varieties in cultivation. Mr. W. Allan, Gunton Park, sent fruits of Gunton Park scarlet-flesh Melon, handsome in appearance, but not of sufficiently high quality to merit an award. Mr. Allan also sent handsome fruits of Allan's Favourite Cucumber, the result of a cross between Blue Gown and Telegraph: an award of merit was recommended. Mr. A. Dean sent examples of Early Snowball Cauliflower, very dwarf, and a vote of thanks was accorded. Dicksons, Limited, Chester, sent examples of wood wool, the softest not sweet and the sweetest a little harsh. The best kind the Committee have had before them was made from Poplar wood. Messrs. Paul & Sons, Cheshunt, sent a dish of White Versailles Currant, and the variety was advised to be grown at Chiswick. Mr. Bunyard sent dishes of red and white Joaneating Apple; also fruit of Red Astrachan, grown under glass, beautiful in appearance (vote of thanks).

Messrs. J. Veitch & Sons sent a remarkable collection of Goosberries, 112 varieties being arranged in dishes, and a number on stems as cut from the bushes, also several Currants and a few dishes of early Apples, the best of these being Irish Peach; a silver medal was recommended. Messrs. Paul & Son, Cheshunt, sent about fifty dishes of very fine Goosberries, also a dish of The Hornet Raspberry, several of the fruits quite ripe others quite green. They were grown by Mr. Balderson, who stated his plantation gave a succession of fruit sometimes till October. A bronze medal was recommended to Messrs. Paul for their excellent contribution. Messrs. Sutton & Sons, Reading, sent fruiting plants of fifteen varieties of Capsicums, the Bell or Bull-nose being the largest, and the Coral Red Chili previously certificated the smallest. The richly coloured and variedly-shaped fruits had quite an attractive appearance. A bronze medal was recommended for the interesting collection.

FLORAL COMMITTEE.—Present: John Fraser, Esq., in the chair, and Messrs. W. Holmes, G. Nicholson, H. Herbst, G. Paul, R. B. Lowe, B. Wynne, W. Goldring, and F. Ross. Among the plants examined first-class certificates were recommended for the following:—

Cornus siberica Spathi (Veitch).—A dwarf shrub, with leaves 3 inches long and 1½ wide, the prevailing colour orange yellow with green centre; highly effective.

Retinospora pisifera aurea (Veitch).—A graceful golden pyramid, well adapted for hall and balcony decoration, also for lawns and front positions in shrubbery borders.

Spiraea gigantea (G. Paul & Son).—A stately plant, 8 to 9 feet high, with large Vine-like leaves, and a branching head of white inflorescence; very distinct.

Pteris serrulata formosa (Coleman).—A remarkable drooping form, the crested fronds hanging down for a foot in length, like a wig, and as exhibited decidedly ornamental.

Bignonia chirei (Ross).—An old and highly effective conservatory climber, with deep crimson trumpet-shaped flowers.

Bouvardia Mrs. Robert Green (H. B. May).—A dwarf, very floriferous variety, with dense trusses of rosy salmon flowers.

Cyrtomium falcatum Fensomii (Fensom).—A sturdy growing, very deep green form of the well-known species, of considerable decorative value.

Messrs. J. Veitch & Sons had an attractive group of hardy trees, shrubs, and flowers, amongst which the *Cornus* above mentioned; *Ulmus Dampieri aurea*, with its golden foliage; *Spiraea callosa atrosanguinea*, with its deep flowers; *Astilbe Thunbergii*, with white feathery inflorescence, arrested attention; also a box of beautiful varieties of greenhouse Rhododendrons. Messrs. H. Cannell & Sons sent plants remarkable by their sturdiness, and large double flowers of double Begonias. They were raised from seed in January, the stems not more than 5 to 6 inches from the pot, and upright Hollyhock-like flowers, on such

stout stalks that stakes would have been superfluous. Adjoining them was a stand of beautiful Verbenas from Swanley, and vases of the fine yellow Carnation Germania. Messrs. J. Cheal & Sons sent a collection of single and double Dahlias, several of the former being attractive by their Carnation-like markings, and the whole meritorious. Messrs. G. Paul & Son arranged a highly attractive group of hardy herbaceous flowers. Mr. A. Waterer exhibited several very handsome varieties of *Lilium auratum* raised from seed. Mr. G. Wythes sent from Syon House trusses of *Clethra arborea* and a very large flower of *Cereus hexagonus*. Mr. W. Roupell sent very handsome and admirably grown plants of *Polystichum proliferum*, with fronds 2 to 3 feet long, covered with pale green plantlets. Both the plants and fronds individually as thus grown possess high decorative value for appropriate positions.

An award of merit was granted for a collection of Sweet Peas in clear and beautiful colours sent by Mr. H. Eckford. Mr. Laxton also exhibited Sweet Peas in excellent variety and diversified colours. A bronze Banksian medal was recommended to Mr. W. Rumsey for a large collection of cut Roses. We do not know whether other awards were made, though there appeared signs of a return to the time-honoured custom of placing cards on the exhibits before late in the day.

[A meeting of the Floral Committee was held at the Society's Gardens, Chiswick, on July 18th. Present: Mr. W. Marshall in the chair, Messrs. Pilcher, Dean, Herbst, Leach, Hobb, Hibberd, Pollett, Wynne, Nicholson, Cannell, and Goldring. The Committee inspected the collections of Ivies, Stocks, and hardy flowering annuals growing in the Gardens, giving marks of merit to the most approved varieties. A full report of these trials will be published in the Society's Journal.]

ORCHID COMMITTEE.—Present: Dr. M. T. Masters in the chair, with Messrs. James O'Brien, F. Moore, E. Hill, C. Pilcher, H. M. Pollett, J. Douglas, H. Ballantyne, and H. J. Veitch.

A first class certificate was recommended for *Sobralia xantoleuca alba* (Veitch), a charming white wax-like flower, with a primrose throat. Botanical certificates were recommended for *Maxillaria fuscata* and *Dendrobium revolutum* from the collection of Sir Trevor Lawrence, Bart., M.P., who also exhibited well flowered plants of *Cattleyas* Eldorado, Painted Lady, and Wallisi, both very chaste. Mr. H. M. Pollett exhibited *Cattleya Eldorado alba splendens*, the deep colour extending quite round the lip, sepals and petals white, having a bold contrasting effect.

NATIONAL CARNATION AND PICOTEE SOCIETY'S SHOW (SOUTHERN SECTION).

THE expectations of a good Show this year at the southern reunion of the National Carnation Society have been, it is gratifying to say, more than realised, and it is our pleasant duty to record an unqualified success. It is doubtful if a show so good has ever been held by the Society; at all events, the florists present, and they were many, coming from nearly all parts of the country, were unanimous in their opinion that the Show was an admirable one in every respect. The flowers were excellent in quality, and what is not less noteworthy, there was abundance of competition, so that visitors were not, as in some former years, treated to the spectacle of two or three exhibitors competing for four or perhaps six prizes. Besides such well-known growers as Messrs. Douglas, Turner, Henwood, and Phillips, there were others represented by good stands whose names are not so familiar, and from whom still better things may be expected in the future.

CARNATIONS.

To these were devoted classes for twenty-four, twelve, and six blooms, with special prizes for individual specimens, and one for the best Carnation in the whole Exhibition. There were six stands in competition in the principal class, a vast improvement on some former years, and more particularly on last season, when Messrs. Turner and Douglas had the field to themselves. Allowing much for the more favourable season this still remains a very gratifying sign, indicating not only increased interest in these beautiful and valuable flowers, but also a determination on the part of growers to give better support to the shows, even if their chance of success is not particularly bright. It has become quite a matter of course to find the two growers named fighting out the battle for first place in the chief class, and on this occasion history repeated itself. Mr. Turner was victorious with the following varieties. Back row:—Thalia, Mrs. Daniells (very large, full, and fine), Prince George of Wales, Mars, Jas. Taylor, Jas. Douglas, Chas. Turner, and Mrs. Barlow. Middle row: John Ball, Robert Lord (2), Rifleman, Unexpected, Jessica, Sporting Lass, and Jas. McIntosh. Front row: Robert Houlgrave (2), Prince George of Wales, Chas. Turner, George, Beauty of Chelmsford, Samuel Newman, and Rifleman. These were large, smooth, well finished flowers, fresh and in good colour, a great improvement on last year's exhibits. Mr. Douglas also had a wonderfully fresh and neat stand, somewhat smaller than the first prize lot, and with one or two rather coarse flowers, but well up to the average if not above it. The best were Thalia, Tim Bobbin (Gorton), Rob Roy, and Mrs. Whitbourn, though the latter might have been a little cleaner. Mr. M. Rowan, 36, Manor Street, Clapham, London, S.W., had a delightfully fresh and bright stand, but too small to cope successfully with Messrs. Douglas and Turner. He had charming flowers of Rob Roy, Master Fred, Sarah Payne, and Jessica, and was placed third, Mr. R. Sydenham, Roseleigh, Bristol Road, Birmingham, taking the remaining prize.

Of twelve there were eight stands in competition for six prizes, and they formed a large and excellent class. Mr. Rowan won with a capital stand, composed of a seedling (rose flake), Master Fred, George Melville,

Wm. Skirving, Jas. Douglas, Jessica, Fred, Rob Roy, Robt. Houlgrave, Sportsman, Edw. Rowan, and John Whitham, all smooth, fresh flowers. Mr. Douglas followed very closely with Jas. Douglas, Tim Bobbin, Thalia, and John Harland as his best blooms. Mr. J. Lakin, Temple Cowley, Oxford, was third with a good stand, containing a very fine example of *Lovely Mary*, and a beautiful bloom of *Alisemond*. Mr. W. L. Walker, Earley, Reading, was fourth; Mr. H. W. Headland, High Road, Leyton, fifth; and Mr. W. J. Nicholls, 274, Kingsland Road, London, N.E., sixth. These were all admirable stands, and formed a very interesting class.

Mr. C. Phillips, Reading, won with six blooms, the varieties being Robert Houlgrave (rather weak), Jas. Douglas (a large, well-filled, and beautiful bloom), Rob Roy, John Harland, *Alisemond* (finely coloured), and Rifleman. Mr. T. E. Henwood, Auricula Villa, Reading, followed with a capital *Thalia* among his flowers. Mr. Startup, Bromley, Kent, was third; Mr. T. Anstiss, Brill, Bucks, fourth; Mr. J. Nutt, Ross Road, Southampton, fifth; and Mr. J. J. Keen, 15, Castle Street, Southampton, sixth. There were three other stands, so this class was exceptionally strong.

Single specimens were numerous. In the rose flakes Mr. Douglas was first and third with *Thalia*; Mr. F. Hooper, Widcombe Hill, Bath, second and fifth with Mrs. George Cooling; and Mr. Henwood fourth with *Thalia*. In the purple flakes Mr. C. Turner was first and second with Prince George of Wales, the former a magnificent bloom; Mr. Hooper third and fourth with Mayor of Bath, Mr. Nicholls fifth with Squire Whitbourn. In the scarlet flakes Mr. Douglas was first and third with *Alisemond*, Mr. Sydenham second with Sportsman, Mr. Phillips fourth with Sportsman and fifth with Matador. In scarlet bizzars Mr. Henwood was first with Robt. Houlgrave, Mr. Douglas second with the same variety, Mr. Phillips third with Robt. Houlgrave and fourth with Robt. Lord, and Mr. Turner fifth with Jas. McIntosh. In pinks and purple bizzars Mr. Lakin was first with a seedling, Mr. Turner second with Jas. Taylor, Mr. Rowan third with W. Skirving, Mr. Phillips fourth with the same variety, and Mr. Headland fifth with Miss Gorton. In crimson bizzars Mr. Rowan was first with Master Fred and fifth with J. T. Hextall, Mr. Douglas second with John Harland, Mr. Turner third with Rifleman, and Mr. Phillips fourth with John Harland.

The premier Carnation was a beautiful bloom of the scarlet bizarre Robert Houlgrave in Mr. Turner's first-prize stand of twenty-four, which was well shown throughout the Exhibition.

PICOTEES.

The classes in this section corresponded with the Carnations, and as there was plenty of competition a beautiful display was provided. Mr. Douglas, always very strong with Picotees, scored a meritorious victory from five opponents in the chief class. His flowers were in beautiful condition, being remarkably smooth, clean, and well finished. The varieties were as follows:—Back row: *Jessie* (2), *Princess of Wales*, *Her Majesty* (very fine), *Calypso* (first class certificate recommended), Mrs. Sharp, Clara Penson, and Brunette. Middle row: Mrs. Sharp, Mrs. Bower (2), Mrs. Payne, Liddington's Favourite (2), Brunette, and *Pride of Leyton*. Front row: *Nymph* (2), Mrs. Chancellor, Mrs. Gorton (2), Muriel, *Calypso*, and John Smith. Mr. Turner had larger flowers than his rival, but they were less smooth, clean, and finished. Nevertheless they formed a beautiful stand, and easily secured second position. They comprised a superb bloom of *Favourite*, large, well furnished, and bright, also good examples of *Duchess*, Mrs. Nicholay, John Archer, and Exhibition. Mr. Rowan was third with small but clean and fresh flowers, and Mr. Hooper fourth.

There were nine stands of twelve, the best coming from Mr. Rowan. It was composed of Brunette, Mrs. Payne, Mrs. Sharp (a charming bloom), *Favourite*, Edith D'Ombain, Nellie, Amy Robsart, J. B. Bryant, Muriel, Clara Penson (very good), Morna, and Mrs. Gorton. Mr. Henwood was a capital second with large but not perfectly filled flowers; Mr. Douglas third with a well-finished stand; Mr. Lakin fourth; Mr. Headland fifth; and Mr. H. Morris, Hayes, Kent, sixth. There were eight sixes, Mr. Phillips winning with *Favourite* (very good), Mrs. Ricards, Mrs. Payne, John Smith, Zerlina, and Ann Lord. Mr. W. L. Walker was a close second, with a stand of beautifully fresh and well-finished flowers, Mrs. Sharp and Emily both being charming blooms. Mr. J. Rebbeck, 5, Bevois Terrace, Southampton, was third, Mr. Keen fourth, Mr. Anstiss fifth, and Mr. Nutt sixth.

There was a great array of single specimens, with some beautiful examples amongst them. Rose, light edge.—Mr. T. E. Henwood first (variety unnamed), Mr. Turner second with *Favourite*, Mr. Rowan third with Nellie, Mr. Douglas fourth with Liddington's *Favourite*, and Mr. Phillips fifth with Nellie. Rose, heavy edge.—Mr. Turner first with Mrs. Payne and fourth with Edith D'Ombain, Mr. Douglas second with Mrs. Payne and third with Mrs. Sharp, and Mr. Rowan fifth with Lady Louisa. Purple, heavy edge.—Mr. Henwood first (variety unnamed), Mr. Turner second with Mrs. Chancellor, Mr. Douglas third and fifth with *Calypso*, and Mr. Lakin fourth with a seedling. Purple, light edge.—Mr. Lakin first with a seedling, Mr. Turner second and fifth with Baroness Burdett Coutts, Mr. Henwood third (this exhibitor should name his flowers), Mr. Headland fourth with *Pride of Leyton*. Red, heavy edge.—Mr. Douglas first and second with Brunette, Mr. Turner third and fourth with *Princess of Wales*, and Mr. Henwood fifth. Red, light edge.—Mr. Douglas first and fifth with Mrs. Gorton, Mr. Rowan second with the same variety, Mr. Phillips third and fourth with Thos. William. Yellow grounds.—Mr. Douglas first and second with *Remembrance* (a beautiful variety, delicately edged with rose, for which a first-class

certificate was recommended), Mr. Turner third with Agnes Chambers, Mr. Henwood fourth with Agnes Chambers, and fifth with Annie Douglas.

The premier Picotee in the Show was the beautiful example of Mrs. Payne in Mr. Turner's second prize stand of twenty-four. It was in almost faultless flower, large, well filled, and finely formed.

MISCELLANEOUS, SELFS AND FANCIES.

This section closely corresponded with the former two. There were five stands of twenty-four, the best coming from Mr. Turner, a splendid lot of flowers, finely developed, clean, and very richly coloured. The varieties were:—Back row: *Germania* (2), *Comte de Chambord*, Viscountess Down, Rose Celestial, and a purple seedling. Second row: Viscountess Down, Mrs. Harding, The Governor, Dazzle, a purplish crimson seedling, and Lady Rose Molyneux. Third row: Dazzle, Constance, Purple Emperor, Rose Celestial, Mrs. Harding, and Mrs. Payne. Front row: Lady Rose Molyneux, a purple seedling, Fred, Mrs. Payne, Searlet Gem, and Purple Emperor. Mr. Douglas was second, but some points in the rear; his stand was a little uneven, but contained several exceptionally fine flowers. Mr. F. Hooper was third; Mr. G. Hooper, 7, Cambridge Place, Widcombe, Bath, fourth; and Mr. R. Dean, Ealing, who showed undressed seedlings from the open ground, fifth.

There were no less than fourteen stands of twelve, and they formed a rich display. Mr. Henwood won with a beautiful collection, the varieties being Colonial Beauty, Gladys, Joe Willett, Black Knight, Purple Emperor, Mrs. Rowan, Rose Celestial, Colonial Beauty, Ada, Rob Roy, Sir F. Roberts, and Marchioness. Mr. Rowan was a good second with a very bright and beautiful stand; one or two blooms were small, but all very neat and fresh. Mr. Sydenham was third, also showing remarkably well; Mr. W. L. Walker fourth, Mr. Lakin fifth, and Mr. A. J. Sanders sixth. There were seven stands of twelve yellow grounds, Mr. Turner winning with a grand box, comprising Colonial Beauty (2), *Almira* (2), *Dorothy* (2), Agnes Chambers (2), and four seedlings. Mr. Douglas was second with smaller, but neat, well finished blooms; Mr. F. Hooper third, and Mr. Henwood fourth. There were ten stands of sixes, Mr. G. Hooper winning with *Almira*, Agnes Chambers, Annie Douglas, Duchess of Albany, Mrs. Little, and a seedling. Mr. Phillips was second, Mr. Rebbeck third, Mr. J. D. Kew, Southend, fourth, and Mr. Lakin fifth.

With plants in pots (twelve, in pots not exceeding 8½ inches in diameter), Mr. Turner won, Mr. Douglas second, and Mr. Headland third. Among Mr. Douglas' plants was *Ruby*, a very bright and substantial self, for which a first-class certificate was recommended.

Certificates were recommended for the following Carnations and Picotees:—

Ruby (Douglas).—Rich ruby-red self Carnation. Pot plant shown, bearing several large blooms.

Remembrance (Douglas).—Yellow ground Picotee, lightly edged with rose. The best of its class in the Show.

Calypso (Douglas).—Heavy purple edge Picotee, smooth, well-formed substantial flowers.

Souvenir de Headland (Headland).—Light red edge Picotee, petals of great substance, bloom smooth and well formed; a great acquisition.

After the judging was completed luncheon took place at the Hotel Windsor, Dr. Hogg presiding, with Mr. J. Shirley Hibberd in the vice-chair.

MR. SHIRLEY HIBBERD'S LECTURE.

ON the occasion of the Exhibition Mr. Shirley Hibberd gave a brief discourse on the origin of the Florist's Carnation. He began by assuming as a starting point that *Dianthus caryophyllus* is a pure species, and the parent of all our Carnations and Picotees. It has, on the other hand, been assumed by certain botanists that the Carnation is of mixed descent and a mere mongrel of the garden. Some such belief must have prevailed in the days of Shakespeare, for Perdita's objection to Carnations as "Nature's bastards" was intended to be understood by the mixed audience of the theatre, and it suggests not only the prevalence of the belief, but perhaps also the popularity at that time of the Carnation as a garden flower. The wild forms of *Dianthus* that might by any possibility be regarded as the parents of the Carnation are three in number only: The Sweet William may be regarded as the garden form of *Dianthus barbatus*, the Pink may be an improved edition of *Dianthus plumarius*, and the Carnation differs in no essential particulars from the wild form of *Dianthus caryophyllus*, though larger, fuller, richer, and immensely various in colouring. In its general character it stands distinctly apart from *D. barbatus* and *D. plumarius* as free from any taint of other blood, and Perdita's objection has no scientific truth; it is mere sentimentalism. The wild Carnation is registered as occurring at Rochester, Deal, Norwich, Rouen, and places thence southward to the Mediterranean. Bentham ignores it as a British plant, and Watson reports that *D. plumarius* has been mistaken for it, which is not surprising, seeing how nearly alike they are under some circumstances. But *D. caryophyllus* is constant in its characters (which were described), and it never produced Pinks or Sweet Williams, however degenerate the seed might be, while as to time of flowering, it did not usually flower until the Pinks and Sweet Williams had finished their season, a sufficient reason for their so seldom appearing side by side in exhibitions. We have mule Carnations; all the several forms of the flower, whether Cloves, Show flowers, Fancies, or "tree" Carnations, were true to the leading characters of the species, the limits of variation being apparently sharply defined by Nature.

As to the age of this flower, we have a pretty clear history of it for

300 years, but it is more likely to be a thousand than 300 years old as a garden flower. Turner in 1550 spoke of it as less the child of Nature than the product of the labour and wit of man, a statement that certainly suggests that long ere Turner's time the florists had operated on the flower and made it beautiful and popular. Beckmann's assertion that floriculture in Europe dates from the middle of the sixteenth century is simply ridiculous, for Turner and Shakespeare are witnesses to the fact that in their time certain flowers that had long been under cultivation, and had thereby been modified to suit the fancies of the florists, were no rarities, but were common in English gardens. A reasonable assumption in regard to the estimate of the flower by Turner is that it had then been in cultivation as many years as have passed since he wrote the "Herbal" we now so greatly value. This assumption extends the career of the flower as a garden favourite to a period of 700 years. We may reasonably imagine its introduction to be coeval with the coronation of Richard of the Lion Heart, and this idea leads to another, that the Carnation was possibly introduced to Europe and this country by the Crusaders. It is, moreover, of importance to note that the Carnation was valued by the ancients for the flavouring of beverages, and this consideration gives a clue to the meaning of the assertion of Pliny in his xxv. book, that the cantabrica was obtained by the Romans from Spain in the days of Augustus, who entered on the consulship on January 1st, B.C. 33, which carries back the history of the flower as nearly as need be to 2000 years. When Gerard published in 1596, Carnations were plentiful in gardens, and he records obtaining a yellow variety from Poland through the kindness of a friend. Parkinson, publishing in 1629, speaks of the varieties as being so numerous that to describe them would be an endless task. Moreover, those figured by Parkinson are of great size and variously spotted and striped; in fact, so far removed from the wild form of *D. caryophyllus* as to assert for themselves long occupation of the garden as subjects of the florist's patient care. Rea, in his "Florilege," 1676, gives a list of 360 sorts, remarking that they were raised in Holland, and brought thence to London. Lately, said Mr. Hibberd, I have submitted to certain friends a list of 320 varieties of Carnations that were conspicuous in prize lists in the year 1822, and these friends declare there is not one of them in cultivation at the present time; and yet the improvement, or say alteration, of the flower is accomplished but slowly. The varieties figured by Parkinson show how in his time the stripes were passing outward to the edge to form the Picotee; and the bizarre Carnation, figured in the "Botanical Magazine" in the year 1788, is of such high quality that it might be put on the show table to-day with a fair chance of winning, proving that 100 years of work do not greatly affect the flower as regards its technical qualities, a fact strikingly illustrative of its possible high antiquity; and yet through the long period of its occupancy of the garden we have no evidence that at any time it has deviated in any degree from its typical characters as to suggest hybridisation. All the varieties we hear of and see appear to be genuine representatives of *Dianthus caryophyllus* alone. They are varieties resulting from cross-breeding, without the aid of other blood; true hybrids of the Carnation may be said to be unknown.

The lecture was illustrated by plants and diagrams of an interesting nature, one object of which was to demonstrate that the wire-edge Picotee had been formed in precisely the same manner as the edged Auricula by the gradual pushing out of the colour to the edge, and refining it there from radial spots to a close sharp line.

EVENTS OF THE WEEK.—To-day (Thursday) there are Shows at Castle Ashby, Hereford, Luton (second day), Southwell, and Trentham, also the Exhibition of the Surrey Floricultural Society in the grounds of Casino House, Herne Hill (second day). On Friday, July 26th, Alderley and Wilms'ow, on the 27th Crewe, and there will also be a general meeting of the Royal Botanic Society on the latter day.

ROYAL HORTICULTURAL SOCIETY.—At a general meeting of the Society held last Tuesday, Dr. Robert Hogg in the chair, the following candidates were duly elected Fellows:—viz., Henry Appleby, Charles Blick, James Butler, J. Charlesworth, Richard V. Coleman, W. F. Dart, Thos. Freeman, Miss Hardcastle, Hon. W. F. B. Massey-Mainwaring, Frederick Pitman, S. Pratt, Philip Scott, Martin Ridley Smith, Professor Sidney H. Vines, F.R.S., Edward Thomas Whitaker, and Rev. A. Thorold Wood.

HEAVY RAINFALL.—Just too late for insertion last week, we received a note from Mr. E. Wallis, Hamills Park Gardens, Buntingford, Herts, stating that 2.35 inches of rain fell in nine and a half hours on the night of the 12th inst., and it thoroughly cleansed trees from caterpillars and insects, with which they were infested.

— NOBLE STRAWBERRY.—A correspondent, while recognising the merits of this fine early Strawberry, doubts if the flesh is not too soft and tender for the fruit travelling well, and suggests that the experience of Strawberry growers on this point would be welcome to many readers.

— LONG BROAD BEANS.—In reference to Mr. H. W. Ward's reply to Mr. Heard on this subject, permit me to say the variety grown at Machen House is Wheeler's Giant Wonder. We have it under ordinary cultivation producing on the average twelve pods on each stalk, with from five to nine large dark green beans in each pod.—A. MCKINNON, *Machen House*.

— FLORIFEROUS LILIUM.—Mr. E. Butts writes:—"In the garden of Tudor Cottage, King's Road, Clapham Park, the residence of A. Rawlinson, Esq., there is now flowering a *Lilium auratum* bearing what I believe to be an unusual number of flowers. The bulb produced four growths carrying respectively 57, 37, 27, 17 flowers—total, 138. The three strongest growths are fasciated; the bulb is growing in a bed of peat among some Rhododendrons, this being the third year of flowering."

— LAXTON'S JUBILEE STRAWBERRY.—Will some of your readers kindly give their experience of this Strawberry? With me it is bearing well, with handsome well-sized fruits and good flavour, and it is a good deal later than President or Sir Joseph Paxton, and Elton Pine is over with me. I am just beginning to gather Jubilee (July 15th).—JAMES BUBB, *Nurseryman, Solihull*.

— DRACÆNAS IN BLOOM.—*Dracæna gracilis* in the conservatory at Brockhurst, East Grinstead, is an interesting object just now. There is one fine plant from the summit of which a flower spike has pushed and drooped to a length of 3½ feet, bearing a thick truss of pinkish lilac flowers. The effect is singular and undeniably attractive.

— ANOTHER conspicuous plant in this conservatory is a globular specimen of the fragrant *RHYNCHOSPERMUM JASMINOIDES*, 4 feet high and through, covered with its white flowers, which perfume the whole structure. The plant was previously trained to a wall, but has been taken down, and now, being potted, forms a very fine object.

— ALEXANDER PEACH.—I was rather surprised to find, on looking over our Peach trees on the open wall, that one I have under the name Alexander is ripe; the next tree to it (Hales' Early) will to appearance not be ripe for a fortnight. I send a fair specimen, the tree being rather heavily cropped.—J. GIBSON, *Draycot*. [Alexander is known as the earliest Peach, but the specimen referred to was crushed or shaken beyond recognition.]

— CEANOTHUS GLOIRE DE VERSAILLES.—As a successional flowering climber to *C. divaricatus* and *C. azureus*, Gloire de Versailles is excellent. It grows quickly, and flowers freely in a favourable position on a wall, a southern aspect being the best. With liberal treatment this is one of the finest of wall plants for flowering at this time of the year. Abundance of water is necessary in dry weather, especially if the wall on which the shoots are trained is built of soft red bricks, as these absorb the moisture from the soil in a surprising manner, much to the detriment of the plants.—E.

— PRESERVING ALLAMANDA BLOOMS.—In the ordinary manner Allamanda blooms do not last long in a cut state—not more than a couple of days as a rule—but they can be made to last quite fresh four and five days. When the blooms are just at their best cut them carefully, so as not to injure the base of the flower stem where it connects with the calyx, which occurs if the flower is pinched off. Place the stem in water; also place a little water in the centre of the bloom. It is not necessary to quite fill the cup of the flower, a couple of teaspoonfuls will be sufficient for the purpose. Neither is it necessary to change the water during the time the blooms are in use.—E. M.

— A COLOURED plate of the NEW ZONAL PELARGONIUM, H. CANNELL, JUNIOR, is published in "Vick's Illustrated Magazine" (American), and in this variety, it is remarked, the florist sees a close attainment to the points of an ideally perfect plant. The flowers are round in form, with overlapping petals, and of large size, the colour is crimson deeply suffused with purple, white eye. On a well grown plant the truss is very large, and at the same time symmetrical. The plant is of dwarf habit, blooms in great profusion, and makes a splendid specimen in the hands of a good cultivator. As a bedding plant it gives a great mass of bloom. It is an advance on other varieties of the

same colour, and will prove an acquisition to the conservatory, the window garden, and the garden bed.

— **ASTWOOD BANK AMATEUR GARDENERS' SOCIETY.**—The ninth annual excursion of the above Society took place on the 8th inst., sixteen members availing themselves of the opportunity of enjoying a day's pleasure, permission having been previously granted by the kindness of Lord Sudeley and Mr. Beach to pay a visit to Toddington Gardens, Sudeley Castle, and the jam factory in connection with Lord Sudeley's fruit farm. The kitchen gardens were first visited, and it was at once seen that an immense addition had been made to the glass, which is chiefly devoted to Tomato growing. About 200 lbs. of fruit had been despatched from one that morning. At the jam factory Mr. Alfred Beach explained the various processes. The Strawberry season being in full swing, some hundreds of hands were employed picking, and the factory is run night and day to cope with the vast crops. To describe in detail what was seen would occupy too much space.—**JAMES HIAM.**

— **NOTTINGHAMSHIRE HORTICULTURAL AND BOTANICAL SOCIETY.**—The members and friends of this Society, to the number of 250, visited Chatsworth House on Thursday last, the delightful Derbyshire home of his Grace the Duke of Devonshire. The party left Nottingham by special train, and on arriving at Rowsley entered twenty brakes and carriages which were waiting, and after a pleasant drive of about four miles arrived at the house, which was thoroughly inspected, a ramble following through the well-kept pleasure gardens, with the magnificent conservatory, the cascade, waterfalls, and fountains. The kitchen gardens were also visited, and crossing the park the house of Mr. Owen Thomas, head gardener, a worthy successor to one of the former gardeners at Chatsworth (the late Sir Joseph Paxton), was reached. The long ranges of greenhouses, vineries, Peach houses, and other glass structures necessary for keeping up a good supply of fruit, vegetables, and flowers were all inspected. The Water Lily house is a sight that cannot be excelled in any garden in England, the leaf of one of the varieties being capable of sustaining the weight of a man on its surface. The whole of the arrangements were admirably carried out by the Secretary of the Society, Mr. Edward Steward.

— **THE Rev. F. Umpleby**, chaplain of the **ANCIENT SOCIETY OF YORK FLORISTS**, conducted on Sunday a special flower service at his church at Osbalwick, York, the main object of which, apart from the primary purpose of worship, was to assist by a collection the Gardeners' Orphan Fund. In his introduction the reverend gentleman mentioned that it was inaugurated in commemoration of Her Majesty's jubilee, and had received almost unprecedented support, having the first year an income of upwards of £1800, Sir Julian Goldsmid, Bart., M.P., being its first President. Its area of usefulness was covered by about ninety district secretaries placed in every part of the country. The text for the sermon was "Consider the Lilies of the field." The simplicity, purity, and utility of Lilies were enlarged upon in an able manner. A large congregation listened to the sermon attentively. An interesting feature on the occasion was the elaborate and tasteful decoration of the interior of the edifice with flowers, sent by the members of the Society. The collection taken amounted to £2 10s., all present being highly pleased with such an interesting service, which together with the beautiful walk of about two miles into the picturesque country was most enjoyable.

— **ROSES AT THE WAKEFIELD PAXTON SOCIETY.**—The annual Exhibition of Roses was recently held at the Paxton Society's rooms at Councillor Lupton's, the Saw Hotel. Councillor Milnes was in the chair, and Mr. G. Bott of Walton, a noted and successful amateur Rose grower, occupied the vice-chair. There was a good attendance of the members. A large and magnificent display of Roses was made, the blooms being of good form and colour and the perfume delicious. Messrs. Calam of the Heath Nurseries, who are very extensive propagators and growers of Roses, and in whose nursery grounds, which are of a good warpy soil, there are at the present time some exceedingly fine specimens, staged a grand lot of blooms, which were well dressed, set up, and named, and so arranged that the various colours and tints harmonised in a manner which gave a most striking and beautiful effect. Mr. W. L. Skinner of the Silcoates Nurseries, who read a most interesting essay on Roses, showed a nice collection. Several of the professional gardeners exhibited some fine blooms, whilst the flowers shown by Mr. Bott of Walton, Mr. Calvert of Wrenthorpe, and others were very much admired. Some Rose growers complained of the mischief done to their Rose trees by the very keen and unexpected frost on

the 1st of October last, which will delay their flowering period for a couple of months, whilst on the other hand some growers said the hot and dry season had caused their trees to bloom earlier than usual. Mr. Skinner, in his essay, dwelt upon the various modes of propagating Roses by seeds, cuttings, and budding, and he also described the most suitable soil for these favourite and rich feeding plants, gave much information as to how to plant Rose trees, and he recommended as most suitable for growing in this district dwarf Hybrid Perpetuals. Some discussion followed the reading of the paper, in which various methods were recommended to Rose growers for getting rid of insect pests, mildew, &c. On the motion of Mr. George Gill, seconded by Mr. Squire Pickersgill, a hearty vote of thanks was given to Mr. Skinner for his paper and to the exhibitors of Roses.

TOMATOES IN POTS.

THE engraving represents one of the plants grown at Chiswick, which attracted the attention of gardeners at a recent meeting of the

FIG. 9.—TOMATO ADVANCER.

Royal Horticultural Society. It will be seen that good culture is displayed in its production, and readily conceived that as covered with rich red fruit such plants happily combine beauty with utility. The variety sketched is Advancer, a smooth red fruit of good quality. We have been favoured with the following notes on cultivation by Mr. W. Summers, the able foreman at Chiswick.

"The seed was sown on January 16th in a warm pit, and the seedlings kept as near the glass as possible. They were first potted three into a 48 in light soil, and when ready divided and placed in the fruiting pots, 9-inch, at the end of March; the plants were then about 6 inches high. The soil consisted of two parts loam and one decayed

manure, with wood ashes and sand. The pots were only about half filled with soil, thus leaving plenty of space for top-dressing. The plants if well managed show the first bunch of flowers just above the pot, thus producing fruit from the bottom of the plant. No more water is given than is needed, and the atmosphere is kept as dry as possible consistently with the growth of the plant.

"The flowers were fertilised every day with a camel-hair brush. This is a great help in setting the fruit, especially early in the season when it is not possible to ventilate very freely. After the first bunch of fruit is set the plants were top-dressed, using a richer soil, also a sprinkling of Thomson's manure, which suits them admirably. Future top-dressings were applied as required, using the same soil as before. No liquid manure was used. All side shoots were taken off as soon as they appeared, the single stem system being the best, especially for pot culture. It is important that as much air as possible be given, as it keeps the plants sturdy and helps to set the fruit, and care must be taken in watering, as plants in pots must not be allowed to suffer, though it is quite a mistake to suppose that the Tomato requires so much water as is generally supposed."

The plant when sketched was about 4 feet high, and was bearing fifty good fruits, but the whole of them, for obvious reasons, are not shown.

GLoucestershire ROSE SOCIETY.

WILL you allow me to correct an error of an otherwise friendly critic upon the Gloucester Rose Show in your paper of last week? He describes us as belonging to one point only of the compass of the county, and not, as we wish to be, the Gloucestershire Rose Society. It is also only true to say that the Society was inaugurated under the auspices of a few ladies, whose names are now in the list of President and Patronesses. The Society bids fair to be strong in the best influences, which every true lover of the Rose would desire. We could scarcely wish for greater success than that which has been achieved for us. If you are able to publish this note I shall be grateful for the record of our thanks to those through whom only this success was possible to us. —THOMAS HOLBROW, *Hon. Sec.*

CHRISTLETON.—JULY 11TH.

THIS Show, originally fixed for July 23rd, was held in the Rectory Field at Christleton, two miles from Chester, on the date named. The day was brilliantly fine, a large company came to see the Roses, and everything passed off most successfully. In point of quality the Show fell rather below its usual high mark owing to the retirement of Mr. T. B. Hall, whose Roses have always been a great feature here, and the absence of the large growers at other shows held on the same day. Still the general average was very good, and it would be difficult to name a more pleasant Show, whether looked at from an exhibitor's or a visitor's standpoint. It is thoroughly well managed, the schedule carefully and liberally drawn up to suit all classes of Rose-growers, and it is held amid very beautiful surroundings.

Nurserymen were not largely represented, only Messrs. Harkness of Badale and Messrs. Dickson of Chester putting in an appearance, and they stood thus in the prize list for thirty-six varieties and twelve triplets. Messrs. Harkness showed fine fresh blooms of Ulrich Brunner, Her Majesty (both fine), Marie Verdier, Reine du Midi, Fisher Holmes, Madame C. Crapet, Marie Rady, François Michelin, A. K. Williams, Merveille de Lyon, Etienne Levet (very good), C. Darwin, Baronne de Rothschild, Prince Arthur, Marie Finger, Alfred Colomb, Violette Bouyer, Alphonse Souper (good), Countess of Rosebery, H. Vernet (fine), Souvenir d'Elise, Rosieriste Jacobs (good), Catherine Mermet, Heinrich Schultheis, Ella Gordon, La France, Général Jacqueminot, Princess Beatrice, Duc de Rohan, Mrs. J. Laing, Charles Lefebvre, Madame Eugène Verdier, Antoine Ducher, Silver Queen, Lord Macaulay, Lady M. Fitzwilliam (all these excellent). Their triplets were Queen of Queens, Marie Baumann, François Michelin, Ulrich Brunner, Mons. E. Y. Teas, Merveille de Lyon, Horace Vernet, La France, Alfred Colomb, Mr. G. Dickson, Heinrich Schultheis, Baronne de Rothschild, and Dupuy Jamain.

In the amateur classes Rev. L. Garnett of Christleton Rectory was unopposed in the principal class for thirty-six varieties, showing a very fair box, in which the best blooms were Comtesse d'Oxford, Marie Baumann, Her Majesty, Marquise de Castellane, Marie Verdier, Violette Bouyer, Comtesse de Camondo, Merveille de Lyon, and Clara Cochet.

In the class for twenty-four varieties Mr. C. J. Dry of Rowton was first with Marquise de Castellane, Marie Baumann (good), Louis Van Houtte (good), Capitaine Christy, A. K. Williams, La France, Etienne

Levet, Baronne de Rothschild, Ulrich Brunner, Alfred Colomb (good), Merveille de Lyon, Marie Rady, Gabriel Luizet, Countess of Rosebery, Lady Mary Fitzwilliam, Xavier Olibo, Dupuy Jamain, Duchesse de Valombrosa, François Michelin, Marguerite de St. Amand, Lord Macaulay, Souvenir d'un Ami (good), Fisher Holmes, and Mary Bennett. Mr. J. G. Churton of Neston was second; Mr. T. Raffles Bulley, Liscard, third.

The competition in the twelves was very keen, six or seven boxes being all of a heap, and all very meritorious. The Misses Squarry, Higher Bebington, were placed first with good blooms of Ulrich Brunner, Captain Christy, Le Havre, Prince Arthur, Etienne Levet, Baronne de Rothschild, Mrs. J. Laing, Xavier Olibo, Dupuy Jamain, Duke of Wellington. Mr. T. W. Crowther of Oxtow, Birkenhead, was second; Lieut.-Col. Standish Hore of St. Asaph third; and Mr. W. E. Hall of Higher Bebington fourth. In sixes also there was a close fight, won finally by Lieut.-Col. Standish Hore with Marie Verdier, Madame L. Delaplace, Marie Baumann, Comtesse de Nadaillac, Caroline Kuster, Le Havre; the Misses Squarry second; and Mr. D. Walford third.

Mr. Desborough Walford of Spital, Birkenhead, easily won the first prize for six blooms of La France (a very good box). Rev. L. Garnett second. For six blooms of any other light or red Rose (not La France) Rev. L. Garnett was first with good examples of Alfred Colomb. Dr. Bell of New Brighton second with Mrs. J. Laing. Rev. L. Garnett also had the best box of white Roses (Merveille de Lyon) Mr. T. Tatham of Wilmslow being second with the same variety.

In the Tea or Noisette class, Rev. L. Garnett was again in front with a good box of twelve as follows—Hon. E. Gifford, Souvenir d'Elise, J. Ducher, Madame H. Jamain, Comtesse de Nadaillac, Innocente Pirola, Madame Cusin, Comtesse Panissa, Bouquet d'Or, Francisca Kruger, The Bride, and Souvenir d'un Ami. Mr. C. J. Day was second. Lieut.-Col. Standish Hore had a walk over for six, and Rev. L. Garnett for four triplets.

Hardy herbaceous flowers have always been a special feature at the Christleton Show, and this year prizes were offered to nurserymen for not less than twenty-four varieties. Messrs. Dickson won first prize with a good stand, conspicuous among their flowers being *Campanula persicifolia alba fl.-pl.*, *Gladiolus The Bride*, and *Gladiolus delicatissimus* (certainly most delicate and charming), also a new hybrid of *Lychnis coronarius*, raised by Mr. A. O. Walker, late of the Lead Works, Chester. This is called by Messrs. Dickson, who hold the stock, *Agrostemma hybrida Walkeri*, and is certainly a most showy plant, a great improvement on its parents. Messrs. Harkness had a very telling exhibit, showing fine masses of *Coreopsis lanceolata*, *Campanula carpatica alba*, *Papaver nudicaule* (all three colours), *Eryngium giganteum* and *amethystinum* (both very fine), but they lacked the variety of Messrs. Dickson's stand, and had to put up with second place.

Among the amateurs Rev. L. Garnett took first place with thirty-six varieties, chief among them being a fine flower of *Iris Kämpferi*, with excellent examples of *Gaillardia grandiflora*, *Scabiosa caucasica*, *Gladiolus ramosus* Queen Victoria, *Chrysanthemum maximum*, *Gladiolus The Bride*, *Bahia lanata*, and *Platycodon grandiflorum album*. Mr. R. L. Garnett, Wyrside, Lancaster, was a good second. In his stand were fine specimens of *Delphinium Rayon de Soleil*, *Chrysanthemum maximum*, *Gentiana septemfida*, and *Lilium chalcedonicum*.

Mr. Townsend Mee was first with twenty-four varieties, a fine showy stand, in which *Lathyrus Sibthorpi* attracted much attention from experts. Mr. D. Large of Christleton was second; Mr. D. Walford of Spital third. In the class for twelve varieties, Mr. J. Wynne of Waverton was first, Mr. J. Major of Waverton second, and Mr. Combes of Christleton third.

NEW BRIGHTON.—JULY 13TH.

THIS Show, as I have before explained, is of a peculiar, yea, I may say a unique one, for while at some shows Roses are sold as at Wirral for the benefit of some charity, this has that solely for its object. A kind-hearted and benevolent doctor, who has a pretty villa residence at this favourite and rapidly rising place on the Cheshire shore of the Mersey, has organised this exclusively for the benefit of some of the local charities, Children's Hospital, Cottage Hospital, and such like, and all the profits of them are devoted to that purpose, and it must have grieved the kind heart of Mr. Bell to have held it on such a day as Saturday, the 13th, when an incessantly wet day must have marred all his hopes and prevented his having the pleasure of handing over a substantial balance to "his children," as he calls the inmates of the Children's Hospital, but such things will and do happen in our fickle climate, while it was especially trying in this year when we have had so much delightful and enjoyable weather.

Despite, however, this unfortunate contretemps, there was a very fine Show, at which some admirable flowers were staged, and here, too, one had the opportunity of seeing Mr. Dickson of the Newtownards firm, whose name is now a household one amongst rosarians as the raiser of those grand flowers Earl of Dufferin, Miss Ethel Brownlow, and others, which will soon become known to English Rose growers. Here, too, the Messrs. Harkness of Yorkshire brought their fine flowers. Messrs. Cranston showed in the style which reminds us of former days; and although the grand Roses of Mr. T. B. Hall were wanting, Mr. Grant came out with his magnificent blooms, while the local amateurs such as Mr. Desborough Walford, the Misses Squarry, and others, showed that they have learned a good deal by the exhibits which they have from year to year seen, and seldom have I seen so few indifferent

blooms shown, and altogether the Show, though a small one, was a deeply interesting one.

There was a very sharp contest in the nurserymen's class for forty-eight blooms. The race between Messrs. Cranston & Co. and the celebrated Yorkshire firm, who were first and second respectively, was a very close one, while Messrs. Dickson & Sons of Newtownards, Co. Down, Ireland, made an excellent third, especially when one considers the distance from whence they came and the length of time their blooms must have been cut. Messrs. Cranston's stand consisted of the following flowers:—Ulrich Brunner, François Michelin, Louis Van Houtte, La France, Madame Charles Wood (a magnificent bloom, one of the very finest of this flower I have ever seen), Merveille de Lyon, Pierre Notting, Madame Charles Crapelet, Lady Mary Fitzwilliam, Baroness Rothschild, Marie Verdier, Reynolds Hole, Jean Ducher, Exposition de Brie, Queen of Queens, Charles Lefebvre, Paul Neyron, Alfred Colomb (a splendid well-coloured flower), Madame Isaac Pereire, Marie Rady (a superb bloom), Duchesse de Morny, Le Havre, Etienne Levet, Bartholémy Joubert, Her Majesty, Maréchal Vaillant, Marie Cointet, A. K. Williams, Marie Finger, Lord Macaulay, Niphetos, Sénateur Vaisse, Duc de Rohan, Silver Queen, Rosieriste Jacobs, Souvenir de Paul Neyron, Devienne Lamy, Etoile de Lyon, Souvenir de Paul Neyron, François Louvat, Star of Waltham, Beauty of Waltham, Viscountess Folkestone, Dr. Andry, Maréchal Niel, Prince Arthur, The Bride, Abel Carrière, and Souvenir de la Malmaison (a lovely bloom). In Messrs. Harkness' stand the following were very fine:—Xavier Olibo, Fisher Holmes, The Bride, Duchess of Bedford, and Auguste Rigotard. Messrs. Dickson's stand was especially interesting as containing several of their own seedlings, amongst them Earl of Dufferin (very fine), Countess of Dufferin (a very beautiful light pink flower of great size of petal and good substance), T. W. Girdlestone (another of their new Roses, a large shell-like petal, purplish red, and wonderfully fragrant). They had also fine blooms of Jean Ducher, Madame Hippolyte Jamain, Prosper Laugier, Ulrich Brunner, and Her Majesty. The class for twelve of any one Rose, Messrs. Cranston & Co. were first with Alfred Colomb; Messrs. Dickson second with La France.

In the class for twelve Teas, Messrs. Cranston & Co. were also first with Souvenir de Paul Neyron, Maréchal Niel, Catherine Mermet, Madame Bravy, Souvenir d'Elise, Comtesse de Riga du Pare, The Bride, Madame Cusin, Niphetos, Francisca Kruger, and Innocente Pirola. Messrs. Harkness & Son were second.

In the class for twenty-six blooms Mr. W. J. Grant was first with La France, Louis Van Houtte, Duchesse de Morny, A. K. Williams, Her Majesty, Alfred Colomb, Mdlle. Susanne Rodocanachi, Charles Lefebvre, Général Jacqueminot, Madame Charles Crapelet, Baroness Rothschild, Merveille de Lyon, Prince Arthur, Lady Sheffield (very bright and good), Thomas Mills (very fine), Emily Hausberg, Captain Christy, Abel Carrière, Catherine Mermet, Charles Darwin, Niphetos, Earl of Dufferin, Dupuy Jamain, and Duc de Rohan. Mr. J. G. Churton was second. In the class for eighteen Mr. Grant was again first with Mrs. Baker, Duchesse de Morny, Louis Van Houtte, Her Majesty, Devienne Lamy, Merveille de Lyon, Marie Verdier, Ulrich Brunner, Heinrich Schultheis, Charles Darwin, Alphonse Soupert, Madame Victor Verdier, Charles Lefebvre, Madame Charles Crapelet, Général Jacqueminot, Comtesse de Nadaillac, Abel Carrière, and Le Havre. The Rev. Lionel Garnet, Christleton Rectory, Chester, was second. In the class for twelve Mr. Desborough Walford was first with Marie Baumann, Captain Christy, Duc de Wellington, François Michelin, Duke of Edinburgh, Baroness Rothschild, Charles Lefebvre, Marie Rady, Etienne Levet, Sophie Fropot, and Madame Isaac Pereire. This was an excellent stand, and is another instance of what may be done with a small collection, for Mr. Walford has not more than 100 plants altogether. The Misses Squarry were second with a fine box of Her Majesty, Louis Van Houtte, Etienne Levet, Marquise de Castellane, Baroness Rothschild, Fisher Holmes, La France, Camille Bernardin, Duchess of Bedford, Gabriel Luizet, Charles Lefebvre, Ulrich Brunner (?). Col. Standish Hore of St. Asaph was third. For twelve of any one Rose Mr. W. J. Grant was first with Alfred Colomb, the Rev. Lionel Garnet second with Merveille de Lyon. In the class for twelve Teas Mr. W. J. Grant was first with Maréchal Niel, Madame de Watteville, Niphetos, Etoile de Lyon, Catherine Mermet, Rubens, Comtesse de Nadaillac, Souvenir de Paul Neyron, Adam, Madame Cusin, Caroline Kuster, and Madame Lambard. The Rev. Lionel Garnet was second.

In the class for six for Roses grown in the district W. Bell, Esq., was first with Victor Verdier, Her Majesty, Mrs. John Laing, Louis Van Houtte, Charles Lefebvre, and Merveille de Lyon. Mr. W. Bulley was second.

The gold medal of the N.R.S. was awarded to the best box of twenty-four—Mr. W. J. Grant, the silver medal to Mr. W. J. Grant for the best twelve Teas, and the bronze medal to Mr. Bell for the best six local.

The best twelve perennials were exhibited by Mrs. W. Holland, the second being those of Mr. Bulley, and an extra prize was awarded to the Rev. Lionel Garnett, while a very pretty box of Alpines was contributed (not for competition) by Mr. Bulley. The Messrs. Dicksons of Chester also sent a very beautiful stand of herbaceous plants, containing such flowers as *Centaurea macrocephala*, *Lilium pardalinum*, *L. testaceum*, *L. candidum*, *Aquilegia chrysantha*, *Campanula pelviformis*, *Lychnis chalcedonica* fl.-pl., &c. These stands were much admired, and added greatly to the interest of the Show.—D., Deal.

P.S.—I have since heard that the afternoon cleared off, and that the funds of the Cottage Hospital did not suffer so much as was anticipated.

NATIONAL ROSE SOCIETY AT SHEFFIELD.—JULY 18TH.

SHEFFIELD is, beyond most towns, a city of contrasts. It has a dark side that is unpleasantly apparent, and which at first repels the visitor; but when the town is investigated, and its surroundings explored, it is found that beneath the uninviting exterior there is a pleasant phase such as could not have been imagined when first impressions were formed. Sheffield is an honest straightforward town of thoroughly English character, showing you its black side at once, leaving you to find its pleasant features for yourself, and not beguiling you with a fair prospect and subsequent disappointment. Entering it from the railway on a none too bright morning on Rose show mission, the prospect is little short of appalling. A cloud of smoke overhangs the city, which is enveloped in gloom. One cannot fancy beautiful Roses in such a place; but they were there, as we shall presently see.

As Yorkshire manufacturing towns differ somewhat from those in agricultural districts, so, to some extent, does the Yorkshire character also. Fine fellows are the Yorkshire gardeners, kind, hearty, full of earnestness and enthusiasm. They take a real interest in what they say and do, and when the talk and the work are of flowers there is, so to say, "no holding them." Go ahead they must and will. More than ever have they proved this year that they can hold their own in the strongest Rose company. Those wonderful Bedale growers, Messrs. Harkness and Son, have shown what Yorkshire Roses are this season, and emphasised it by carrying off the chief prize at the chief show of the year. What they have achieved so far from home it might be expected they would repeat in their own county, and Sheffield found them again victorious in the chief classes, and Messrs. Mack of Catterick also showed well.

But there was much of interest in the Show apart from what was done by the home county representatives. From the south came many grand blooms. Messrs. Paul & Son of Cheshunt, the Rev. J. H. Pemberton of Havering-atte-Bower, Essex, and Mr. E. Mawley, Berkhamstead, showed admirably. From the east (Ipswich) came the Rev. A. Foster Melliar, from the west (Hereford) amateur champion W. J. Grant, from the south midlands Mr. Lindsell (Hitchin) and Mr. Prince (Oxford) with his exquisite Teas. Beyond question a thoroughly representative gathering of tried growers, and from which was anticipated, and not in vain, a Show of great merit and rich in interest to the Rose lover. Such indeed it proved, and a large attendance of visitors testified to the interest that is taken in Roses in the many-acred shire.

The Show was held in the Botanical Gardens, which are quite close to the smoky town, though entirely hidden from it, and which, with their trees, lawns, and flower beds, form a most suitable and pleasant venue. Competition in one or two classes was not so brisk as usual, but then the season has been early, and the flowers of many noted growers are practically over. Mr. Frank Cant was a noteworthy absentee. Of the flowers some of the best individual examples were Horace Vernet, La Duchesse de Morny, Victor Hugo, Countess of Rosebery, Alfred Colomb, Madame Susanne Rodocanachi, Earl of Dufferin, Comte de Raimbaud, Etoile de Lyon, The Bride, Souvenir de S. A. Prince, and Francisca Kruger. But we must recall the advice of a famous knight of the circus to "cut the eackle and come to the 'osses." Here then are the awards, in collecting which Mr. E. D. Smith, an intelligent Sheffield gardener and occasional contributor to the Journal, lent valuable assistance.

NURSERYMEN'S CLASSES.

Class 1, seventy-two distinct, single trusses.—The prizes offered were £6, £4, £2, and £1 10s. respectively, and ought to have produced more competition; but it is difficult at this late date to form a strong stand of six dozen blooms. Two only competed, and both stands were fully equal to the best that might be expected considering the lateness of the season. The first prize was won by Messrs. Harkness & Sons, Bedale, Yorks, who, it will be remembered, won in the corresponding class at the Palace Show. As might be expected, they were some points below their earlier form, and Messrs. Paul & Son of the Old Nurseries, Cheshunt, ran them very closely. The blooms of the latter exhibitor were on the whole smaller than those of their rival; but, on the other hand, their stand was not weakened, as were the first prize lot, by some faded blooms. Messrs. Harkness staged the following varieties. Back row:—A. K. Williams, Merveille de Lyon, Marie Baumann, La Duchesse de Morny, Prince Arthur (all of these were splendid blooms, the last-named particularly fine), Souvenir d'Elise Vardon, Alfred Dumesnil, Constantin Fretiakoff, Duke of Wellington, Reine du Midi, Harrison Weir, Heinrich Schultheis, Mons. E. Y. Teas, Comtesse d'Oxford, Duke of Edinburgh, Duc de Montpensier, Marie Rady, Madame Eugène Verdier, Madame C. Wood, Madame Cherot, Xavier Olibo, Marie Verdier, Alphonse Soupert, and Pride of Waltham. Middle row: Captain Christy, Duchess of Bedford (splendid), Silver Queen, Ulrich Brunner, Comtesse de Nadaillac, Countess of Rosebery, Souvenir de Paul Neyron, Duke of Teek (fine full bloom), François Michelin, Maréchal Vaillant, Catherine Mermet, Beauty of Waltham, Niphetos, Reynolds Hole (compact bloom), Caroline Kuster, Madame S. de Rodocanachi, Mrs. George Dixon, Gloire de Bourg-la-Reine (superb), Perle des Jardins, Duchesse de Caylus, La France, Horace Vernet (fresh), Lady Mary Fitzwilliam, and Alfred Colomb. Front row: Fisher Holmes, Marie Cointet, Earl of Pemhroke, Duchesse de Valombresa, Charles Darwin, Grace Darling (good), Mrs. Jowitt, Marguerite de St. Amand, Dupuy Jamain (clear bloom), Innocente Pirola, John Stuart Mill (splendid bloom), The Bride, Madame Hausmann, Emilie Hausburg, Souvenir de Thérèse Levet, Comtesse de Serenye, Rosieriste Jacobs (clear and fresh),

Madame Willermoz, Antoine Ducher, Princess of Wales, Dr. Andry (good), Jean Ducher, Etienne Levet, and Louis Van Houtte (splendid). Messrs. Paul's best flowers were Marshall P. Wilder (a very beautiful bloom), Ollivier Delhomme (well coloured but a trifle rough), Comte de Raimbaud, Mrs. J. Laing (small but beautifully fresh and bright), Lady Helen Stewart (warm, rich crimson), Auguste Rigotard, and Madame Hoste (a fine pale yellow Tea). The back row flowers were a long way in the rear of those in the first prize stand.

Class 2, thirty-six distinct, three trusses of each.—It was stipulated that these triplets should be arranged triangularly, but the general effect was somewhat too stiff. A fair collection from Messrs. Paul & Son won, but where collective effect is aimed at it would be useless to particularise all the varieties. The best were undoubtedly A. K. Williams, Marshall P. Wilder (very fine indeed), Niphotos, and Alfred Colomb. There was no other stand.

Class 3, thirty-six distinct, single trusses.—Messrs. J. Jefferies and Son, Cirencester, here won after a great struggle with Mr. H. Merryweather, Southwell. The first-prize flowers were a little past, hence weakened, but they comprised some very fine examples. The varieties were:—Back row: Mlle. Susanne Rodocanachi, Paul Neyron, Mrs. Charles Wood, Her Majesty (large and full), A. K. Williams, Marie Finger, Fisher Holmes, Etienne Levet, Comte de Raimbaud (splendid), Alphonse Soupert (good), Marie Baumann, and Ulrich Brunner. Middle row: Merveille de Lyon, Louis Van Houtte (splendid), La Duchesse de Morny (good), Brightness of Cheshunt (clear and fresh), Baroness Rothschild, Horace Vernet (splendid), Madame Marie Verdier, Dingée Conard, Niphotos, Grandeur of Cheshunt, Madame Isaac Pereire, and Mons. E. Y. Teas. Front row: Dr. Andry, Mrs. John Laing, Victor Hugo (superb), Countess of Rosebery, Madame Victor Verdier (splendid), Maréchal Niel, Prince Arthur (clear and fresh), Captain Christy, Duke of Teck (good), Innocente Pirola, Le Havre, and Alfred Colomb (large and full). Mr. Merryweather had a fresh and admirable stand, indeed they were conspicuously brighter and clearer than those in the winning collection, and such varieties as Madame Eugène Verdier, Merveille de Lyon, Viscountess Folkestone, Victor Verdier, and Prince Arthur were extremely fine. Mr. G. Prince, Oxford, was third, and Messrs. G. & W. H. Burch, Peterborough, fourth.

Class 4, eighteen distinct, three trusses of each.—The first prize stand in this class came from Messrs. J. Jefferies & Son, Cirencester, who had a very fine lot, the best examples being Madame C. Wood, Alfred Colomb, Marshall P. Wilder, Her Majesty, and Earl of Dufferin. Mr. Merryweather was again second with a bright and well finished stand, and Messrs. Cooling third.

Jubilee Class, thirty-six distinct, single trusses.—Four stands competed in this class, in which the principal prize was a challenge cup, value fifty guineas, to be held one year, and the sum of £3. It was secured with a beautiful stand by Messrs. Harkness & Son, both Teas and H.P.'s being in splendid condition. There was but one weak bloom in the stand, and that was Dr. Andry. Point for point these were stronger than the blooms with which the same firm scored in the largest class. The varieties were as follows. Back row: Ulrich Brunner (large), Duchess of Bedford, May Quennell (well developed), Prince Arthur, Madame Eugène Verdier, Dupuy Jamain (good), La Duchesse de Morny, Madame Hausmann, Countess of Rosebery, Auguste Rigotard, Alfred Dumesnil, and Charles Darwin. Middle row: Marie Baumann, Princess of Wales, Horace Vernet (superb), The Bride, Sir Rowland Hill (fresh), Marie Verdier, Lord Frederick Cavendish, Souvenir d'Elise, Dr. Sewell (good), Niphotos, A. K. Williams, and Princess Beatrice. Front row:—Baronne de Rothschild, Dr. Andry, Madame Susanne Rodocanachi, Alfred Colomb (splendid), Souvenir d'un Ami, Duke of Wellington, Innocente Pirola, Pierre Notting (exquisite), Merveille de Lyon (good), Beauty of Waltham, Silver Queen, and Duke of Edinburgh. The second prize fell to Messrs. Mack & Son, Catterick, who also had a splendid box in the highest degree creditable to them. La Duchesse de Morny was superb, a large, bright, substantial, and beautifully formed bloom. Marie Baumann was in admirable condition too, although not large, and to Merveille de Lyon the same remarks apply. Madame Hausmann, Beauty of Waltham, and Madame Susanne Rodocanachi were also worthy of note. They had, however, two blooms of Exposition de Brie, overlooked apparently both by themselves and the Judges. Messrs. Alex. Dickson & Sons, Newtownards, Co. Down, who very pluckily came a long distance to compete, were third. Their blooms were very large, but with hardly an exception were past. The best were A. K. Williams, Earl of Dufferin, Horace Vernet, and Ulrich Brunner. Mr. G. Prince was fourth.

AMATEURS' CLASSES.

As in the trade section, there was a jubilee class for amateurs; twenty-four blooms, distinct, single trusses, were asked for, and the principal prize was a challenge cup, value fifty guineas, and £3 in cash. The winner was the Rev. J. H. Pemberton, Havering-atte-Bower, Essex, who has come out very strongly thus late in the season. He had a very beautiful stand, comprising some of the best blooms in the Show, and the whole in very bright and fresh condition. They were:—Back row: Victor Hugo (selected as the best amateur's H.P., very richly coloured, symmetrical, and handsome), Earl of Dufferin, Duke of Edinburgh, Louis Van Houtte (good), Annie Wood, Madame Prosper Laugier, Pride of Waltham, Comte de Raimbaud (good). Middle row: Marie Baumann, Magna Charta, Horace Vernet (splendid), Countess of Rosebery, Alfred K. Williams, François Michelin (full), Charles Lefebvre (good), and Alphonse Soupert. Front row: Auguste Rigotard (good),

Duke of Teck (very rich), Captain Christy, Harrison Weir (splendid), Beauty of Waltham, Duchess of Bedford, Alfred Colomb (good), and Prince Arthur (good). Mr. E. B. Lindsell, Hitchin, followed with a beautiful stand, the best examples being A. K. Williams, Victor Hugo, Comtesse de Nadaillac, Etoile de Lyon (best amateur's Tea, a perfect bloom of this lovely Rose), and Horace Vernet. Mr. W. J. Grant, invincible at the Palace Show, was here only third, but he had a neat and telling stand. The fourth prize went to Mr. W. Boyes, Milford.

Class 5, thirty-six distinct, single trusses.—The Rev. J. H. Pemberton was the only exhibitor here. He had a neat and very bright lot of flowers, showing the following varieties, several in admirable condition:—Back row: Alfred K. Williams, Beauty of Waltham, Sénateur Vaisse (good), Duke of Edinburgh (clear and bold), Auguste Rigotard, Exposition de Brie, Charles Lefebvre (very rich), and Countess of Rosebery (fine). Middle row: Comte de Raimbaud (splendid), Pride of Waltham, Madame Victor Verdier (beautiful), Marie Baumann, La France, Xavier Olibo, Comtesse d'Oxford, and Duchess of Bedford. Front row:—Mons. E. Y. Teas, Countess of Camondo, Souvenir de Madame Alfred, Reynolds Hole (rich), Earl of Pembroke, Madame Charles Crapelet, Madame Prosper Laugier, and Abel Carrière.

In Class 6, twelve triplets, there was no competition, but six competed in the following one, which was that for twenty-four single trusses, distinct. The first prize, a silver cup and £2, fell to Mr. Grant, who improved very materially on his previous displays, and had a remarkably strong stand, approaching his best form. He had the following:—Back row: Captain Christy, Alfred Colomb (splendid), Her Majesty, Constantin Fretiakoff, La France, Marie Baumann, Madame Susanne Rodocanachi (good), and Sénateur Vaisse. Middle row: Ulrich Brunner, Marquise de Castellane, A. K. Williams (good), Madame J. Desbois (rather loose), Duke of Edinburgh (rich), La Duchesse de Morny (good), Horace Vernet (fine), and Dr. Andry. Front row: Général Jacqueminot (fine), Prince Arthur, Madame Crapelet (full), Madame Prosper Laugier, Madame de Watteville, Duchess of Bedford, Dupuy Jamain, and Charles Darwin. Messrs. Lindsell and Rev. A. Foster Melliar, Ipswich, had a very close struggle for second place, which eventually fell to the former, but not, presumably, by many points, as there appeared to be very little between them. Mr. Foster Melliar had a splendid Alfred Colomb, Marie Baumann and Marie Van Houtte also being beautiful. Mr. Boyes was fourth. Mr. Edward Mawley, Rose Bank, Berkhamstead, won with twelve, a neat stand, comprising Etienne Levet, Captain Christy, Prince Arthur, Marie Finger, Madame Lambard, Ulrich Brunner, Comtesse d'Oxford, Duke of Wellington, Duke of Connaught, Caroline Kuster, A. K. Williams, and Reynolds Ho'e. Mr. H. V. Machin, Worksop, was second; Miss Mellish, Worksop, third; and Mr. M. Whittle fourth. These were of much the same character and merit, being small, but in good condition.

There was but one competitor in classes 9 and 10, the first prize in the former (six blooms) being won by Mr. C. Knifton, Driffield, with François Michelin, Dr. Andry, A. K. Williams, Captain Christy, Madame G. Luizet, and Louis Van Houtte, and in the latter (six blooms) by Mr. W. H. Haigh, Dore Moor, Sheffield. This and the three following classes were restricted to Roses grown within six miles of the Sheffield Town Hall. Mr. Harry Urton, Green Hill, was first with twelve, and he had a capital stand, comprising La France, Marie Baumann, Merveille de Lyon, Star of Waltham, Oxonian, and Comtesse de Serenye as his best flowers. Mr. Haigh was second. Mr. S. Doncaster, Abbeydale, had a very neat lot in the Sheffield amateurs' class for twelve, and won well, a highly creditable victory; Mr. Morton, Handsworth, being second, and Mr. T. W. Sorby, Ranmoor, third. In the amateurs' class for six Mr. Doncaster was also successful, and he well deserved his honours. He had Her Majesty very large, and Marie Baumann in excellent condition, with good blooms of Xavier Olibo, Merveille de Lyon, Madame Lambard, and Madame de Rothschild, and received a special silver medal for this fine stand. Mr. A. Penistone, Heeley, was second, and Mr. Sorby third.

TEAS AND NOISETTES.

Mr. G. Prince showed these splendidly. In the class for twelve trebles he won with Catherine Mermet, Souvenir de S. A. Prince, Madame Cusin, Francisca Kruger, Hon. Edith Gifford, Madame Lambard, The Bride, Souvenir d'un Ami, Rubens, Marie Sisley, Comtesse de Nadaillac, and Adam. Messrs. Paul & Son were second with a neat stand, more resembling buttonhole flowers. Mr. Prince again won with eighteen. He had:—Back row: Francisca Kruger (very fine), Alba Rosea, Madame Cusin, Souvenir de S. A. Prince, Catherine Mermet (good), and Princess of Wales. Middle row: Hon. Edith Gifford, Madame Lambard (fine), America, Anna Ollivier, Marie Van Houtte, and Souvenir d'un Ami. Front row: Adam, Rubens, Innocente Pirola, Souvenir de Thérèse Levot, The Bride (good), and Jean Ducher (good). They were not large but delightfully fresh. Messrs. Paul again followed. They had small flowers, but none the less a charming stand. Messrs. Jefferies won with twelve blooms, neat examples of Madame Lambard, Rêve d'Or, The Bride, Catherine Mermet, Jean Ducher, Niphotos, Madame de Watteville, Comtesse de Nadaillac, Innocente Pirola, Madame Cusin, Marie Van Houtte, and the Hon. Edith Gifford. Messrs. Burrell and Co., Cambridge, were second, their flowers somewhat faded, and Messrs. Harkness third.

A charming stand from the Rev. F. R. Burnside, Hereford, won the cup and money prize in the amateurs' class for twelve; indeed it was one of the best stands in the Show. The varieties were:—Back row: Madame Cusin (very beautiful), Madame Bravy, Hon. Edith Gifford, Comtesse de Nadaillac (good). Middle row: Jean Ducher (fine), Innocente Pirola,

Souvenir d'un Ami, and Mareelin Rhoda. Front row : Catherine Mermet Jules Finger (splendid), The Bride, and Madame Hippolyte Jamain. Mr. Lindsell was second, and he had Marie Van Houtte, Rubens, and The Bride in admirable trim, but some of the others were faded. Mr. Grant was third with small flowers, and the Rev. J. H. Pemberton fourth. Mr. Mawley won with six, delightful examples of The Bride, Catherine Mermet, Comtesse de Nadaillac, Madame Lambard, and Marie Guillot, with a weak Maréchal Niel. The Rev. A. Foster Melliar followed somewhat closely, Messrs. T. M. Whittle and Boyes being third and fourth.

OPEN.

The first class here was for twelve new Roses, and Messrs. Paul and Son won with Madame T. Ami, Her Majesty, Madame Henry Pereire (splendid), Madame Baulot (fine), Margaret Haywood, Grand Mogul, The Bride, Queen of Autumn, Earl of Dufferin, Mrs. John Laing, Sir Rowland Hill, and Duchess of Albany, H.P.

For twelve of any yellow Rose Mr. Prince was placed first with a beautiful stand of Francisca Kruger, and Messrs. Mack second with Maréchal Niel. Miss Mellish won with whites, showing a neat, fresh, pleasing stand of Niphetos; Mr. Prince being second with Souvenir de S. A. Prince, which also received the Society's gold medal for a new seedling Rose or distinct sport; and Messrs. Harkness third with Merveille de Lyon. With crimsons Mr. Prince won with a fine lot of Alfred Colomb, Messrs. Paul being second with the same variety. We failed to discover the third prize card. Mr. Prince was also first with a dark crimson, showing a beautiful stand of Prince Camille de Rohan; Messrs. Burch being second with Horace Vernet, and Messrs. Paul third with Reynolds Hole.

In Class 25, twelve single trusses, six of any H.P., and six of any Tea or Noisette, Mr. Prince won with The Bride and Alfred Colomb, the two forming a charming box, both being in excellent condition. Messrs. Cooling were second with the same varieties; and Mr. A. Evans, Oxford, third, with the Hon. Edith Gifford and La France.

Messrs. J. & R. Pearson, Chilwell, exhibited boxes of their fine Zonal Pelargoniums.

MANCHESTER—JULY 20TH.

FOR one brief bright day Cottonopolis has been transformed into Roseopolis, the devotees of the Rose—and their name is legion—assembling at the Botanical Gardens, there to participate, either as exhibitors or spectators, in the great Rose Exhibition which plays so important a part in the north of England among fixtures devoted to the queen of flowers, and which is under the experienced direction of Mr. Bruce Findlay. The schedule was in many respects an admirable one; it comprised twenty classes only, divided into three sections—nurserymen, amateurs, and residents within twenty miles of Manchester. In the first the principal class was one for seventy-two distinct, single trusses, with prizes of £7, £5, £3, and £1 10s. respectively; the remainder being thirty-six trebles, eighteen Tea or Noisette trebles, twelve Tea singles, twelve blooms of any white Rose, twelve of any crimson, twelve of any yellow, and three bouquets of Roses. A great grower's schedule it may be said, and it would perhaps have been well to introduce a smaller class, say of forty-eight or thirty-six singles, as the task of raising a seventy-two stand is beyond the power of many excellent trade growers. The advisability of this course was exemplified when the Judges commenced their rounds. There were found to be eight stands of seventy-two blooms, four of which were very weak, yet there were materials for a capital forty-eight stand in every one of them. It is a tremendous task for southern growers to make up a good stand of seventy-two late in the season, and, as will be seen, three out of the four prizewinners were northern and midland growers.

The amateurs' section corresponded with that of the nurserymen, except that thirty-six blooms were asked for in the chief class, and only twelve trebles. In the former, however, the prize money was the same as in the chief nurserymen's class, and consequently liberal enough to tempt many competitors. The district classes, four in number, were twenty-four, twelve, and six single trusses respectively, and one bouquet. It was stipulated that all the bouquets should become the property of the Council, to be sent to the sick wards at the Royal Infirmary. This was a kind and thoughtful act, enabling the sick and needy, who could not see the Show, to taste at least some of the pleasure derivable from inspecting these beautiful and fragrant flowers. The bouquets sent by Messrs. Perkins of Coventry were of rare beauty, fit for a queen to carry, and a lesson in flower arrangement worthy of the closest study.

The prize blooms were of unexpectedly high quality. Perhaps it will be said that with such exhibitors as Messrs. Harkness, Paul, Cocker, Merryweather, Prince, Cranston, Pemberton, and Grant in competition, with whose names high quality is inseparably associated, nothing less could have been anticipated, but there were at least three stands of the highest excellence and some blooms of extraordinary beauty. The stands referred to were the seventy-twos from Messrs. Harkness of Bedale and Cocker of Aberdeen, and the thirty-six triplets from the well known Irish exhibitors, Messrs. Dickson & Son, Newtownards. Messrs. Harkness, who have had an extraordinary series of successes this season, again came out with flying colours, but Messrs. Cocker also showed grandly, and were unfortunate in meeting such powerful opponents in the chief class. In many competitions they would have won with plenty to spare. Equally meritorious were the Irish triplets, indeed it is probable that a stronger lot of flowers were never got together. Amongst the finest individual blooms in the Show were Her Majesty, a finely developed beautifully formed globular flower, smooth and exquisitely coloured, in Messrs. Cocker's stand, a grand Rose shown at its very best; Alfred Dumesnil, a large and magnificently formed

flower; Madame Alphonse Lavallée; The Bride, a lovely example; La Duchesse de Morny, with its exquisite shade of delicate transparent rose finely brought out; Dr. Andry, probably the best example of the year, a glorious flower, all shown by Messrs. Harkness; Etienne Levet, a noble flower; Mrs. J. Laing, a lovely example of this splendid novelty; and Ulrich Brunner, fully equal to Messrs. Mack's silver medal flower at the Crystal Palace. The three last were shown by Messrs. Cocker, and with their grand Her Majesty referred to above formed a quartette of the finest Roses the most exacting critic could wish to see.

Below are particulars of the awards.

NURSERYMEN'S CLASSES.

Class 1, seventy-two distinct, single trusses.—No less than eight competed in this class, the most that have been in competition this season, unless we greatly mistake. Moreover, several of the stands were of a quality to astonish most visitors. Messrs. Harkness of Bedale followed up their Sheffield victory by taking first place with a magnificent stand, almost equal to that which they staged at the Crystal Palace. The strongest blooms were Alfred Dumesnil (a magnificently developed flower), Mrs. Charles Wood, Niphetos (a lovely bloom), Madame Alphonse Lavallée, The Bride (one of the finest shown this year), La Duchesse de Morny (a beautiful bloom; this has been shown very finely of late), A. K. Williams, Madame Willermoz, Alphonse Soupert, Marie Baumann, Charles Darwin, a magnificent Dr. Andry, finely developed, very rich in colour, and perfectly fresh; Catherine Mermet, Général Jacqueminot, John Stuart Mill, and Duke of Wellington. Somewhat weaker were Abel Carrière, Etienne Levet (large but flown), Fisher Holmes (out of colour), and Madame Cusin. Collectively considered the flowers were in splendid condition, and reflected the highest credit on the growers. They were far stronger than at Sheffield. Messrs. J. Cocker & Co., Aberdeen, made a bold bid for first place, and although they were defeated by some points they had a very fine stand; in fact, one that would have won at many shows. The weak part lay in the fact that some of the largest flowers had flown. Such were Alfred Dumesnil, Madame I. Pereire, Duke of Teck, and Madame S. de Rodocanachi. On the other hand, Etienne Levet was superb, the best we have seen this season. Mrs. J. Laing was in beautiful condition, large, beautifully formed, fresh, and with its lovely soft colour admirably shown. Ulrich Brunner was also magnificent. Heinrich Schultheis, Horace Vernet, Barthélemy Joubert, Général Jacqueminot, The Bride, Marie Rady, and Marie Baumann were also noteworthy examples. And last was a glorious example of Her Majesty, such a flower as it is not often given to rosarians to see. The blooms were collectively a little older than those of Messrs. Harkness, but both were grand lots. Messrs. Paul & Son, The Old Nurseries, Cheshunt, were third, but a long way in the rear, the best flowers being Victor Hugo, A. K. Williams, and Alfred Colomb. Mr. Merryweather, of Southwell, with a stand of neat, fresh, and well-finished but small blooms, was fourth, the best examples being Mdlle. Verdier, Comte de Raimbaud, Dupuy Jamain, and Merveille de Lyon. There was nothing especially noteworthy in the remaining stands, but they helped to form a class of extraordinary extent, beauty, and interest.

Class 2, thirty-six distinct, three trusses of each.—A magnificent stand from Messrs. A. Dickson & Sons, Newtownards, Co. Down, one of the best without doubt that has ever been staged, here won with the greatest ease. The flowers were in perfect condition, and even when considered individually bore the closest inspection without losing ground. Madame Prosper Laugier, Merveille de Lyon, Lady Helen Stewart, Marie Baumann, Paul Jamain, Horace Vernet, La Rosière, Countess of Rosebery, A. K. Williams, Madame Alphonse Lavallée (magnificent), and Xavier Olibo, were the best, and the Irish growers have every reason to be proud of their splendid exhibit. Messrs. Harkness & Sons having concentrated their strength on the seventy-two class, were weak here, but were placed second, on which they may consider themselves fortunate, inasmuch as Mr. Prince of Oxford had a far better finished, brighter, cleaner, and smoother stand, and we quite fail to understand his being relegated to third position. Messrs. Cocker & Sons were a good fourth. Another stand was in competition.

Class 3, eighteen Teas or Noisettes, three trusses of each.—Mr. Prince showed in his well-known form here. His is a master hand with the lovely Teas, and he won with a beautiful stand. Marie Van Houtte was lovely; Madame Cusin, though small, was charmingly fresh and well coloured, and The Bride was also very good, while not far behind were Alba Rosea, Comtesse de Nadaillac, Niphetos, and Souvenir de S. A. Prince. Messrs. Cocker & Sons were a good second, Mr. J. Mattock, Oxford, third, and Messrs. D. & W. Croll, Dundee, fourth, all fresh and good stands; indeed this was a capital class.

Class 4, twelve Teas or Noisettes, single trusses.—A charming box of Souvenir d'un Ami, Souvenir de S. A. Prince, Madame de Watteville, Maréchal Niel, The Bride, Catherine Mermet, Francisca Kruger, Rubens, Etoile de Lyon, Hon. Edith Gifford, Madame Lambard, and Innocente Pirola won first prize for Mr. Prince. Mr. Mattock, with Perle des Jardins, Souvenir de Thérèse Levet, and Devonensis as his best flowers, came next, with Messrs. Croll third, and Paul & Son, Cheshunt, fourth.

For twelve of any yellow Rose Mr. Prince was placed first with Francisca Kruger, fresh, neat flowers; Messrs. Croll second with a pleasing stand of Marie Van Houtte; and Messrs. Cocker & Sons third with the same variety, also good. A grand lot of Merveille de Lyon from Messrs. Croll won in the class for twelve whites; they were large, well formed, and fresh flowers. Messrs. Cocker were second, and Messrs.

Dickson, Newtownards, third, both with the same variety. Mr. Prince won with crimsons, a beautiful lot of Alfred Colomb; Messrs. Cranston and Co., Hereford, second with a capital lot of the same variety; and Mr. H. Merryweather third with a finely coloured lot of A. K. Williams. With bouquets Messrs. Perkins & Sons, Coventry, showing some of their best work, won by many points; Mr. Mattock, second; and Messrs. Dicksons, Limited, Chester, third.

AMATEURS' CLASSES.

These were not so well filled as those in the first section, and some classes fell through altogether, but in the principal ones the competition was both plentiful and good. The Rev. J. H. Pemberton, Havering-atte-Bower, Essex, secured, as will be seen, the lion's share of the awards. He has recently been exhibiting in better form than at the beginning of the season, and was very strong both at Sheffield and Manchester.

Class 9, thirty-six distinct, single trusses.—The Rev. J. H. Pemberton had the best stand, showing a capital lot of fresh and well finished flowers, the best being Marie Baumann, Madame Crapelet (superb), Marshall P. Wilder (very fine), Beauty of Waltham, Auguste Rigotard, Victor Hugo, and Charles Lefebvre, the weakest Merveille de Lyon (large but past), Marie Verdier, and Madame Eugène Verdier. Mr. W. J. Grant, Ledbury, though defeated, was represented by a very bright and well coloured stand, containing a beautiful Marshall P. Wilder, Marie Baumann, and Madame Alphonse Lavallée, and was placed second. Mr. S. P. Budd, Bath, third with small but fresh and good flowers. Mr. Boyes, Milford, fourth. For twelve distinct, three trusses of each, the Rev. J. H. Pemberton was again placed first, and well deserved his victory, but Mr. Grant was close on his heels. The remaining prizewinners were as in the other class. With twelve Teas and Noisettes, single trusses, Mr. Pemberton scored his third successive victory, a capital record at a large show. His Teas were of average quality, neat and fresh, the varieties being Jean Ducher, Niphotos, Comtesse de Nadaillac, Anna Ollivier, Madame de Watteville, Francisca Kruger, Catherine Mermet, Souvenir d'un Ami, Belle Lyonnaise, Souvenir d'Elise, Adam, and the Hon. Edith Gifford. Again Mr. Grant was second with Madame Lambard and Amazon, his best; Mr. Budd third, and Mr. Rogers fourth. Hence it will be seen that the placings in all these classes were precisely the same. Mr. Grant of Ledbury was the only exhibitor of twelve crimsons, and was placed first for a neat lot of Alfred Colomb, but no one showed either whites, yellows, or twelve triplets, at least we failed to find any. Mr. A. Heine, Fallowfield, won with a trio of admirable arrangement. Mr. G. Wilkes, Ashton-on-Mersey, second, Mr. Budd third, and Mr. Pemberton fourth.

DISTRICT CLASSES.

Mr. R. G. Burgess, Knutsford, showed very creditably in the class for twenty-four single trusses, and he had excellent blooms of Her Majesty, Madame Victor Verdier, Mrs. John Laing, Lady Mary Fitzwilliam, and Sultan of Zanzibar. Mr. G. Burgess, Tabley, brother of the first named, was second with a small but fresh lot; and Mr. Frank Curtis, Heaton Mersey, third. Mr. G. Burgess won with twelves, his most noteworthy flower being a very richly coloured Madame Prosper Laugier; the others small but fresh. Mr. R. Burgess was second; Mr. A. Hardwick, Ashton-on-Mersey, third; and Mr. S. Barlow, Castleton, fourth. Mr. G. Burgess again won with sixes; second, Mr. R. Burgess; third, Mr. Hardwick; fourth, Mr. Jas. Brown, Heaton Mersey. Mr. Wilkes was first with bouquets, Mr. G. Burgess second, Mr. Heine third, and Mr. Brown fourth.

The following were the most noteworthy miscellaneous exhibits:—Messrs. Dickson, Brown, & Tait, Manchester, had a collection of cut flowers, including Roses and Tomatoes. Mr. S. Barlow was awarded an extra prize for a fine lot of herbaceous flowers, including Campanulas, Delphiniums, Spiræas, Sweet Williams, Phloxes, and Lilliums, also a stand of laced Pinks. Messrs. Harkness were awarded an extra prize for herbaceous flowers, including Iceland Poppies, Gaillardias, Dianthus Napoleon III., Campanula carpatia, Alstroemeria aurantiaca, Coreopsis lanceolata, Antirrhinums, and double Delphiniums. Mr. F. Law, Rochdale, had a large group of cut flowers, including Gladioli, Lilliums, Everlasting Peas, Carnations, and a fine stand of double Dahlias. They were awarded an extra prize. Messrs. Dickson & Robinson, Manchester, were highly commended for a collection of cut flowers; and Messrs. Cocker & Sons were awarded a special prize for a beautiful collection of laced Pinks.

WIRRAL.

"THE stars in their courses fought against" this now well known and popular Rose Show, for although a lowering morning was succeeded by a brilliant day, the broken and unsettled weather of the previous few days had very materially interfered with exhibitors; and when I mention that the Cants, Prince, Cranston, Jefferies, and others were not represented, it will be at once seen that the havoc wrought must have been very great. It is possible, indeed, that the show at Wolverhampton, where large prizes were offered, had attracted some exhibitors, but many confessedly were hindered from coming by the unpropitious character of the weather, while the absence of one local exhibitor, Mr. T. B. Hall of Larkwood, Rockferry, made a gap in the amateurs' division which all who know the character and extent of his exhibits in former years can thoroughly appreciate. The Rev. Lionel Garnet, too, who has always exhibited well here, was unable to place any stands upon the stage owing to his blooms having been spoiled

by the rain. The withdrawal of Mr. Hall has, however, had an encouraging effect on other exhibitors; they were wont to think, and indeed were not far out, that it was leading a forlorn hope to attempt to scale the formidable barrier which he presented to them. They have now, however, taken "heart of grace," and I have no doubt we shall see in another year a further improvement amongst the local exhibitors who, at this Show, surpassed all their previous efforts. It generally happens that the local exhibits are of a very indifferent character, but that is not the case at Wirral, where Roses were shown by those living in the neighbourhood which would have graced any stand from any place.

In the nurserymen's class for seventy-two there were but two competitors, Messrs. Harkness & Son, and Messrs. Paul & Son, to whom the first and second prizes were awarded in the order named. Both were exceedingly good stands for the season, but the Yorkshire flowers were brighter and fresher. The flowers were the following—Duchesse de Montpensier, Captain Christy, Sénateur Vaisse, Madame Montet, Comtesse d'Oxford, Madame Susanne Rodocanachi, Comte de Paris, Alfred Dumesnil, Constantin Fretiakoff, Comte de Raimbaud, The Bride, Sir Rowland Hill, Innocente Pirola, Madame Hippolyte Jamain, Countess of Rosebery, Mrs. John Laing, Marie Verdier, Duc de Wellington, Baroness Rothschild, Charles Darwin, Queen of Queens, Fisher Holmes, Francisca Kruger, Madame Charles Crapelet, Thomas Mills, Ulrich Brunner, Mrs. George Dickson, Mrs. Harry Turner, Etienne Levé, Duchesse de Morny, Auguste Rigotard, Sophie Coquerel, Prince Arthur, Princess Beatrice, Duke of Edinburgh, Souvenir d'Elise, Xavier Olibo, Horace Vernet, Jules Finger, Dupuy Jamain, Louis Van Houtte, La France, Marshall P. Wilder, Emilie Hausburg, Camille Bernardin, Catherine Mermet, Pierre Notting, Lady Sheffield, Marie Baumann, Madame E. Verdier, Harrison Weir, Pride of Waltham, Charles Lefebvre, Heinrich Schultheis, Alfred Colomb, Merveille de Lyon, Madame Angèle Jacquier, Duke of Connaught, Madame de Watteville, Duchess of Bedford, Niphotos, John Stuart Mill, Comtesse de Nadaillac, A. K. Williams, Roisieriste Jacobs, Silver Queen, E. Y. Teas, Lady Mary Fitzwilliam, Madame Hausmann, Reynolds Hole, Dr. Andry, and Madame Gabriel Luizet. Messrs. Paul and Son were, as I have said, second.

In the class for thirty-six trebles Messrs. Paul & Son were the only exhibitors; their flowers were Madame Victor Verdier, Madame Charles Crapelet, Duke of Edinburgh, Niphotos, Comte de Raimbaud, Baroness Reynolds Hole, Sénateur Vaisse, Her Majesty, Marie Rady, Beauty of Waltham, Merveille de Lyon, Duke of Teck, Etienne Levé, A. K. Williams, Mdlle. Susanne Rodocanachi, Charles Lefebvre, Princess of Wales, Ollivier Delhomme, Pride of Waltham, Prince Arthur, Dr. Andry, La France, Camille de Rohan, Ella Gordon, Comtesse de Nadaillac, Maurice Bernardin, Marie Verdier, Marie Rady, Pierre Notting, Marshall P. Wilder, The Bride, Madame Norman Néruda, Mons. E. Regel, Horace Vernet, Baroness Rothschild, and Abel Carrière. In the class for thirty-six singles, Messrs. Alex. Dickson of Newtownards, Co. Down, Ireland, were first with an excellent stand of the following flowers—Ulrich Brunner (a splendid bloom), Marquise de Castellane, Baroness Rothschild, Mrs. John Laing, Sénateur Vaisse, Marie Baumann, Alfred Colomb, Merveille de Lyon, Etienne Levé, Her Majesty, Prosper Laugier, Mdlle. E. Verdier, Emilie Hausburg, Earl of Dufferin (very fine), François Michelin, Marshall P. Wilder, Pride of Waltham, Horace Vernet (a grand bloom), Duchesse de Morny, T. W. Girdlestone (a most promising flower of a bright cerise red), Marie Finger, Madame Alphonse Lavallée (a very Marie Baumann-like flower), Marie Verdier, Général Jacqueminot, Elie Morel, Annie Wood, Egeria, Louis Van Houtte, La France, Beauty of Waltham, Comtesse de Serenye (one of the cleanest blooms of this flower I have ever seen), Triomphe de Caen, Francisca Kruger, Marie Rady, and Abel Carrière. Messrs. Burch & Son of Peterborough were second; and Messrs. Dickson, Limited, Chester, third.

In the class for eighteen trebles, Messrs. Burch were first with Her Majesty, Horace Vernet, Reynolds Hole, Merveille de Lyon, Alfred Colomb, E. Y. Teas, Charles Darwin, Queen of Queens, Louis Van Houtte, Duchess of Bedford, Roisieriste Jacobs, Xavier Olibo, A. K. Williams, Lady Sheffield, Lord Macaulay, Lady Mary Fitzwilliam, Marie Baumann, Marie Verdier, and Horace Vernet. In the class for eighteen Teas, Messrs. Paul & Son were first with Souvenir d'un Ami, Niphotos, Maréchal Niel, Souvenir d'Elise, Madame Cusin, Madame Angèle Jacquier, The Bride, Francisca Kruger, Miss Ethel Brownlow, Alba rosea, Marie Van Houtte, Comtesse de Nadaillac, Catherine Mermet, Perle des Jardins, Madame de Watteville, Jean Ducher, Etoile de Lyon, and Hon. Edith Gifford.

Amongst amateurs Mr. W. J. Grant took the lead, showing in that marvellously fine style which has characterised his flowers this year. He took first prize in the class for thirty-six single blooms, with fine blooms of Marquise de Castellane, Star of Waltham, Heinrich Schultheis, Duke of Edinburgh, Lady Sheffield, Marshall P. Wilder, Annie Wood, Merveille de Lyon, Sénateur Vaisse, Alfred Colomb, Prince Arthur, Reynolds Hole, Countess of Rosebery, La Rosière, Charles Lefebvre, Mdlle. Susanne Rodocanachi, Comte de Raimbaud, Duchesse de Morny, Duchess of Bedford, Madame Charles Crapelet, Duc de Wellington, Baroness Rothschild, Horace Vernet, Ulrich Brunner, Abel Carrière, Madame Cusin, Dingée Conard, Beauty of Waltham, Xavier Olibo, Emilie Hausburg, A. K. Williams, and Le Havre. The Rev. J. H. Pemberton was a good second, and Dr. Budd of Bath third. In the class for twenty-fours Mr. Wm. Boyes of Milford, Derby, was first with Heinrich Schultheis, Louis Van Houtte, François Michelin, Horace Vernet, Merveille de Lyon, Countess of Rosebery, Comte de Raimbaud, Ulrich

Brunner, Duchess of Albany (very like La France), Duchesse de Morny, Xavier Olibo, Star of Waltham, Le Havre, Gloire Lyonnaise (a pretty bloom), Marie Baumann, Camille de Rohan, The Bride, A. K. Williams, Baroness Rothschild, Duc de Wellington, Sophie Fropot, Roisieriste Jacobs (a very fine bloom), Madame Lami, and Ferdinand de Lesseps. In twelve trebles Mr. W. J. Grant was first with Marie Verdier, Dupuy Jamain, Her Majesty, La Rosière (very fine), Ulrich Brunner, La France, Abel Carrière, Général Jacqueminot, Niphetos, Alfred Colomb, Comtesse de Nadaillac, and Charles Darwin.

For twelve Teas Mr. Grant was first with fine blooms of Adam, Marie Van Houtte, Madame Cusin, Caroline Kuster, La Boule d'Or, Catherine Mermet, Comtesse de Nadaillac, Maréchal Niel, Souvenir de Thérèse Levet, Madame de Watteville, Niphetos, and Souvenir d'un Ami. The Rev. J. H. Pemberton was a good second. In the class for any one light Rose Mr. J. G. Churton of Neston was first, as he was also in the class for twenty-four varieties, local growers. His flowers were Ulrich Brunner, Madame Gabriel Luizet, Duc de Rohan, Merveille de Lyon, Ernest Prince, Marie Finger, Prince Arthur, Ferdinand de Lesseps, La France, Lord Macaulay, Baroness Rothschild, Louis Van Houtte, Magna Charta, A. K. Williams, Star of Waltham, Her Majesty, Reynolds Hole, Antoine Mouton, Alfred Colomb, and Marie Rady. This box secured the N.R. Society's gold medal. J. Hodgson, Esq., was second. In the class for eighteen single the Rev. Canon Fielden was first with John Stuart Mill, Baroness Rothschild, Beauty of Waltham, Merveille de Lyon, A. K. Williams, Mrs. George Dickson, Marie Rady, Magna Charta, La France, Dupuy Jamain, Madame Gabriel Luizet, Star of Waltham, Captain Christy, Duc de Wellington, Marie Baumann, Fisher Holmes, Sénateur Vaisse, and François Michelin. H. V. Evans, Esq., was second.

In the class for twelves, a very beautiful box of blooms was exhibited by Desborough Walford, Esq., of Spital, consisting of Captain Christy, Duke of Edinburgh (a magnificent bloom), Baroness Rothschild, Marie Baumann, François Michelin, Sophie Fropot, Madame Gabriel Luizet, Charles Lefebvre, Madame Hippolyte Jamain, Le Havre, Etienne Levet, and La Rosière. The bloom of Duke of Edinburgh received the N.R.S.'s silver medal for the best bloom in the amateur classes. Believing, as I do, that the true colour of this fine flower is brilliant scarlet without any shading, I consider this to have been one of the finest blooms of this flower which I have ever seen, and the whole box was a creditable one to have cut from less than a hundred trees. Mr. W. E. Hall was second, and the Misses Squarry third. In the class for six of any one variety T. W. Crowther, Esq., was first with Baroness Rothschild, and Mr. Desborough Walford second with Captain Christy. In the class for six varieties T. R. Buller, Esq., was first with Baroness Rothschild, Comte de Raimbaud, Duchesse de Morny, Duc de Wellington, Merveille de Lyon, and Emilie Hausburg. Dr. Bell was second, and A. J. Greenshields, Esq., third. In the class for six Teas Canon Fielden was first with Madame Lambard, Caroline Kuster, Francisca Kruger, Comte de Paris, and Madame Hippolyte Jamain.

Two of the best boxes of new Roses I have seen for many a long day were contributed by Messrs. Alex. Dickson & Sons of Newtownards and Messrs. Paul & Son of Cheshunt, Messrs. Dickson taking first prize. The fact is that now, instead of being dependent on blooms cut from imported plants which have been worked to death, so many good blooms are now being raised in our own country that we get finer and better blooms. Messrs. Dicksons' stand contained Caroline d'Arden, one of their own raising (a very pretty, large, light coloured flower), Mrs. John Laing, T. W. Girdlestone (another of their seedlings, a bright cerise red with large petals and very fragrant), Duchess of Albany (a deeper coloured La France), Lady Alice (just like Lady Mary Fitzwilliam), Earl of Dufferin (very fine), Her Majesty, Prosper Laugier, Jeanne Dickson (a small bloom of a very promising variety), Silver Queen, Lady Helen Stewart, and Lady William Hill (a very promising light flower of the Pride of Waltham type).

Messrs. Paul & Sons' box contained Prosper Laugier, Her Majesty, Sir Rowland Hill, Madame Norman Néruda, Mrs. John Laing, Madame Henry Persire, Madame Joseph Dubois (a beautiful white flower), and Madame Baulot (very like Alfred Colomb), Madame Hoste, Madame Treyve, Marie, and The Bride.

A very interesting feature of the Exhibition was the division for hardy perennials. Stands were exhibited by the Rev. Lionel Garnet, Desborough Walford, Esq., R. Bullen, Esq., while a very fine collection was exhibited by Messrs. Dickson of Chester. The taste for this class of flowers is evidently increasing in the neighbourhood, and both soil and climate seem suitable for their cultivation.—D., Deal.

HELENSBURGH.—JULY 18TH.

JUST as we are preparing for press we are requested to insert a newspaper report of this Show. We regret our inability to do more than publish the following summary:—"The exhibits amounted to 2113, showing an increase of 695 over last year, and being the largest number since 1883. The number of competitors also showed an increase over last year. As in former years the principal prize was secured by Messrs. Dickson and Sons, Newtownards, County Down, for their stand of sixty blooms, distinct varieties, and the same firm also carried off the prize for the best hybrid Rose in the Show—a fine Alfred Colomb. For Tea Roses, Messrs. D. & W. Croll, Dundee, secured the honours, and were also awarded the prize for the best Tea Rose—a splendid Marie Van Houtte—in the Show; and in the section given to Scotch growers only, the same firm secured the National Rose Society's medal. The gold medal

for amateurs was won by Mr. David Wallace, Lincoln; while Mr. Massland, Helensburgh, was again successful in winning the medal in the section confined to Dumbartonshire."

HORTICULTURAL SHOWS.

WOLVERHAMPTON.

FOR some years Wolverhampton has not had a summer show, but it was thought expedient to hold one this year, and a three-days exhibition was decided upon, and prizes to the amount of about £230 were offered. The days fixed (July 16th, 17th, and 18th) proved to be fine, and the Wolverhampton Public Park—one of the finest in the kingdom, reflecting much credit upon the Superintendent, Mr. Thomas, for its display of flowers just now and excellent keeping—is just the place for a large flower show.

For sixteen stove and greenhouse and ornamental plants, Mr. Cypher, Cheltenham, was first with a grand lot, consisting of Crotons Sunset, 6 feet through; C. Victoria, larger still; C. Thomsoni, superbly coloured; Cycas circinalis, 9 feet high; a grand *Latania borbonica*, *Cordylina indivisa*, a *Phœnocomia prolifera*, wonderfully fine; *Ericas Irbyana* and *Parmentiera rosea*, both extra fine; *Ixoras Frazeri*, regina, and *salicifolia*; excellent plants of *Clerodendron Balfourianum* and *Statice profusa*, and two Palms. Mr. J. Marriott, Coventry, was a good second with fine plants. *Ixora Duffi* was especially noticeable for its large trusses of well coloured flowers; and very good were *Erica Parmentiera rosea* *Statice profusa*, *Erica Shannoni*, and a richly coloured *Croton Johannis*. For six exotic Ferns Mr. Cypher was first with a fine lot, *Cibotiums regale* and *princeps*, *Alsophila australis*, *Dicksonia antarctica*, *Gymnogramma chrysophylla*, and *Microlepia hirta cristata*. Mr. Marriott second, in whose lot was a fine mass of *Hymenophyllum triehomanes*. For six plants in flower Mr. Cypher was again first with *Ericas Jubana* and *Parmentiera rosea*, *Kalosanthos coccinea*, *Allamanda grandiflora*, and *Ixoras Pilgrimi* and *Williamsi*; second, Mr. Marriott. Some very fine Palms were set up. First, Mr. Cypher; second, Mr. Marriott. The first prize for a group, not to exceed 140 square feet, was well won by Mr. W. H. Dyer, gardener to Mrs. Marigold, Edgbaston, Birmingham, but the other groups were much below the standard of merit usually met with.

For forty-eight distinct varieties of Roses, Messrs. Cranston & Co. were first with Ulrich Brunner, La France, Madame Charles Wood, Paul Neyron, Barthelemy Joubert, Dupuy Jamain, Star of Waltham, Heinrich Schultheis, Sénateur Vaisse, Princess Beatrice, Alfred Colomb, François Michelin, Exposition de Bric, Countess of Oxford, Marie Baumann, Duke of Edinburgh. Second row: Madame Charles Crapelet, Roisieriste Jacobs, Merveille de Lyon, Dr. Andry, M. Alfred Dumesnil, Countess of Bedford, Duchesse de Morny, Général Jacqueminot, Madame Marie Finger, Prince Camille de Rohan, Countess of Rosebery, Etienne Levet, Marie Rady, Alphonse Soupert, J. S. Mill, Pierre Notting. Third row: Prince Arthur, Marie Verdier, Eclair, Etendard de Jeanne d'Are, Reynolds Hole, Baroness Rothschild, Louis Van Houtte, Madame Gabriel Luizet, A. K. Williams, Anguste Rigotard, E. Y. Teas, Francisca Kruger, Earl of Pembroke, Captain Christy, Duke of Wellington, and François Levet. Second, Messrs. Harkness and Sons. For thirty-six blooms, first, Messrs. Perkins & Sons, Coventry, with Ulrich Brunner, Louis Van Houtte, Countess of Rosebery, Roisieriste Jacobs, Mrs. John Laing, Dr. Andry, La France, Star of Waltham, Elie Morel, Comtesse de Camando, Marie Baumann, Horace Vernet, Devienne Lamy, François Michelin, Harrison Weir, M. Niel, C. Lefebvre, Marguerite D'Ombraïn, Prince Arthur, Madame E. Verdier, E. Y. Teas, Captain Christy, A. K. Williams, Abel Grand, Marquise de Castellane, Sénateur Vaisse, Merveille de Lyon, Eclair, Beauty of Waltham, Annie Wood, Emilie Hausberg, Charles Darwin, Madame Eugène Verdier, May Quennell, Baroness Rothschild, and Madame Alfred Dumesnil. Second, Messrs. Cranston & Co.; third, Messrs. Harkness & Sons; fourth, Messrs. Dicksons, Chester. In the class for twenty-four Roses, first, Messrs. Perkins & Sons; second, Messrs. Cranston & Co.; third, Messrs. Dicksons. Twelve dark Roses, one sort, first, Messrs. Cranston & Co. with Alfred Colomb; second, Messrs. Dickson with Horace Vernet. For twelve light Roses, one sort, first, Messrs. Cranston with La France; second, Messrs. Dicksons with Merveille de Lyon. All the exhibits we have named were in the open to all class. The Roses were generally very good.

In the gentlemen's gardeners' classes Mr. W. H. Dyer was again first for a group nicely arranged, first for six stove and greenhouse plants, and first for six Ferns. Mr. Marriott, Coventry, staged six good Orchids—viz., grand masses of *Lælia purpurea* and *Cattleya Gaskelliana*, *Odontoglossum vexillarium*, *Cattleya gigas*, *Acridos callosum*, and *Odontoglossum Alexandræ*; only this lot staged. Good Ferns were staged, two lots of four *Coleus*, one lot of six *Fuchsias* of indifferent quality, and a poor display of *Tuberous Begonias*. Mr. R. Willcocks' first-prize lot of six *Zonal Pelargoniums* were well grown. In the cut flower department Mr. J. Marriott was first for twenty-four varieties of cut flowers with a fine lot, and the second-prize lot were good. Bouquets were not well represented. Fruit was a poor display. Some good vegetables were shown, and the amateurs' and cottagers' classes were well filled; but the general arrangements of the Show were very faulty, and need of a master hand in the general arrangements was felt.

The honorary exhibits of the Show were of a very meritorious character. Messrs. Thomas Hewitt & Co. had a good display of cut

herbaceous blooms, Picotees and Carnations, Gaillardias, Ivy-leaf Pelargoniums in pots, and other things. Mr. Arthur Brown, florist, Handsworth (son of the late veteran Sam Brown), had a good lot of Carnations and Picotee blooms. Messrs. Vertegans, Niemand & Co., Edgbaston, a large assortment of cut herbaceous flowers, good Picotees, and Carnations, a bouquet of Picotees, Mushrooms, &c. Messrs. R. Smith & Co., Worcester, Roses and cut herbaceous blooms. Messrs. Cranston & Co. a large display of Roses. Mr. W. Dean, florist, Solihull, a collection of Violas. Mr. R. Lowe, Wolverhampton, and Mr. Knight, Wolverhampton, collections of plants. Messrs. Webb & Sons, Stourbridge, a collection of their new Peas and other vegetables; and Messrs. Sankey & Sons, Bulwell Potteries, had on the ground a prettily fitted rustic cottage, showing off a large display of garden pottery ware, for which this firm is so noted.

BEDFORD AND BEDFORDSHIRE.

THE annual Show of this Society, held at Bedford on the 17th inst., secured the patronage of many of the principal growers of Roses and herbaceous plants in response to offers of prizes open to all England, and indeed this department of the Show becomes yearly more attractive and more successful, the display of cut herbaceous and bulbous flowers having hardly been equalled elsewhere this season, both sides of the centre table of the Rose tent being well filled, and admirably arranged with large bunches of all the best showy and newly introduced plants. The local department for vegetables was also well represented, and more than sustained the reputation the county holds as a producing district for green food, the exhibition of fruit and plants, on the contrary, being weak for this favourable and mansion-studded county. Notable exceptions, however, to this otherwise ineffective part of the Show were six well-grown and finely bloomed Fuchsias from Mr. Galloway, gardener to Miss Rice-Trevor, Bromham Hall; some good Coleus and Ferns from Mr. Robinson, gardener to F. Howard, Esq., Abbey Close, Bedford; a well arranged group of plants from Mr. C. Ellis, gardener to Mrs. Orr, Pemberley, Bedford, and Zonal Geraniums from Mr. Herman, gardener to Griffith Jones, Esq., Goldington, to all of which first prizes were awarded in their respective classes. The fruit, too, from Mr. G. Allis, Old Warden Gardens, well sustained his reputation as a successful grower, and scored for him first prizes for a collection of six kinds, Pines excluded, for white Grapes, Peaches, Nectarines, and Strawberries, the other chief prizes in the fruit classes falling to Mr. Galloway and Mr. Day, gardener to J. Hawkins, Esq., Mayor of Bedford. There was also an interesting and attractive display of wild flowers and grasses, both fresh and dried, botanically named, the competitions being especially strong amongst the young people attending the Bedford Schools, and the Judges were well occupied for several hours in disposing of many well earned awards.

Roses, as an important feature of the Show, were largely staged, chiefly in bright colour, but wanting somewhat in size. In the open class for forty-eight distinct blooms Messrs. G. and W. H. Burch, Peterborough, secured the leading place with a fresh and striking stand, consisting chiefly of H.P.'s, the following varieties being well represented—viz., Reynolds Hole, Duc de Wellington, Comtesse de Camando (a new and fuller Rose of the Charles Lefebvre type), Her Majesty (very fine), Charles Darwin, Mrs. Jno. Laing, Xavier Olibo, Niphetos, Duchess of Bedford, Madame de Watteville, A. K. Williams, Silver Queen (a clear light pink of the Christy type), Madame Victor Verdier, and Horace Vernet. Mr. H. Merryweather, of Southwell Nurseries, Notts, ran close for second, his best blooms being Earl of Dufferin, Pride of Reigate, Viscountess Folkestone, Longwood Rambler, Sir Rowland Hill, and Brilliant (good dark red). Messrs. Paul & Son, Cheshunt, came third with good blooms, but a little past; Lady Helen Stewart (very fine), Madame A. Dumcsnil, Pride of Reigate, and Madame H. Pereire were noticeable amongst the newer varieties in their stand. Mr. J. Mattock, of Headington, Oxford, had probably the best stand intended for this class, but arrived too late for competition. He had very fine blooms of Star of Waltham, Chas. Darwin, Mrs. H. Turner, and Madame Mallet, a distinct light silvery pink with deeply serrated petals. There were also two other exhibits in this class.

Teas were only in moderate and seasonable condition. In the open class for eighteen Messrs. J. Burrell & Co., Cambridge, were placed first, The Bride, Niphetos, and Madame de Watteville being amongst their best blooms. The Rev. W. H. Jackson, Stagsden Vicarage, was second. For twenty-four cut blooms, open to all amateurs, E. B. Lindsell, Esq., Bearton, Hitchin, led with a fine stand, containing Ulrich Brunner, A. K. Williams, Merveille de Lyon, Chas. Darwin, Marie Verdier, Reynolds Hole, Dr. Andry, and Beauty of Waltham, all in beautiful condition. The Rev. W. H. Jackson was second. For twelve Teas and Noisettes, open to amateurs in the same division, Mr. Lindsell was again first, and Mr. Jackson second; and for twelve distinct Roses (open to all amateurs) Mr. G. Moules, Hitchin, came first; and the Rev. W. H. Gall, Hitchin, second. In the local classes for Roses and cut flowers the principal prizewinners were the Rev. W. H. Jackson, Mr. J. T. Green, and Miss Thomas, Bletsoe; the Rev. Paul Wyatt, Mr. L. C. Higgins, and Mr. W. Kingston, Bedford.

The most striking feature of the Show, however, was the open class for thirty-six bunches of cut hardy herbaceous and bulbous flowers, which brought five very striking exhibits. The first prize fell to Messrs. J. Burrell & Co., Cambridge, but the position was hotly contested by Messrs. G. Paul & Son, Cheshunt, who exhibited some very choice new and rare specimens. Messrs. Burrell, however, had large bunches admirably staged, including most of the well-known showy varieties,

Oenothera speciosa and Carnation Mrs. Reynolds Hole being very attractive. In Messrs. Paul's lot the following were very conspicuous—viz., *Potentilla nepalensis*, *Cephalaria alpina*, *Centaurea ruthenium*, *Campanula pelviformis*, *Lilium dalmaticum*, *Physostegia virginiana* alba, and *Teletia cordifolia*. Messrs. Paul also showed a lovely pure white variety of *Epilobium angustifolium*. They were placed second, Mr. H. Sheppard third, and Mrs. Horton, Bedford, fourth.

Vegetables were especially good, and the Potatoes generally well ripened although not large, the first prize for a basket of twelve varieties of vegetables going to Mr. Musgrove, gardener to A. D. Chapman, Esq., Milton Ernest, Bedford, and the second to Mr. C. Ellis; Mr. Robinson taking first for a collection of Potatoes, and Mr. Herman, who had very clean and fine specimens of a white kidney of the Snowdrop type named Vicar of Coghill, second. For a collection of Peas, Mr. Catlin, gardener to P. G. Skipwith, Esq., Bedford, was first, and Mr. Ellis second. For six distinct varieties of vegetables, offered by Messrs. Sutton & Sons, Reading, Mr. Hermon was first, and Mr. Musgrove second. In the classes for amateurs not regularly employing a gardener, the chief prizewinners were Mr. W. Kingston, Bedford, for a very fine collection of Peas, consisting of Evolution, Duke of Albany, Ne Plus Ultra, and Omega; Mr. A. Burton, Biddenham, for a collection of vegetables, and also for plants; Mr. W. Quarry, Bedford, for Roses and cut flowers; J. W. D. Harrison, Esq., Bedford, for bouquets, plants, &c., and the Rev. P. Wyatt for fruit. Mr. Day, gardener to Joshua Hawkins, Esq., taking the Mayor's prize for the best collection of horticultural produce, and first for a fine dish of Tomatoes, and Miss Beatrice Franklin and Miss Tebbs, Bedford, for devices, sprays, &c. In the market gardeners' class Mr. J. Mearry, Bedford, was first for collections of vegetables and fruit, and Messrs. S. Kirby & Son, Kempston, for salad.

A choice and attractive display of Roses, Sweet Peas, Asters, Zinnias, and other cut flowers, not for competition, were set up by Messrs. Laxton Bros., nurserymen, Bedford, and Mr. J. C. Sheppard contributed a handsome group of decorative plants in baskets. Showery weather militated against the financial success of the Exhibition, but in the evening the rain kept off for the visitors to witness the beautiful illuminated river fête, an almost unique and fairy-like scene, well carried out on the River Ouse, and which attracted and gratified large numbers from the neighbouring towns and surrounding district.

FRUIT FORCING.

PEACHES AND NECTARINES.—*Early Forced Trees.*—Those which were started from early December to the new year, whether the varieties are very early, such as Alexander, Waterloo, and Early Beatrice, or later, such as Hales' Early, Early Alfred, Dr. Hogg, A. Bec, Royal George, and Stirling Castle, have been cleared of their fruit. They have had the wood on which the fruit was borne removed, also superfluous growths, so that those retained can have light and air for perfecting the fruit buds and the maturity of the wood, which is encouraged by clean foliage and proper supplies of nutriment. The trees must be cleansed of insects if necessary, and supplied with water, or in the case of weakly trees liquid manure, at the roots. Mulching will also tend to keep the roots active near the surface, and prevent the premature ripening of the foliage. The buds will be sufficiently plumped and the wood sufficiently ripened to allow of the roof lights being removed, which should not be further delayed. This is a commendable practice, not the least of its advantages being the thorough moistening of the border by the autumn rains.

Succession Houses.—Trees started in February have the fruit ripe, and some are still ripening, being later than usual on account of the cold and dull weather that prevailed in the early summer months. The fruit seems, however, to have benefited both in size and quality by the longer time. As the fruit is cleared off cut out the wood that has borne it, and thin the growths where too close, or where they are so close that the foliage cannot have exposure to light and air. Cleanse the trees of dust by means of the syringe or engine with water, and of red spider or other insect pests with an insecticide. Keep the border moist, giving liquid manure if the trees have carried heavy crops, are at all weakly, or do not plump the buds. Stop all laterals to one joint, or allow a little extension if the trees have the blossom buds in an advanced state, preventing premature ripening of the foliage by continuing the root action, though the principal buds must not be forced into growth. When the buds are well formed and the wood well matured, remove the roof lights. The exposure to rains and dew has an invigorating effect.

Trees Swelling their Fruit.—This is the case with those started in March. We find the best results follow attention to three conditions—viz., 1, a border composed of rather strong loam, with some clay marl in it, a source of potash and lime, old mortar rubbish or chalk, which seems to have effect in proportion to the phosphoric acid, some containing as much as 7 per cent; 2, good drainage, neither too wide nor too deep borders, 2 feet sufficing as regards depth, and half the width the

trees have of trellis, duly watered and fed from the surface, the manures being phosphatic—i.e., where there is a tendency to soft growth using mineral as coprolites, and superphosphate ordinarily; 3, the shoots thinly trained; no overcropping or neglect of thinning in the early stages, and a genial atmosphere so as to insure steady progressive growth.

The leaves should be drawn aside and the fruit raised by means of laths across the trellis, so that the apex will be exposed to the light. Water the border inside and outside with liquid manure, and keep the surface mulched with rather lumpy manure. Avoid a close fine surface likely to form a soapy mass, and exclude air. Ventilate early, in fact leave a little air on all night, syringing by 7 A.M., and through the early part of the day ventilate freely. When the sun loses power in the afternoon reduce the ventilation, and raise the temperature to 85° or 90° about 4 P.M. with a good syringing and damping of surfaces, but it must be done with judgment, for when the water hangs for any length of time on the fruit during the last swelling it is liable to damage the skin, causing it to crack, or if not that, it may impart a musty flavour, therefore have the fruits dry before nightfall, and when the day is likely to be dull omit the morning syringing. Directly the fruit commences ripening cease syringing, but afford moisture by damping available surfaces, especially the border whenever it becomes dry, ventilating rather freely, and sufficiently at night to insure a free circulation of air.

Late Houses.—The fruit in these is later than usual; in fact, there will be little need to retard the ripening by having recourse to very abundant night ventilation. In order to assist the swelling observe the conditions laid down in the preceding paragraph. To accelerate the ripening, if required, ventilate rather freely in the early part of the day and till one o'clock, then conserve the heat by reducing the ventilation so as to secure 80° to 85°, and about 4 P.M. close the house, syringing well, and no harm will come if the temperature rise to 90° or 95°, ventilating a little about six o'clock so as to let the pent up moisture escape, and the temperature gradually cool down. Tied down as growths advance, allowing no more than are necessary for next year's fruiting, or for furnishing the trees, letting all have space for development, and the full exposure of the foliage to light and air. Keep laterals stopped to one leaf, also retain growth to attract the sap to the fruit. If there are any gross shoots which push laterals from the leaf buds, cut them back to where the buds remain intact, or if likely to disarrange the equilibrium of the trees, the equalisation of the sap, cut them out altogether. They only tend to promote gumming, imperfect setting, and certain casting of the fruit in stoning. Draw the leaves away from the fruit, raise it from the under side of the trellis, and let it have as much sun and air as possible. Peaches are not much prized unless coloured, the flavour corresponding thereto, other conditions being favourable.

KITCHEN GARDEN.

CABBAGES FOR SPRING.—The spring Cabbage crop is one of our most important, and should be as early and good as possible in March or April. For private use Cabbages are much valued then, and in the market they invariably command remunerative prices. It should, therefore, be the aim of all to make earliness a feature in their culture. This depends to a considerable extent on the time the seed is sown. We have sown at various times, and prefer the end of July or the beginning of August. We are not particular to a day or two one way or the other, but our Cabbage seed will be sown very shortly after the publication of this note. Care should be taken to select a known early variety. The seed rarely fails either sown broadcast or in rows in rich well prepared soil. One of the best positions in the garden should be chosen for the seed bed. Thin sowing gives the most robust plants. When the ground is very dry we open drills, water them well, sow an hour or so afterwards, and cover immediately. This insures rapid and free germination.

TOMATOES.—The season is proving an admirable one for Tomatoes in the open air. We have quantities of fruit ripe on a south wall. There is no secret in their culture, or one of the gamekeepers who put out some of our plants against his cottage would not have such fine ripe fruit as he enjoys. There is no indication of disease, and so long as the growths are kept well thinned fertilisers may be given, but only to plants bearing heavy crops. Any that are not yet in fruit should only have pure water and not too much of this, as a check to luxuriance induces fruitfulness, high feeding encouraging sterility. Expose the fruits to the sun, and cut all those off as fast as they ripen.

VEGETABLE MARROWS AND RIDGE CUCUMBERS.—The warm dry weather has induced these to fruit early and heavily. The tender young Marrows cut in July have been very acceptable. It is only when young and tender that they are good, and if the fruits become so numerous that they cannot all be used they should be cut and disposed of before the skin becomes hard, as when they begin to form seed bearing soon ceases. This also applies to ridge Cucumbers, and it is too early in the season yet to allow either to be checked from such a cause. Should the plants be growing on manure heaps, and producing many superfluous shoots, keep these well thinned, as it is only short-jointed well-exposed shoots that produce fruit at every joint.

ENDIVE.—The Broad-leaved Batavian is a general favourite, as it is hardier than the curled varieties and heavier, while in quality it is as good as any. All who are in favour of Endive for salad should sow freely now, as when sown too late the plants fail to attain the full size and hardiness before the frost comes. The seed may be sown thinly in rows to allow of some of the plants being left permanently, drawing others for transplanting.

EARLY SEED POTATOES.—It is a good plan to leave some of the early Potatoes in the ground for seed till the stems are completely

withered, as the tubers are only then completely ripe; at the same time they must not be left too long, or they will start growing after a rest and rain.

SPENT CROPS.—Many of the midsummer crops are considerably past their best, and ought to be removed without delay to make room for winter Turnips, autumn Spinach, and Greens. Where Peas have been growing in trenches, so soon as they are removed a row of Celery may be put in without any further preparation than clearing the surface. Pea stakes that were new this spring may be stored for use next season, as they are useful the second year to mix in with a few fresh ones.

EARTHING UP CELERY.—We were afraid that the drought would induce many of our Celery plants to form stems, but so far we have not observed any, and the earliest plants are now ready for their first earthing. We begin by giving them a thorough soaking of liquid manure, then a few of the lower leaves are removed, the soil is broken fine and put round each plant without allowing any of it to fall into the centre. To prevent this a piece of matting may be tied round each plant before earthing is commenced, and removed when finished.

AUTUMN-SOWN ONIONS.—The hot weather has suited these, and many of them are of fine size and form, but should rain come they will soon split. This spoils them for keeping or exhibition, and it is a good plan to examine them weekly and draw up the best bulbs before they become deformed. They may be suspended in a cool shed immediately after being taken from the ground.

THE BEE-KEEPER

NOTES ON BEES.

THE HEATHER SEASON.

AFTER welcome rains we hope sunshine will be the rule for some time to come. Few hives will require feeding this year, and as the Heather season is nearly upon us they are in splendid condition for making the best of fine weather. Hives which generally do best at the Heather are those having young queens at their head, with an abundance of brood in large-sized hives. These essentials prevent swarming and secure ample store combs when a honey glut comes, which, as is well known, is greater from Heather than any other bee pasturage. The hives should be secured so that no bees can escape, and ventilated for preventing suffocation and incipient foul brood. Vehicles having light springs should be employed, and shallow frames are suitable for safe travelling and for depriving purposes. Where choice of site can be had always select that most sheltered, as, like covering supers well, it enables the bees to build combs during the nights, which are often colder in August and September than in June or July. The direction hives stand is of less importance provided the wind does not blow hard on their entrances. Do not spare the covering, but have ample, so that the heat of the sun does not penetrate the interior, which is apt to melt the combs, prevent the bees working, and thus greatly lessening the yield of honey.

BEES FOR PROFIT.

That bees yield a profit greater than that derived from any other rural occupation there is no question, but we prefer to see the number of bee-keepers increased rather than extensive and fewer apiaries. There are many striving cottagers who, from the overwhelming number of bees in extensive apiaries in the neighbourhood, are prevented keeping bees in a satisfactory manner.

GOOD SEASONS.

These are always wished for and welcomed, but are sometimes absent. This we cannot help, but often in the poorest season there is a surplus of honey if the management be judicious. We wish everyone to share in the gracious gift of honey, and most families can consume the produce of two or three hives. There is further a large demand for genuine honey of the first quality, but it is to be regretted that by the too lavish use of comb foundation the quality is not often what it might be.

It is well known that some writers like ourselves have encouraged people to engage in bee-keeping. One adviser in a contemporary, after congratulating those bee-keepers who were fortunate in bringing their hives safely through the winter, further congratulates them on the misfortune of their neighbours, adding that if all had

lived "Honey would have been a glut in the market, and unsaleable." If this be really the case is it right to encourage bee-keeping? and would it not be better to cry Halt?

We are of the opinion that bee-keeping as we advise will continue, as it has formerly done, to be a profitable occupation, and that there will always be a demand for superior samples of honey and honeycomb.

WINTER PREPARATIONS.

Never winter bees with less food than will last the stock till May or June next, nor with other than a fertile queen of the current year. These two essentials, and having the hives wind and water tight, all management practically ceases from September till the following May.

TWO SIZES OF HIVES.

We have frequently advised the use of full-sized hives, but there are exceptions. All hives intended for supering or for extracting should for the stock hive be in no less than the three divisions, containing the shallow frames, which are best for transit, extracting, and building up colonies for swarming purposes. One box less does not reduce the hive to a pigmy size, being only a third, which upon a full-sized hive is often at the end of the season full of honey, to be avoided in a hive for swarming.

When storifying hives are managed as directed it is easy to keep them within proper limits, preventing increase. When a storified hive unexpectedly swarms contrary to your wishes, do not return it, but place in a hive fitted with foundation or combs, which in a well-regulated apiary are never absent; transfer the supers from the parent to the swarm at once, and gradually, the combs containing brood and young bees adhering, unless nuclei be wanted. This does not put a stop to the filling of supers, but rather hastens them, as swarms always work with alacrity.

The swarmers will arrive at swarming point from three to four weeks earlier than will those in full-sized hives. This is important, as it gives a supply of young queens early and at the proper time. Where there are a number of swarming hives kept it is advisable to unite two or more. The number kept should not be less than will give sufficient young queens for the present and next season.

To prevent the increase of hives is the desire of many, and can be accomplished in various ways. The old-fashioned method was to allow a first and second swarm to issue, all to work separately throughout the summer; the old stock and the first swarm were taken in the autumn and the bees joined to the second swarm, after the old queen of the prime swarm was destroyed. This insured extra strong hives for wintering and early swarms next spring, and I question if any other system has remunerated the bee-keeper better.

A good plan in keeping bees is to have for every six or ten non-swarmers one swarmer. If increase of hives is desirable more of the latter should be kept. Ten days or so after the hive sends forth its swarm the stock hive ought to be divided into the proper number of nuclei, and placed in juxtaposition to the storified hives, so that bees may not be lost when uniting through changing the site. After the honey season is closed the storified hives may be examined, their queens removed, as well as the surplus filled and sealed combs, surplus drone combs, and some of the oldest combs, for it is a good point in bee management not to allow the combs to be old. Of course, these vacancies will be filled with the fresh combs formed by the nuclei.

Allow a week to pass after the old queen has been deposed, then excise all royal cells. After another day is past the bees and queen of the nucleus may be given to the old stock without further ceremony, but it is wise to cage the queen for a time if the bee-keeper lacks knowledge of the intentions of the bees by their behaviour.

The foregoing is a reliable and good way of preventing the increase of bees, and having extra honey gathering hives next spring.—A LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUE RECEIVED.

L. Späth, Rixdorf, Berlin.—*Bulbs.*

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Souvenir de Malmaison Carnations (A. B. C).—Your letter did not reach us in time to be satisfactorily answered this week.

Celeriac Failing (Somerset).—We have not the slightest idea where you can procure plants of this vegetable. We do not know that they are grown for sale.

Bury and West Suffolk Show (Alfred Bishop).—Had the report arrived a day sooner it might possibly have been inserted, or some of it, for newspaper reports are rarely suitable for our columns. If we have not made a mistake in counting you won sixteen first prizes, three seconds, and two thirds—a very creditable performance. Your remark about the "duties of the horticultural Press" is perhaps superfluous.

Caterpillars on Pear (J. B. H.).—These are the larvæ of a species of sandfly, *Tenthredo Pyri*; they are sometimes called slug-worms, and are allied to a familiar species which infests the Plum and Cherry. As they undergo pupation in the earth, it is desirable to remove the surface soil around trees that have been attacked. They may be cleared off trees by a wash of tobacco water or lime water, to which some soap is added.

Tomato Leaves Discoloured (Agnesta).—The leaves appear as if the plants had been kept too close and moist, and possibly air has not been admitted to the house sufficiently early in the morning. Dust the leaves with sulphur, do not wholly close the house at night, and commence opening the ventilators wider soon after the sun shines on the house. Do not overwater the plants. Had the flower sent been enclosed with the Tomato leaves it would have arrived fresh, but being sent in a separate sheet of dry paper it was withered. It is perhaps a double *Clarkia*.

Zonal Pelargonium Freak (Bridgwater).—It is not uncommon for a truss of bloom to have other smaller trusses growing out of it, this being a curious freak not easily accounted for. We have noticed it most frequently in vigorous growing semi-double varieties, and at the present time could cut numerous large trusses with several small ones springing out of them somewhat after the fashion of the old hen and chicken Daisies. In all probability the plant that has produced the truss described by you is in robust health, and the root force finds expression in the adventitious flowers.

Striking Moss Rose Cuttings (J. H. M. H.).—Moss Roses are not so easily raised from cuttings as most varieties are, but there is no reason why you should not be successful in establishing some on their own roots. The best form of cuttings are the short half-ripened growths that have just flowered, these being taken off with a heel or small slice of old wood attached, shortened to about 4 inches in length, and the lower leaves and thorns removed. Failing cuttings with heels, cut up long firm growths into 4-inch lengths. Fill well-drained 5-inch pots with sandy loam and dibble in the cuttings firmly round the sides. Place the pots in a pit, frame, or under a handlight. Keep the cuttings moist, close, and shaded from bright sunshine till rooted, then gradually harden off. Pot singly, using sandy loam and small pots, and keep them in cold frames. In the spring the plants may be trusted out in the open ground. They are usually increased by layers.

Layering Lapageria alba (M. H.).—It is useless to attempt raising *Lapageria* from cuttings, the only two sure methods of propagating them are by seed and layering. Seed should be sown very soon after it is taken from the pod, but the bulk of the plants distributed in this country are obtained by layering the long firm growths. Fill either a well drained box or pan with peaty soil, and on this coil one or more long well matured growths. Peg them down into the soil so as to just bury the stem, a peg to every joint, the leaves, however, being above ground, and if kept properly supplied with moisture—that is to say, kept uniformly moist but not saturated, roots, and eventually a young shoot, will be emitted at nearly every joint. When well rooted all may be separated, carefully lifted, and potted off singly. It is a slow process, but a sure one. We believe an expert propagator has rooted *Lapageria* cuttings as a feat of skill, but this method of increase cannot be usefully practised by gardeners.

Chrysanthemum Shoots Eaten (S. S.).—The shoots have arrived quite fresh this time, and they confirm our suspicions that either caterpillars or earwigs, or both, have injured them seriously, and one of the shoots has been punctured near the end with a minute weevil, causing the tip to curl down. You ought to have observed the attacks much sooner and caught the depredators, also applied insecticides. If the best cultivators were not more watchful and prompt in action than you have been they would not win so many prizes. Take off the worst tops and force new shoots as soon as possible, taking care they are not eaten in turn. You ask if soot water would cause injury, while in a reply just above the one to yourself we advised it to be used, and we are not in the habit of advising that which is injurious; applied weak and clear it is beneficial. You may syringe your plants every evening with either a solution of nicotine soap, Gishurst compound, or softsoap and quassia water, as may be convenient, and when the tips of the shoots are wet, dust them with tobacco powder and snuff; but you should catch the enemies as we advised last week.

Azalea indica from Cuttings (Liverpool).—Most of the plants cultivated in this country are obtained by grafting choice varieties on a vigorous growing common Azalea, and in this manner they can be the most quickly grown to a serviceable size. Cuttings are not difficult to strike, and own-root plants are usually the most dwarf in habit. The cuttings should be made from young or this season's growth, which is now sufficiently firm for the purpose. They ought to be about 3 inches long, cut to a joint, and the lower leaves trimmed off. A bellglass will be needed for covering them, and the pot used should be just large enough to enclose this inside of the rim. Well drain the pot, fill up firmly with sandy peat soil, and finish off with a thick surfacing of silver sand. Insert the cuttings thickly, taking care that they touch the bottom of the holes, and to fix them firmly, then give water through a fine rose and cover with the bellglass. A gentle heat, or from 55° to 60°, is necessary, and the cuttings must be carefully shaded. After they are rooted, which is a slow process, remove them to a cooler house, and gradually remove the bellglass. Pot singly in thumb pots, and keep them in a close frame till they have rooted into the fresh soil (fine peat and sand), pinch out their points, and keep them steadily growing, a larger shift being given as needed.

Hand and other Bouquets (O. L., Chester).—Where so many err when making hand bouquets is in crowding the materials together, the flowers crushing against and hiding each other, and this therefore you must carefully avoid. Nor is it wise to use more than two, or at the most three distinct colours, a general mixture being altogether wrong. Select the choicest and most elegant flowers, and where the stems are stout substitute pliable wire stems. Also wire all that have fine stems, including the Maidenhair fronds for surrounding the flowers. Wire suitable for binding, and for light and heavy stems, can be procured from florists or seedsmen. Wire stems are not cumbersome, and, in addition, admit of the flowers being bent in any position. It is surprising how well flowers keep in a bouquet with much of their stems removed, one preserving the other; but in binding the wires to delicate stems, such as Eucharises and Pancratiums, first surround them with either a little soft fresh moss or well moistened cotton wool. The latter ought never to be used unless it is previously moistened, as it is liable to absorb moisture from the flowers. A good central flower should be chosen, nothing being better for the purpose than a perfect half-opened Maréchal Niel, Niphetos, The Bride, Catherine Mermet, or some other Tea Rose of a delicate colour. Pass a wire or two through the tube of these, and fix firmly to a straight piece of hazel wood of near the size round of a lead pencil, this being a good foundation for the handle of a bouquet. Every flower must be bound in separately, and further, kept from wedging in with the aid of fresh, clean, and springy moss, packed behind them without showing on the upper side. Do not let the flowers fall away from the centre too rapidly, a conical bouquet being decidedly faulty; and if a rather large bouquet is needed—and it is useless to form a small one for a flower show—the outer rings of flowers must have extra long stems. After a nicely rounded, well-balanced bouquet has been made, the next proceeding should be to lighten it with the aid of single pips of Stephanotis, Tuberoses, Jessamine, Orchid flowers, Paneratiums, and elegant light green small fronds of Maidenhair Fern, nothing being better than Adiantum gracillimum. Each and all of these should have a wire stem, and be drawn down through the groundwork, and are thus left in a more natural and elegant position than is the case when they are bound in at the same time as the other flowers. That is one of the greatest secrets in bouquet making. Finish off with a good fringe of Maidenhair Fern fronds, and if these are neatly wired they can be made to recurve gracefully over the bouquet paper finally attached. A ladies' spray should be made on a foundation of either a strong Maidenhair frond, or a spray of Asparagus nanus, duly wired. All the flowers used ought also to be very neatly wired, and these again should be choice, elegant, and the colours not much mixed. Small Tea Rose buds are very appropriate for the purpose, these being taken through the centre, the smallest near the point, and surrounded by other flowers, or they may be arranged irregularly over the spray. Young, highly coloured shoots of Tea Roses, notably Sunset, are very effective in sprays. Whatever is used must be neatly bound in with fine wire, and having wire stems, the flowers needing it may be given an upward turn, so as to show them to the best advantage. Sprays are most effective when displayed on a small board covered with black velvet. Gentlemen's buttonhole bouquets ought to be neat, and consist of one or two

colours only. A single tiny creamy white or pale yellow Rose bud, with perhaps a small piece or two of Bouvardia, Forget-me-not, Stephanotis pips, neat Orchid, or some other elegant flower, backed by a frond of Adiantum mundulum, all duly and neatly wired, would be a model. The majority of the buttonhole bouquets shown are too large and common-looking, such as no gentleman of taste would care to wear.

Names of Fruits. (G. H.).—As we have many times stated Peaches and Nectarines cannot be named without good leaves for observing the glands, and information regarding the size of the flowers. The Peach arrived in a shapeless mass.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (W. H.).—1, *Oncidium longipes*; 2, *Pellionia pulchra*; 3, *Pellionia Daveautiana*; 4, *Polypodium Dryopteris*; 5, *Linaria bipartita*. (Novice).—1, *Centaurea Isnardi*; 2, *Capsella Bursa-pastoris*; 3, *Veronica Buxbaumi*; 4, *Mentha sativa*; 5, *Lysimachia Nummularia*; 9, *Polygonum aviculare*. We only name six varieties, and cannot undertake to give the names of all wild flowers that may be collected. (J. C. M.).—1 and 2, Forms of *Lilium pardalinum*; 3, *L. Martagon*; 4, *Verbascum olympicum*; 5, *Spiraea venusta*; 6, *Campanula lactiflora*. (G. R.).—1, *Achillea Ptarmica flore-pleno*; 2, *Lilium candidum* (for notes on forcing see page 55 last week); 3, one of the many unnamed forms of *Chrysanthemum coronarium*.

COVENT GARDEN MARKET.—JULY 24TH.

Supplies of soft fruit coming shorter. Hothouse goods heavy.

SOUND PASTURE.

SINCE writing the article on Pasture Farming, which was published on page 35, we have seen so many examples of neglected pasture in different counties that we return to the subject under another title, in common use enough, but which, nevertheless, has something vague and indefinite about it. The term of "sound pasture" ought not only to include that which is well drained, but is well planted also. Taken in such a comprehensive sense it would become most useful as the recognised standard of really good pasture, free from noxious weeds and stagnant water, rich in fertility, and abounding with the best possible mixture of Grasses and Clovers.

Who has such pasture? The man who laid down his land with the best mixture of seeds ought certainly to have it; but has he? We have seen new pasture almost hidden beneath a wild growth of rampant weeds, which was all the more vexatious because the seed had been sown without a corn crop in order that the plant might sustain no check nor the soil be robbed of fertility by other growth. If only the soil be made thoroughly clean either by means of a bare fallow or autumn and spring cultivation there is no reason why a corn crop should not be taken with it; but it is quite indispensable to give the soil an elaborate preparation beforehand. The only way to render soil really clean is to destroy the roots of perennial weeds, and after each time it is turned over or stirred by plough or cultivator to leave it undisturbed long enough for the germination of all seeds. No fixed rule can be given for cleaning land, the method of doing it must be determined by the state of the weather. In a fine autumn a prompt use of ploughs, cultivators, and harrows, immediately after the clearance of the corn, will enable us to extract all rubbish from the soil and burn it. In less favourable weather it has to be carted off the land. Hand labour, steel forks, and hand rakes are also useful at times, our sole object being to have the soil clean by any and every means at our disposal.

Old foul pasture requires special treatment. After careful examination we may find it worth while to eradicate the weeds by digging or grubbing, and then to break up the bare patches of soil and sow them with Grass and Clover seed. But if the pasture is very foul and the herbage coarse, rank, and worthless it may answer best to pare it, to burn the sods, spread the ashes over the surface, plough them in, and sow a mixture of really good seed for a new pasture. Very coarse herbage is usually an indication of the presence of superfluous moisture in the soil, and drainage is then of necessity an important factor in the process of renovation. When horses and cattle invariably avoid certain portions of pasture it is certain that there is something radically wrong about it, the pasture is unsound, it fails to answer its intended purpose, but probably drainage is all that is required to change the worthless growth into sweet wholesome nutritious food. We have found this to be so in our own practice, and can therefore confidently recommend drainage as the first step to be taken in the cultivation of such unprofitable pasture.

There are certain pests which are best got rid of by grubbing. When the home farm which we now manage came into our hands there were several large patches of Nettles in the pasture, which it was customary for the shepherd to mow occasionally during summer. We at once replaced the scythe with a spade and mattock, had the Nettle roots grubbed, and there was an end of them. Yet the mowing had been done for years, and our remedy was actually regarded with disfavour. The general carelessness about pasture is really incomprehensible. In making a recent

inspection of a farm famous for the excellence of its crops and its superiority to adjoining farms owing to clever management, the only weak point we saw was a small meadow in front of the farmhouse, in which *Ononis* and *Genista tinctoria* (Bastard Broom) had become so thoroughly established that it was a veritable flower garden. The cheerful effect of the blossom in such a position was the only possible excuse for a spoilt pasture, but in this instance we found there was no liking for the flowers, the weeds being regarded as a necessary evil to be kept under by mowing, but not to be got rid of because "they would come."

Many weeds disappear from pasture with drainage and the regular application of manure, but we have found grubbing necessary not only for Nettles, but also for Dock, Broom, *Ononis*, Gorse, Brambles, and we once had actually to grub a lot of stunted Whitethorn which had been suffered to become established with huge thickets of Bramble in an upland pasture. Buttercups, Mint, Chamomile, Garlic, and Tansy all spoil the flavour of milk, and should never be found in the pasture of dairy cows, nor would they be found in any pasture if it were rendered sound and brought under as careful a system of culture as it ought to be.

WORK ON THE HOME FARM.

Such speedy work was made of the haymaking that a little extra care has been required with the stacks, which when built so quickly are apt to settle down in an uneven manner as heating sets in. It is well, therefore, to wait long enough before thatching to allow them to settle, and then re-arrange the top of each stack so as to ensure the proper slope to the roof and a symmetrical appearance to the entire structure. Violent heating occurred in only one stack, the top of which sunk down to a very obtuse angle. By opening the centre to raise the sides and building up the top to the required height with Barley straw the stack was rendered both safe and dry.

Mangolds and early Swedes are now out of hand till autumn, the final hoeing having been given just when the leaves were spreading so far over the space between the rows as to ensure the keeping under of weeds. These crops are very satisfactory, as also later sown Swedes and Turnips bid fair to be, for the recent rain has been much in favour of quick seed germination and speedy plant growth. With such favourable weather for growth all possible plant singling should be done in order that the plant left for the crop may derive full benefit from the rain, and become well established in the soil before there is any risk of harm from drought.

Much of the best corn has been sadly beaten down by heavy rain, and where straw is long and weak it must remain down. It depends now upon the weather of the next three or four weeks whether we are to have a repetition of the sprouted and discoloured corn of last year. The crops generally are excellent, and the short stout straw of Square-head Wheat enables that useful variety to pass erect and unharmed through the storms which beat down sorts with longer and weaker straw. If we get new sorts of Wheat and Barley with larger ears and heavier grain, we also require more substance in the straw to enable it to support the grain in storm and sunshine. We had recently to inspect a Barley field, the growth of which was so weak that much of it could not produce ears. The tenant's grievance was that he had ploughed in a fair dressing of farmyard manure for this Barley, apparently to no purpose. The manure was taken in valuation last Michaelmas, was it worthless? As we walked over the field the odour of wild Mint crushed beneath our feet told us that the land was wet, and we were bound to pronounce that the failure of the crop was caused by water-logged soil, and not by poverty of manure.

REMARKS.

- 14th.—Slight showers at intervals, otherwise generally fine; thunder at 10 A.M.
 15th.—Heavy shower at 2 P.M., and slight shower between 1 and 4 P.M., otherwise fine and frequently bright.
 16th.—Bright warm morning; showers about 1.30 P.M. and in evening; fair between.
 17th.—Bright early; frequent thunder and occasional lightning from 11 A.M. to 5.30 P.M., heavy shower at 4.30 P.M., and frequent slight showers.
 18th.—Dull, with spots of rain in morning; bright afternoon and evening.
 19th.—Hazy, with a good deal of cloud in morning; frequently bright in afternoon.
 20th.—Showery morning; fair afternoon and evening.
 A showery week; temperature near the average.—G. J. SYMONS.

BORDER NARCISSI.
LIFTING AND REPLANTING.

ALL strong-growing Narcissi that increase quickly soon suffer from mismanagement, and no variety sooner than the double form of Poeticus. Complaints of the flowers of this variety withering in the sheath and other varieties failing to open are frequent every season. The cause is mainly, if not wholly, due to the crowded state of the bulbs and poverty of the surrounding soil. It is a mistake, and a very common one, to suppose that when Narcissi are once planted they need neither care nor attention afterwards. It is true that for a few years after planting they will do well and give satisfaction when left to their own resources; but directly the bulbs commence crowding each other they cannot attain a natural size, the growth annually becomes weaker, and the flowers and bulbs smaller until the latter fail to bloom or only produce a solitary flower or two of inferior size. To grow Narcissi well they must be lifted and replanted periodically.

If careful note is taken of a patch of bulbs crowded thickly together, and also of one in which the bulbs have been planted singly and have made robust growth, the foliage of the former will be found to have died away two or three weeks earlier than that of the latter; in fact, they are ready for lifting three weeks earlier. No particular variety need be singled out for illustration. The same conditions will be observed whether the kind is Poeticus, its double form; Horsefieldi, Sir Watkin, or the common double yellow Daffodil. The foliage as well as the flowers of crowded plants are puny in comparison with plants that stand singly or nearly so and have room to develop. Those who have Poeticus and its double form only in a crowded state would scarcely recognise them when well grown singly. The comparison is so striking that they have the appearance of being giant forms. To do Narcissi really well they should not be left undisturbed more than three or four years at the most; but this depends upon the variety and the size of the bulbs when they are planted. I am assuming that the bulbs when first planted are strong flowering ones, which commence to increase at once. If small bulbs only are planted two years may elapse before they attain full size and increase commences.

Bulbs that are left for many years in the same position and become seriously crowded are very liable to be attacked by the mite, often so seriously that they do very little good after they are planted singly. Bulbs that are lifted from time to time as they need it, and replanted in fresh ground, are kept healthy and vigorous, and therefore capable of resisting attack. I may be wrong, but I am strongly of opinion that the bulbs must be seriously checked, and their health and constitution impaired, either through poverty, overcrowding, or any other cause before the mite will attack them. If strong bulbs are planted to commence with they should be left undisturbed until the new bulbs they produce attain their full flowering size, when division should again commence. If left any longer they become crowded. This is all that is needed for home decoration, but when the bulbs are grown for the market slightly different treatment must be followed. If the four or five, as the case may be, that spring from the original bulb are left until full size has been attained they will be flat on one side. To obviate this they should be lifted one year earlier, and planted singly: the bulbs have then every chance of developing in all directions, and being symmetrical when lifted.

All the early flowering varieties should be lifted at once, and even late flowering varieties of the Poeticus section, if they are in a crowded state. Those that have been grown singly are not quite ready in the northern parts of the country. The recent heavy rains, after the long spell of dry weather, will soon start roots again into activity. Narcissi do not remain in the ground long in a practically dormant state after the foliage has thoroughly died away. After the roots have started lifting cannot be done without injury to some extent, however quickly or carefully they may be returned to the ground. It is a very great error in management to leave them in the ground until fresh roots have commenced forming. When lifted they should be spread out in the sun to dry, and if thoroughly at rest they will be ready for sorting and cleaning at the end of a week or ten days. Some strongly object to drying these bulbs, and I was told the other day by one person that he would not purchase bulbs of *N. Horsefieldi* unless they were in a growing condition—that is, had started after resting into fresh growth. This is an erroneous idea. Drying the bulbs does not injure them in the least, or those that are kept out of the ground from July to October would be injured past recovery. I believe that the bulbs of Narcissi will bear being kept out of the ground for a greater length of time than the majority of bulbous plants without serious injury. I do not, however, advocate keeping them out of the ground longer than is really necessary, because it is unnatural. If Nature intended that they should enjoy a lengthened period of rest, root activity would not commence when left in the ground so quickly after the old foliage withers. When the bulbs are needed for garden decoration and the flowers for cutting, cleaning and drying the bulbs need not be practised. We have lifted and returned them direct to the ground with the very best results; in fact, we have observed no difference between this method and that of drying them for a short time.

Whatever object the cultivator may have in view the bulbs should be sorted into at least three sizes—that is, freely developed bulbs, those that require another year's growth, and the small ones. Planting the first two sizes may vary according to circumstances; they may be planted singly in beds and borders, or four or five grouped together, the bulbs being a few inches apart. But the small ones should be planted in beds and treated as if they were being grown for sale. For this purpose the first size would be disposed of, the second planted and lifted next July, and so on. The ground selected should be such that has been well cultivated, deeply dug, and heavily manured for a previous crop. Narcissi do splendidly on ground that has grown good Lettuces, early Potatoes, and such crops. If the ground is poor it must be well enriched with manure, but by no means place it in direct contact with the bulbs. A little may be scattered along each row as planting proceeds, or it may be spread on the surface and dug in. I prefer to give a little only at planting time on light soil, scattering in addition what amounts to a good manuring on the surface early in the year, to be washed down to the roots in a natural manner. If the ground has been previously well manured, and the bulbs are only to be grown on it for one year, no manure need be given. The bulbs should be planted in rows 1 foot apart, 3 inches asunder in the row, and about 2 inches below the surface. This allows of the ground being kept free from weeds by a free use of the hoe during the growing season. All small growing *Narcissus* may be planted less than half that distance apart, but nothing is gained by crowding the rows closely together, so that weeding is rendered difficult. The small bulbs are ready for lifting again when they attain full size, which may be two, three, or four years, according to their size at planting time and the variety.

Such fine varieties as Sir Watkin, Emperor, Empress, Horsefieldi, and others are amongst the most beautiful bulbous plants that can be grown for conservatory decoration in spring. No doubt in the near future they will be utilised for this purpose much more largely than in the past. The flowers are charming in beds and

borders outside, but they are richer and more delicate when grown under glass. Even the old common double Daffodil forces well, and in appearance is more striking under glass than outside. In the neighbourhood of towns, when the flowers of such choice varieties as *Horsefieldi* are needed for cutting, the bulbs should be planted so that they can be covered with a frame. This protection is only needed during the last two or three weeks of development. Very frequently the outer portion of the perianth is destroyed after rain by being spotted with soot. This will take place long before the flowers open. However clean the inside portion of the flower may be, its appearance is marred if the outer portion is but slightly damaged. When these kinds are grown in pots the potting of the bulbs should not be delayed until October. To attain the best results they should be given abundance of time to make roots, and come forward gently in all stages of growth. The sooner they are potted after they are lifted and dried the better. They can, it is true, be lifted from the open border in October, and potted for flowering in spring, but the flowers are smaller, and the bulbs suffer materially by such rough and ready methods of culture. If the well-being of the bulbs for future use is considered, and large well-developed flowers are appreciated, potting should be done early, placing four or five bulbs in 5 and 6-inch pots. The pots should be buried beneath at least 4 inches of ashes, in some position where the sun does not strike with force. The soil in the pots will then remain sufficiently moist to stimulate growth and root activity without recourse to watering before it is necessary to remove the bulbs from the plunging material.

To do these bulbs well for flowering in pots they should be grown well until they approach a large flowering size. After they have flowered, the bulbs with the soil attached should be laid into the ground outside until they ripen, then being planted in beds for yielding stock.—NORTHERNER.

NOTES FROM A HERTS GARDEN.

ROSES ON THEIR OWN ROOTS.

OUR soil is strong, a tenacious loam over clay. It ought to be a Briar soil, and is if the free growth and floriferous character of wildlings be taken as conclusive; yet Roses do not thrive well on the Briar, especially standards, which sicken and die, except some of the free-growing kinds of Hybrid Perpetuals, and that most popular of Teas *Gloire de Dijon*, which is equally if not more vigorous and free blooming on its own roots than on the Briar. We have some trees of this Rose on the Briar with stems about 2½ feet high and 10 inches in circumference, covering a large extent of trellis, and annually loaded at one time with hundreds of fine blooms. For general purposes I prefer Roses on their own roots. They grow more freely than on any kind of stock when once they become established, and they bloom very freely. The peculiarity of Roses on their own roots is that of their pushing strong shoots from the base of the older growths, and even from the root stem, so that there is no difficulty in keeping up a succession of young vigorous growths and a corresponding profusion of fine blooms, for it is easy to cut away weakly and attenuated growths and train others in their place. Not the least of the advantages of Roses on their own roots is that of their withstanding the vicissitudes of our climate and the rigours of winter better than similar varieties on alien stocks, for, no matter what may happen, it is certain that there is a reciprocity of action between the roots and the head, and no matter how adverse the winter the growths are not injured below the snow line or the surface of the mulch, consequently Roses on their own roots survive cold that is fatal to the same kinds worked on Briar, Manetti, or other stocks.

The cuttings are inserted in sandy soil in frames, which are ordinary or two-light ones, according to the number of cuttings to be inserted. We prefer to stand the frames on a hard bottom, such as a 6-inch thickness of rough ashes, with a surface of finer ones, the rough, such as clinkers, being put at the bottom, and the siftings at the top. The site is somewhat sheltered from winds, otherwise open, and the frames are placed so that they face the north. A compost of good fibrous loam, with a fourth of leaf soil or old manure, and a sixth of sharp sand, the whole well incorporated, is put in to a depth of about 6 inches at the back and 4 inches in front, surfacing with a full half-inch of sand. The compost is put in rather firmly and in a moderately moist con-

dition, a good watering being given before inserting the cuttings, and time allowed for its soaking through.

From the Roses going out of bloom until the early part of September is our time of inserting the cuttings. We, however, prefer the early part of August as suiting all classes of Roses; the danger is having the wood under rather than over-ripe. It is an axiom that when the blooms are cast the wood is sufficiently ripened for insertion as cuttings. Such, however, is not our experience, as the season has something to do with the solidification of the wood, and we have never found soft growths to root satisfactorily, or if they should root make healthy durable plants; in fact, we like the wood hard, but not leafless as it is in autumn. We take the medium strong short-jointed growths of the current year, having all ready for inserting them beforehand, as they suffer by being allowed to lie about. The cuttings are from 6 to 8 inches in length, a little less for the weakly growers, and a little more for the stronger varieties, as the cuttings cannot always be had of a particular length. They are taken off close to where they originate, which means securing firm wood with dormant basal buds, or if this will interfere with the plant by depriving it of the necessary buds for future growth, the cutting is detached so as to leave a couple or so of the basal buds intact on the plant. The base of the cutting is pared or cut smooth transversely immediately below a joint or bud, and the leaves for two-thirds the length of the cutting upward removed, leaving those at the top intact. The shoot will probably have made a second growth from the upper part of the shoot. If those are on the part that must be retained to give the necessary length for the cutting, cut them back carefully to one joint, preserving the leaf. We thus have nothing but firm wood, every bud of which has stored matter in the wood calculated to support it until rootlets are formed.

The cuttings are assorted into sizes; the longest are put at the back of the frames, and the shortest in front. The cuttings are inserted two-thirds their length in the soil with a dibber, in rows 6 inches apart, and 3 inches asunder in the rows. We sometimes run dry crystal sand into holes before closing the soil well about the cuttings, pressing it down with the fingers. There is a decided advantage in using the sand, for when the soil comes in contact with the stem there is occasional spotting, and sometimes complete collapse, through, we presume, the organic substances in the soil undergoing change or evolving matter inimical to the as yet susceptible bark. However that may be, it is important that the soil be made firm about the cuttings. A good watering is given after inserting the cuttings; not a soaking to make the soil sodden, but a careful watering through a rather fine-rose watering-pot. The lights are put on at once, and kept on from that day forward for the next six weeks. The lights are brushed over outside somewhat lightly with whitening mixed with skim or buttermilk, or "summer cloud;" the object is to get a subdued light without dense gloom. The rains reduce the shading after a time, or, if not in three weeks to a month, we wash some of it off, and clean it off altogether by six weeks from the time of insertion. The lights are lifted every morning to see how matters are going inside, and to allow the pent-up moisture or confined air to escape. The cuttings are cleared of damped, damaged, ripened, or fallen leaves, and if there be any appearance of dryness a light sprinkling over the foliage, given through a fine-rose watering-pot, and the lights are immediately replaced. Extremes either way—i.e., needless sprinklings or withholding moisture altogether, are to be avoided.

In a month a callus will be formed, but to make sure allow six weeks; air should then be admitted so as to gradually inure the cuttings to the external air and a drier régime, as there is now to be a solidification of the growth, to effect which evaporation must take place. The plants must have exposure to light and air, and upon this depends their hardiness. Cuttings that are inserted in September—and we advise it to be done by or before the middle of the month—are treated similarly, but the necessity for shade is not so pronounced, or for sprinkling, and we make a difference in the after treatment, for whereas the early August cuttings are or may be potted up in October or not later than early November, the early September cuttings are allowed to remain twelve months before they are disturbed, and I am persuaded that thus allowing the cuttings to form good roots before being lifted is the proper way to get Roses well established on their own roots. I have tried potting them in early autumn and deferring it until the early autumn of the year following the insertion of the cuttings, and the latter were much stronger and did better afterwards than those potted and coddled through the winter. If potted they are either kept in a house from which frost is excluded or plunged in ashes over the rims if frost has access, with the protection of mats over the lights in severe weather. They can be turned out in spring or grown in pots, assigning them a position on a north border up to September, when they may be placed in a sunny one

in order to harden the wood. Good plants may be had in this way in 6-inch pots fit for forcing the winter following, or in eighteen months after inserting the cuttings. Tea-scented Roses are of course here meant. The Hybrid Perpetuals, instead of being potted, can be planted out where they are to remain in the autumn twelve months after insertion. If the cuttings are left a year the lights are drawn down in spring so as to harden the plants well, and in late April or early May, or even earlier if the frames are wanted, the latter are removed altogether, the sides of the cutting bed being sloped off with fine ashes.

By allowing the young plants to remain twelve months where inserted they get more stamina, form a stronger root stem, and fuller and more ligneous roots, with a stronger growth of head. These may be planted or potted and the roots shortened back, but not the head, letting them remain until late spring before pruning, when they may have pushed fresh growth from the upper part of the shoots, and may be headed down, leaving three or four eyes, from which speedily spring strong shoots, followed very often before the summer is over by very much stronger ones from eyes or buds below ground. When these come we may make sure of bushes in the third year that will give trusses of bloom never seen on Roses or any kind of stock, the bushes as large as any lover of basketfuls of Roses for decorative purposes can desire. If pyramids are wanted let the root growths mount up to a height of 10 feet or more, as they will in a season, and if ripened to the tips they will give a wealth of blooms the following season from base to summit, such as to astonish those who have hitherto only seen Roses on stocks.—UTILITARIAN.

STRAWBERRIES AS ANNUALS.

If my ideas on the subject of treating Strawberries as annuals are not altogether novel they are perfectly original, and, as I hope to prove, more practical than fanciful. Few experienced cultivators now-a-days allow their Strawberry plants to remain on the ground after they have produced three crops of fruit, but the question I wish to ask is whether, in very many instances, it would not be wiser to clear them off one, if not two years earlier than they do. All will agree with me that strong one-year-old plants produce comparatively heavy and early crops of extra fine fruit, and as a rule the young plants are also the most continuous bearing. In the second year they not unfrequently yield heavier crops, and not much fault can be found with the size of the berries, but it is only under favourable circumstances that the three-year-old plantations give such good returns as first appearances would warrant the inexperienced in anticipating. In a dry season the old plants are the first to fail, while should we have a wet summer much fruit rots on the ground around those longest planted, owing to these having by far too much foliage. The fact of its not paying to keep Strawberries more than two or three seasons on the ground does not prove that they would be most profitable treated as annuals, but it is leading up to it.

In the case of plants grown on deeply trenched highly cultivated ground it is only in exceptional cases that it is necessary to depend exclusively upon one-year-old plants, and it may seem incredible to some that such exceptions are to be found. When first taking charge of a garden in Middlesex I was told by an enthusiast in Strawberry culture that it was useless to leave the plants on the ground to produce a second crop, but of this I was not fully convinced till I had experimented with a portion of a large bed. In the end I was obliged to admit that only maiden plants would yield eatable fruit, and by good culture extra fine crops were invariably obtained from these. In this instance it paid well to treat Strawberries as annuals, and in numerous other gardens it would also be found the most profitable plan to adopt a similar method of culture if those in charge could "screw up courage" enough to follow it. Doubtless where much labour and expense in manuring and trenching has been incurred on the preparation of the ground for Strawberries it would seem a most unprofitable proceeding to root them up after one good crop has been taken from them, and if there were no need for it I would not advise that it be done. Where, however, the second or third crops are disappointing, which they often are, what is the use of preserving the plants after the first season's produce has ripened, and sufficient runners have been obtained? An early cleared Strawberry bed is one of the best sites imaginable for Broccoli, the latter being planted without the ground being dug, and this crop alone would pay for any trouble previously taken in preparing the soil. I hold, however, that no more trouble need be taken in planting Strawberries than almost any other crop, and when the plants are put out, say in close succession to early Potatoes planted on ordinarily manured and roughly dug ground, there need be no compunction in cutting them up after they have had a short and merry life.

While they last Strawberries are the most popular fruit in season, and the longer the supply lasts the better owners of gardens are pleased. It behoves gardeners therefore to vary the sites of the beds as much as possible, some plants being grown on sunny borders, the principal portion in a somewhat cooler but not low position, or where frosts are apt to spoil the earliest and best blooms, and the remainder in a cool late quarter. As far as the main portion or principal plantation is concerned it may not in all cases be wise to treat these as annuals, or even to destroy them after the second crop has been taken; but I maintain that nothing but young plants should be tolerated on a warm border, and that only young plants can be depended upon to fruit well in a cool or very late position. All gardeners will agree with me that the sunny wall borders are, as a rule, much too limited in extent, and the more closely they are cropped the greater the certainty that the kitchen will be well supplied with superior vegetables. A portion of a south border might yet well be devoted to Strawberries, even if only one or two hundred plants are there located, and these will be the means of furnishing several extra early dishes of fruit, and also abundance of good early runners; indeed, it is advisable to treat a few plants as annuals, if only for the purpose of obtaining a good supply of strong runners, as it is very certain those produced by worn-out older plants are far too weakly to be profitable.

Nothing can be more simple than this border culture of Strawberries, the one principal condition being that the plants be put out early, or, say, not later than the first week in August. Our plan is to liberally manure and dig the ground during the winter, and plant it with Ashleaf Potatoes in March or early in April. A good crop of these is invariably obtained, and it is cleared off long before the Strawberries are ready to be put out in succession. According as the Potatoes are lifted the ground is cleared of rubbish, forked over, or rather levelled, and all lumps of soil broken down, and this being done the planting can be done at any time, no matter how dry the surface may be. A distance of 18 inches apart each way is sufficient for the strongest growers, the best of these being Sir J. Paxton, but 15 inches is ample for the rest, including the early and very heavy cropping Noble. In our case only these two varieties will be planted on a warm border this summer, and both are profitable. It is not very material whether the runners for planting are first rooted into small pots or into a ridge of soil and moved with a mass adhering to the roots, but it is of the greatest importance that they be in a moist state when planted, and kept so afterwards, care also being taken to well firm the soil round them, as it is not a mass of foliage, but a comparatively heavy and early crop of fruit that is needed. I consider it unwise to mulch the beds till the spring, as a heavy surface dressing of manure keeps the border too cool. If the ground is rather poor an early spring dressing of soot and guano, or some kind of special manure, ought to be given and lightly stirred in, the mulching being applied after the rain has well washed this in. We commenced gathering this season from plants on an early border about June 7th, and at the present time (July 19th) we have several hundred strong runners rooting into large and small pots. When these are well established the ground will be cleared of Strawberries, and early Broccoli at once planted. The latter will give us some serviceable heads, and coming off the ground early it may be got into condition for Potatoes again or any other early crop we may choose to put on it. Those who cannot see their way to devote any portion of an early border to Strawberries may yet try another method of securing an early crop without much trouble, and for which I take some credit for originating. Having found that Tomatoes succeed admirably on a shallow raised border, temporarily formed against the sunny walls of forcing houses, it occurred to me that Strawberries would succeed equally as well under somewhat similar treatment. In this case Strawberries must be grown as annuals, a change of soil as well as plants being absolutely necessary, or failure will result. These raised beds may of any width, or, say, from 2 feet to 4 feet wide, according to the room available, and may be formed on a hard bottom, or this may be loosened prior to disposing about 6 inches of fairly rich loamy soil over it. In this moderately strong runners, which may usually be found fit for lifting among the old rows of the best early and second early varieties, may be firmly planted 12 inches each way, or they may be arranged rather more closely in squares to admit of handlights being placed over them as they are coming into flower. In dry weather they will require any time after they are in flower to be watered frequently, and in any case a mulching of rather short manure will benefit them. The fruit ought to be propped up well clear of the ground and foliage with birch spray, and those who take this small amount of trouble will be rewarded by a capital lot of extra early Strawberries. We tried several varieties last season in these positions, and the second earlies were available in advance of Vicomtesse Hericart de Thury in the open. All the plants grown

in this way will shortly be rooted out, and after a liberal dressing of rich loamy compost has been well mixed with the old soil fresh rooted runners will be planted.—W. IGGULDEN.

DEATH OF THE REV. M. J. BERKELEY.

IT is with unfeigned regret that we announce the death of the REV. M. J. BERKELEY, M.A., F.R.S., F.L.S., Honorary Fellow of Christ's College, Cambridge, and Vicar of Sibbertoft in Northamptonshire. This distinguished man of science, after a long life of unwearying work, breathed his last at Sibbertoft Vicarage on the morning of Tuesday last, the 30th of July, at the age of eighty-six. He had been ill for four months previous to his death, and though during the last four or five days he suffered much he was conscious to the last.

Mr. Berkeley was born at Biggin House, near Oundle, on the 1st of April, 1803, and was educated first at Oundle Grammar School, and thereafter at Rugby. He entered Christ's College, Cambridge, of which he was a scholar, in 1821, and graduated in 1825 as fifth Senior Optime. Although there was no branch of vegetable physiology and pathology that escaped the searching investigation of Mr. Berkeley, it was to the study of fungology and cryptogamic botany generally that his studies were chiefly devoted. His earliest work, we believe, was "Gleanings of the British Algae," written about 1830, when he was curate of Margate, and it was about this time that he made his great discovery in the way of identifying the Vine mildew and its cure. The gardener of his friend Mr. J. Slater of Margate having observed a peculiar affection of the leaves and fruit of his Vines, consulted Mr. Berkeley on the subject, who at once saw that it was a form of mildew new to this country. His remedy was an application of flowers of sulphur, which proved efficacious in destroying the pest; and the intelligent gardener, who wrote an account of the disease and its cure in the *Kentish Gazette*, had his name immortalised by Mr. Berkeley recording the mildew as *Oidium Tuckeri*. The disease spread not only in this country but on the Continent, and the vineyards were threatened with extinction, but for the simple application of the flowers of sulphur. On one occasion an extensive vineyard proprietor of the south, when on a visit to this country, requested to be introduced to Mr. Berkeley, that he might in person thank him for the great benefits he had done to France by his discovery.

In 1833 Mr. Berkeley became vicar of Apethorpe and Woodnewton, near Kingscliffe; and at Kingscliffe he resided till his presentation to the living of Sibbertoft in 1868. In 1836 he was elected a Fellow of the Linnean Society, and in 1857 he produced his valuable textbook, the "Introduction to Cryptogamic Botany," and in 1860 his "Outlines of British Fungology." In 1879 Mr. Berkeley was elected a Fellow of the Royal Society, and for his scientific researches he was awarded the Royal gold medal of the Society. Even as late as 1886 he wrote a paper on Zanzibar fungi.

As a horticulturist Mr. Berkeley was not less distinguished than he was in the higher walks of science. His gardens, both at Kingscliffe and Sibbertoft, were his never-failing delight. For many years he held the office of Botanical Director of the Royal Horticultural Society, and was also editor of its journal; and as the highest honour they can bestow the Council elected him an honorary member.

And now this great intellect, which was ever at work, is at rest; and not only in this country, but throughout the whole scientific world, will the event be regretted, for Mr. Berkeley was one of those who endeared himself to all who knew him, and who was ever ready to perform an act of friendship whenever he had the opportunity.

This brief sketch, written hurriedly on receiving the sad news of Mr. Berkeley's death, as we were going to press, is necessarily very fragmentary and incomplete.

ORCHIDS AT BRISTOL.

THOUGH neither extreme rarity or extravagant costliness characterises as yet the increasing collection of Mr. James Crispin, a well known Bristol amateur gardener and enthusiastic lover of Orchids, yet to a true horticulturist this fact does materially lessen the pleasure of inspecting any collection of plants if clean, healthy, and of vigorous growth, which, like those under notice, give evidence of the care and attention bestowed upon them. Though with only a few years' experience in the art of Orchid growing, Mr. Crispin appears to have mastered the secret of success in their culture. Beginning with a few of the commonest varieties, and noting their peculiarities and liking for certain treatment, he has progressed rapidly, and up to the present time cool, intermediate, and East Indian houses have been found necessary to accommodate exclusively the various new purchases. These houses have been constructed

to meet the requirements of the occupants in a way that is worthy of imitation by amateurs who wish to succeed in the cultivation of these interesting plants. In the cool house, which is below the ground level, hot-water pipes of small diameter are attached to the roof, by which means, together with its sunken position, ensures an even temperature both summer and winter. In the East Indian house a portion of the pipes are laid in open brickwork water-tanks, and being fitted with necessary valves to each section, and the use of an hygrometer in each house, the humid or arid state of the atmosphere is completely under control. Here also small pipes are suspended from the roof, which effectually obviates any danger from drip that oftentimes proves so destructive to the young growths; but with Mr. Crispin this is practically unknown, as latterly neither syringe nor watering-pot has found favour with him, sufficient moisture being quickly raised when necessary by evaporation, and all watering is done more effectually by plunging the plants in a tank of tepid water as often as necessary. A few plants were flowering freely at the time of my visit, among which were *Cattleya crispera*, a grand mass of growth and flower sheaths; *Cattleya Gaskelliana*, a well flowered plant; *Lælia xanthina* and *Oncidium splendidum* were worthy of note, the latter for its large mass of healthy roots, as well as for several strong spikes of bloom; *Oncidium leucochilum*, *Aerides Larpentæ*, *A. affinis*, and *Thunia Marshalli*, all well flowered and in good condition; *Cattleya gigas* bore recent traces of floriferousness and vigour by the production of seed pods; *Dendrobiums* of various species were throwing up willow-like shoots that with duly ripening should give good returns next spring. In the cool house some good types of *Odontoglossum Alexandræ* and *O. Sanderianum* were in flower with *Masdevallia Harryana*, *Anguloa uniflora*, and several others, all presenting a fine healthy appearance, showing clearly what may be accomplished by an amateur when energy and enthusiasm are not wanting.—M. C.

MASDEVALLIAS.

The disease known as "the spot" that attacks the foliage of these plants is unquestionably due to too moist and too low a temperature. Since the plants have been grown in the warmest part of the *Odontoglossum* house instead of the coolest, and the winter temperature of that structure increased, all the foliage that has been made is perfectly free from spot. During the summer months these plants are at home in any part of the cool house, but during the winter they should not have a lower night temperature than 50°. *M. towarensis*, even in this temperature, will fail to flourish; it is never removed from the warmest end, and is wintered at the coolest end of the *Cattleya* house.

ODONTOGLOSSUM VEXILLARIUM.

This enjoys a little more warmth than the cool house proper from October until May. During the summer months it is a mistake to grow it too warm and too close. The foliage draws up weakly, and soon becomes a prey to yellow thrips. During the summer it does well at the warmest end of the cool house, where it makes stiff, sturdy growth, and flowers profusely. It flowers too freely, and if three large spikes are allowed to remain on each growth until they fade the plant suffers considerably. If plants are infested with thrips the best means of eradicating it is to sponge the leaves with tobacco water and dust tobacco powder into the axils of the leaves. The latter must be well washed out again two or three days after.

DENDROBIUM NOBILE.

Plants that have been forced into growth for a few seasons, to flower during November, have finished the lengthening out of their growths. These need attention. If retained in a warm moist house they will quickly start again into growth. Remove the plants to a cooler structure, and admit air and more light to them. They must be exposed gradually to the light to harden and ripen their pseudo-bulbs. They must not be exposed suddenly to the sun, or premature ripening will commence. When once the pseudo-bulbs assume a hard yellow appearance they will bear without injury full sunshine in a cool house.—ORCHID GROWER.

CATTLEYA FORBESII.

SOME time ago (May 23rd, page 422) "N. G." asked for information respecting the flowering of the above named *Cattleya*; therefore if the following remarks upon its treatment, which in my case have proved successful, are any help to him I shall be pleased. In the first place I find the plant requires a very decided course of treatment, because it is a free grower, and if not guarded against it is very liable to do the same as *Dendrobium Wardianum*—that is, start into growth before it has done flowering. I am of opinion this habit, if encouraged, very much weakens the plant and

is likely to be one cause, if not the principal one, of the flower sheath proving barren. I also think "N. G." does not allow his plant sufficient root space. A 5-inch pan is too small for the size plant he describes, as the shortness of the pseudo-bulbs, 5 to 7 inches, seem to indicate, when they ought to be double that length. I have several plants of this *Cattleya* on blocks and in pots, and have always had them flower as well as any others of this section.

I have generally treated the plants the same as other *Cattleyas* up to the time the flower buds begin to open, when they are taken to a cooler house till the flowering is over; afterwards they are set on one side and kept rather dry, but not so as to cause them to suffer, and have a good rest; this resting I consider an important factor in the successful culture of this plant, for it is not difficult to grow and keep in good health. When the plants are started into growth a surfacing of fresh peat and sphagnum laid up close to the base of the pseudo-bulbs will assist them much, as the young rootlets take quickly to it, and it would be wrong to allow them to get thoroughly dry while growing.—THOMAS RECORD.

CANKER IN FRUIT TREES.

TIRED as I am of writing on this subject, I cannot leave the discussion as it stands on page 38. To leave it thus would not be fair to my arguments or the subject itself. Personally I do not care the toss of a button whether "W." demolishes my theory to his own satisfaction, whatever lookers-on may say. My Goliath with the pen refers to my "capitulation" as regards insects attacking only such sorts as they like best. Writing from memory, this idea occurred at the outset some five or six years ago, and it was in reply to a question put at a meeting of the Amateur Gardeners' Society. As it has always been imagined that certain sorts of Apples—Ribston Pippin, Dumelow's Seedling, and Hawthornden for instance—are more subject to canker than others, I have purposely experimented upon them. I think any unprejudiced readers will agree that if I can keep these sorts free from canker on my insect theory, as I have before stated, while other trees of the same varieties not operated upon and growing near continue to canker, whether the winters are "comparatively mild" or not, the insect theory is not quite "demolished."

If my trees should have to succumb to frost-bite when the thermometer goes down to zero, as I have known it here, well and good, I will willingly "capitulate," but when I remember the beautiful healthy appearance of the Canadian trees after 30° below zero I have faith that the trees referred to will stand even zero without chilblains. I remember how every particle of the trees above ground (I must be careful) was enveloped in a sheet of ice for over a week last winter, although the thermometer did not go very low, perhaps not low enough to produce canker in all alike.

"W." refers to the insects he has seen both on the Impney specimens and on mine. Now of course I cannot say which species of insect he referred to, because there are at least half a dozen that I am well aware are found in cankered places and decaying wood. A very interesting item respecting the different insects found has just come under my observation. When cutting some specimens for examination I noticed a large red spider start from a place which was fast recovering from a canker wound (No. 1 case enclosed, which is carefully sealed up). On removing a bit of the dead bark with my thumb nail two or three insects of a grey colour were disturbed, which are usually found on dead wood. One of these the spider immediately seized and demolished. Although shaken off it was not going to be deprived of its dinner. It carried its prey like a cat would a rat, and you can see the specimen. Above that wound on the same branch the wood is killed with canker. Specimen No. 2. Close examination will reveal the tiny insects I have so often referred to. Whether these are what "W." refers to or not, these I am convinced are the originators of canker, and let the specimens come from where they may, England, Ireland, or the Channel Islands, I have never failed to find them. Specimen No. 3, which is killed with canker at a certain point where the insects and larvæ are in abundance under the dead bark. These for some unaccountable reason we are asked to believe are the results and not the cause of canker. If I carefully get rid of these, and the trees become healthy and free from canker, I must not believe they were the cause, but that frost or half a dozen other reasons were at the bottom of the mischief. I have not the slightest objection to sending carefully selected specimens containing these insects to the Scientific Committee of the Royal Horticultural Society, but considering that I have before seen what a scientific gentleman has had to say upon the subject I should expect a repetition of the reason given of canker. If I did not cure the Hawthornden tree before referred to I have cured another of the same variety on precisely the same kind of stock by "painting alone," and some of the fruit from the same tree was sent to the *Journal of Horticulture* some three years ago, with a specimen of Jargonelle Pear on a branch nearly cankered through, and after dressing it bore well, although there was not above an eighth of an inch of bark to supply the sap.

"W." makes me to say that, with reference to Dr. Hogg's tree not affected, it should be according to my insect theory. This I do not admit. These insects do not fly, and if they are well satisfied on the other trees there is no need for travelling.—J. HAM.

[The specimens sent have been subjected to microscopic examina-

tion, and it was apparent the insects had escaped in transit. We endeavoured long and anxiously to find the alleged canker-causing culprit, but failed.]

LONICERA SEMPERVIRENS.

FOR training up the rafters of a cool greenhouse few plants are better suited than this lovely North American Honeysuckle (*Lonicera sempervirens*), fig. 10; its trailing habit is admirably suited for this purpose. The terminal clusters of trumpet-shaped flowers, which are produced during spring and early summer, hang down in great profusion, are very showy, being a brilliant orange-scarlet with yellow inside the

FIG. 10.—LONICERA SEMPERVIRENS.

flowers, and contrast well with the green glaucous leaves. If planted out of doors in a sunny situation it flowers freely during summer, but, unlike most of our hardy Honeysuckles, it has no scent. There is another variety of this delightful species called *L. sempervirens minor*, also useful for a similar purpose.—G.

FRUIT AND VEGETABLE CROPS IN HAMPSHIRE.

ALTHOUGH Apples and Pears flowered abundantly with few exceptions but little fruit can be recorded. Worcester Pearmain never before failed to produce a good crop of fruit, but this season it is nearly fruitless. There are a few varieties of Apples which carry nearly a full crop, but some regarded as "certain bearers," have not a quarter of a crop, while others, notably of Keswick Codlin, Alfriston, Dumelow's Seedling, and Mère de Ménage, have no fruit. Those which have a thin sprinkling are Lord Suffield, New Hawthornden, Devonshire Quarrenden, Cox's Orange

Pippin, and King of Pippins. The few which have a full crop are Warner's King, Yorkshire Greening, Ribston Pippin, and Irish Peach; the latter, owing to its earliness, escaped the attacks of caterpillars. The ravages of this pest is the main cause of the loss of the Apple crop.

Pears are even worse than Apples in respect to fruit. All varieties as pyramids, including even Louise Bonne de Jersey, are a failure, while of wall trees only such as Beurré Diel and Pitmaston Duchess carry anything like a crop. The trees look very healthy, the foliage being good and clean. Damsons bloomed most profusely, but the trees were early attacked with green fly; the result is only a thin crop of fruit. Cherries on walls, such as May Duke, White Heart, Governor Wood, Bigarreaux, and Morellos have a good crop, while the trees look healthy, except Morellos, which in some instances have lost the points of the young shoots, these having died off quite suddenly. Plums on walls flowered abundantly, but have only a moderate crop of fruit, as green fly seized the trees early. Some few varieties are good, such as Orleans and Cox's Golden Drop, while Green Gage, Washington and Jefferson, have a medium crop. Victoria is this season devoid of fruit; plenty set, but failed to swell.

Bush fruits promise an unusually heavy crop. Gooseberries are more abundant than usual; and the crops are always heavy here. Black, Red, and White Currants have a heavy crop, but many berries of the former and latter kinds have fallen from the points of the bunches, while the red ones are quite perfect. Strawberries have been very abundant.

Potatoes look remarkably well in this neighbourhood, and so do the majority of vegetable crops with the exception of Carrots and spring-sown Onions. The former are nearly a failure owing to the ravages of slugs, which played sad havoc with many crops. The usual remedy of dusting the plants was utterly useless, in fact they seemed to thrive and grow fat upon soot; lime used in a quick state is by far the more efficacious. Carrots have been sown two and three times in some parts, and still there remains but half a crop. Onions did not come up so well as in years past, and full crops could only be had in some gardens by transplanting.

I never saw trees, both deciduous and evergreen, grown at such a pace nor in such luxuriance as they have done this year; especially is this noticeable in Conifers. Limes, like fruit trees, have been devoured by caterpillars.—E. MOLYNEUX.

INSECTS OF THE FLOWER GARDEN.

(Continued from page 405, last vol.)

BEFORE describing some other insects of the Lepidopterous order which, in their caterpillar state, are more or less hurtful to the plants that adorn our borders and beds, I must refer to the benefits derived from certain butterflies and moths which help on the fertilisation of flowers in their researches after honey. The insects give assistance not only in those cases where the stamens and pistils are in separate flowers, but also in many other cases where, although these are located together, there are obstacles which interfere with self-fertilisation. It is, of course, unavoidable that the insects by their visits and journeys from flower to flower should produce changes similar to those the gardener makes by design; and in their transference of pollen these creatures sometimes alter the character of a favourite flower, and we get a new strain which is not regarded as an improvement. This is unavoidable, but, on the other hand, some capital varieties are due to crossing effected by insects. Brightly coloured and showy flowers are, as a rule, visited by butterflies and day-flying moths rather than those that are small or inconspicuous.

Now, in the order of the Cruciferae or Crossworts, which contains many familiar garden species, as for example the Arabis and the Wallflower, though the species are much frequented by the above and by other insects, their part in fertilisation is not important owing to the structure of the flowers. But it is different when we take some species of the Caryophyllaceous tribe, such as the extensive group of Pinks. Here we have a flower with a long tube, and it is impossible for a bee or fly to reach the honey; but a butterfly can, as its proboscis is adapted to a tube of the kind, and when it is withdrawn a portion of the pollen is generally carried away by the insect, to be rubbed off usually on the next flower visited, for it has been noticed that most insects visit when they can a succession of flowers of the same species. A flower with a long or curved corolla is likely therefore, if fertilised by insect aid, to be indebted to a moth or butterfly, but their diligence in this work is evidently less marked than that of the bees and their allies.

There is a group of moths containing numerous species—a few large, but the majority of moderate size—in which are some of frequent occurrence in flower gardens. We style them the Geometers—i.e., “ground measurers,” from a peculiarity of their caterpillars, which are also called loopers, because in the act of walking they loop the middle of the body, having legs only at the head and the tail, and, as a matter of course, they appear to measure the ground, or a branch upon which they may be walking, doing it in strides, few or many as may happen. Another odd circumstance with some of them

is that they raise the upper part of the body in the air at various angles when they are reposing, and then appear like little bits of twig. Undoubtedly one result of this mimicry is that they frequently escape being eaten by birds, but it does not save them from their parasitic insect enemies, which are guided to their prey by some keen sense, smell or touch, rather than sight probably. Just about this time there may be seen in gardens, flying languidly at eventide, and conspicuous from its pale hue, the moth called the Swallow-tail (*Uropteryx sambucata*), which by its English name indicates the peculiar formation of the wings. The Latin name is not so appropriate, for though the caterpillar does occur upon the Elder, this is not its only or its chief food. I have taken it upon fruit trees now and then. The Honeysuckle is one of its favourite plants, and a variety of herbaceous species. Newman remarks that he found it very partial to garden Forget-me-nots. This is a somewhat large caterpillar, yellowish brown or darker, with pale stripes, and seven humps. It begins to feed in the autumn, then lays up for the winter, and completes its growth in spring or early summer. Its cocoon is curious, being rather in the form of a hammock, which is slung from a twig by silken cords; its texture is slight, but bits of leaves are interwoven.

There is a moth not uncommon in April and May, seldom seen in flight, but which rests on palings during the day, its wings streaked and lined with grey, brown, and black often resembling in colour the weather-stained or moss-grown wood to which it clings. This we designate the waved umber (*Hemerophila abruptaria*). It is not abundant enough to cause serious mischief as a caterpillar, but in that stage it feeds upon the Lilac, and the Rose generally in July. This is a slim brown caterpillar bearing behind its head a white ring like a collar, and when full grown it spins a cocoon at the foot of some twig. Chiefly in the south of England we find feeding on varieties of the Clematis the greenish-white caterpillar of the small emerald moth (*Jodis vernaria*). This lovely insect cannot, however, be kept in collections without its fading by degrees. The moth emerges about July, and the caterpillar feeds in autumn. Next we pass to some moths much smaller, but also geometers, belonging to the group of the pugs, insects difficult to name, as allied species are wonderfully alike in many cases. They are commonly to be seen about gardens through the summer sitting on some object with the four wings expanded and flattened. Nearly all the caterpillars, which are small, like the moths, live concealed in the flowers of herbaceous plants, and as a result these are more or less disfigured, while the development of fruits and seeds is prevented. Happily, few of the Eupitheciae or pugs are numerous enough to interfere seriously with the floral display in our gardens, as there seems to be no remedy except that of removing all buds or flowers seen to be infested. A few of them make cocoons in the seed pods, but most of them descend to the soil and make a little cell of silk mixed with fragments of earth.

The caterpillar of the netted pug (*E. venosata*) feeds in July upon the capsules of the species of *Lychnis*; it is greyish, has a black head, and is spotted with white. One of the commonest of the pugs occurs from May to August, both as caterpillar and moth. It is somewhat absurdly called the lime speck, for it has nothing to do with the Lime tree; the Latin name (*E. centaureata*) brings us nearer to the truth, for if it does not feed upon the Centaury it infests a variety of plants belonging to Composite tribe, such as the garden Scabious and the Golden Rod; it is also occasionally found on Campanulas. This caterpillar is slender, usually yellowish or pale green, with darker spots, which are sometimes wanting; specimens also occur which are pinkish white and spotted with red. A pug named after the illustrious naturalist, Haworth, is very fond of the buds of the Clematis, going from bud to bud, and doing conspicuous damage, as the caterpillar consumes a number of these in July and August, each turning black when it is quitted by the insect. There is little chance of catching the moth, for it flies very rapidly and always in broad daylight. Very abundant some years is the pug called *E. Absynthiata*, but it by no means confines itself to Wormwood, for the caterpillar feeds upon a great variety of plants, though it may show a preference for those of the Umbelliferous order. It attacks the flowers and also the fruit, feeding from August to the end of October, and specimens, even of the same brood, are of all shades of colour, but invariably studded with short white hairs.

Amongst the moths known as the “carpets” are several species that haunt the flower garden; one of these, which is occasional only, is the silver ground carpet (*Melanippe montanata*) a pretty insect of creamy white, marked with grey and brown. Towards the end of the summer it deposits eggs upon the leaves of the Primrose, probably, also, when it has opportunity on allied plants in our gardens. The caterpillars live from autumn to spring. These are brown, and have curious stripes and markings of deeper brown,

— **GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—Mr. E. R. Cutler writes:—"As you are well aware, the Committee of this Institution desired to commemorate the Jubilee year of this Institution by placing on the pension list all the unsuccessful candidates at the late election, and so clearing up the list. I have the pleasure to inform you that at a meeting of the Committee held yesterday it was decided to carry out the scheme, and they have placed the whole lot, seventeen in number, on the pension list from the 24th June last. It may perhaps interest you to know that the pensions are paid every quarter, and the first payment will be made on or about the 1st of October. I enclose a list of the persons placed on the list, and please note the great ages of many of the pensioners, and that they reside all over the country, only three in London:—James Brown, Croydon, aged 71; Edward Spivey, Sawbridgeworth, 76; George Lambert, Chichester, 71; Stephen Evans, Chichester, 74; Thomas Morley, Cambridge, 80; Joseph Norval, Chester, 63; Elizabeth Snow, Taunton, 74; James Manderson, Stoke Newington, 66; Elizabeth Pollard, Croydon, 76; Henry Berry, Dromore, Ireland, 73; James Edmunds, Fulham, 83; William Fowle, Southampton, 69; George Fricker, Bourne Valley, 73; John Grimshaw, Huyton, Liverpool, 80; John Hooper, Bristol, 80; Clement Preston, Brixton, 77; James Priest, Long Eaton, Notts, 65.

— **BUNYARD'S PRIZETAKER LONGPOD BEAN.**—Some pods of this variety have arrived from Maidstone. We have seen longer, but never better filled pods than these, which contain eight beans each. They are perhaps the heaviest pods we have had sent this season, and that is a good test of productiveness.

— **LAXTON'S JUBILEE STRAWBERRY.**—We find this variety to be the heaviest cropper of any we have (fifty varieties), and when fully ripe it is of delicious flavour. Its great merit is that it lasts such a long time, and perfects all its fruit. Where large berries are required it will be necessary to thin severely.—GEO. BUNYARD & Co.

— A CORRESPONDENT sends the following:—"In the saloon of the Royal train which conveyed the Queen to London on Friday, from Portsmouth Harbour, for the purpose of attending the marriage of the Princess Louise of Wales, had been placed a tastefully arranged BASKET OF FLOWERS, comprising Orchids, Roses, Carnations, white Passion Flowers. Her Majesty so greatly admired the basket that by her express instructions it was removed to Buckingham Palace. Mr. H. Appleby, of the Boxhill Nurseries, Dorking, supplied the flowers, the arrangement being left to Mrs. Appleby."

— **ALOCASIA MACRORHIZA VARIEGATA.**—For decoration during the summer months in either a large or small state this Alocasia is much admired. That there are good and bad types of it there can be no doubt. It is from those in which the markings are clearly defined that the offsets should be secured. If these are slipped off with a small portion of root attached, and placed in 2½-inch pots, using mainly peat and sand with some decayed leaves, they will quickly grow into vigorous plants, especially if they can have the benefit of a close case in the propagating house for a week or two. Afterwards a position close to the glass in the stove is suitable. They should be shaded from bright sun in the middle of the day. Plants in 4 and 5-inch pots are useful for decoration in a variety of ways.—A.

— **LYCHNIS VIScaria FL. PL.**—On the rockery and in the herbaceous borders this Lychnis is one of the most showy of plants, the colour being a bright magenta. It is of dwarf growth, and the flower spikes do not require any support. When used for the rock garden this Lychnis should be planted in a mass, and not dotted singly here and there. The foliage is narrow, forming compact tufts, which is all in its favour as a rockery plant. Where the stock is limited the best method of increasing it is to take up a few old roots at the end of September, pulling them into pieces, no matter how small, if a piece of root can be secured to each, inserting them in sandy soil in a cold frame, shading from bright sun for a few days, and excluding air for a short time until new roots have formed, when abundance of it should be given. If the plants are allowed to remain in the frames until the following April they will be good to transfer where required, and will flower freely in June.—H.

— **PERENNIAL MIGNONETTE.**—There is growing on an old stone wall near us a root of Mignonette, about 10 feet from the ground, with between sixty and seventy spikes of bloom upon it. It has stood there in a south-westerly aspect for the last two winters, and notwithstanding

the severe frosts we have experienced the blooms are as fresh and as sweet as ever. Is not this unusual considering all the others on the ground were killed in the autumn?—H. H. [It is unusual to find Mignonette thus established and flowering so freely now after having remained for two winters in the wall, but it would be still more unusual if the plants in the ground continued in the same way. We had a plant for years in an old wall, but it did not flower so early as yours. The Mignonette is naturally a perennial plant, and when grown in a dry place, which induces the formation of woody stems, these remain alive through the winter and put forth fresh growths in spring. Grown in rich soil in the open border the stems are succulent and destroyed by frost. A plant of Mignonette may be kept in a pot for a number of years.]

— **THAMES DITTON HORTICULTURAL SOCIETY'S SHOW.**—This, the second Exhibition, was held on July 24th, and was in every respect a marked advance on that of last year. Groups of plants arranged for effect were quite a feature of the Show, six exhibitors competing in this class. First honours were accorded to Mr. Card, gardener to — Rueker, Esq., for a very tasteful arrangement, a little crowded perhaps. It was very closely followed by Mr. W. Palmer, gardener to W. F. Hume Dick, Esq., for an exceedingly light and pleasing group. Other competitors who showed well in this class being Mr. Simmonds, gardener to G. B. Windeler, Esq.; Mr. Tarr, gardener to Hannibal Speer, Esq., and Mr. Kent, Thames Ditton. Fruit and vegetables were well and extensively shown, the latter from the cottagers making a good and interesting display. Prizes are offered by the Society for the best kept allotments, this doubtless conducing to increased cultivation on the part of the cottagers. The Royal Horticultural Society offered a Banksian medal to the exhibitor gaining the greatest number of prizes, and this was won by Mr. W. Palmer. Messrs. Puttick & Shepherd, successors to T. Jackson & Son, Kingston, arranged a tasteful group of foliage and flowering plants not for competition, and Mr. W. Tayler, Hampton, contributed some good cut Roses.

— A BOX OF VIOLAS, recently received from Messrs. Collins and Gabriel, recalls the great usefulness of the superior forms of these bright and cheerful flowers. Blooms of about twenty varieties were received, with a brief note of each:—Champion, a fine telling white, very large, makes a handsome bed; Ardwell Gem, the best of the light yellows, very free; Forerunner, a capital bedder in all respects; Lord Darnley, rich and telling in colour, an excellent summer bedder; Mrs. Chas. Turner, a most charming early variety, purple violet, fine form; Sir Joseph Terry, blackish maroon, dwarf, free, and quite unique; Dawn of Day, milk white, splashed and barred with violet blue, distinct; Lady Diana, very free flowering and compact, purple crimson; Queen of Violets, dwarf and sturdy, producing abundance of crimson-purple flowers of fine form and substance, distinct, violet shading in centre, a first-class variety; Pilgrimage, excellent bedder, free, and very effective; Bullion, the best golden Viola, very profuse; Elegance, lilac mauve, distinct; Spotted Gem, makes a lovely bed, very free; Crimson Gem, A1 for bedding purposes, dwarf, compact, free, excellent constitution; Archie Grant, rich violet purple, very fine; Jeffreyana, a most compact pure white form, good bedder; Countess of Hopetown, the grandest of all the pure white selfs; Duchess of Albany, an exquisite combination of steel blue and deep violet mauve; Ethel Baxter, a very fine bedder; and True Blue, dwarf, compact, and an abundant bloomer.

— **WOOLLY SCALE ON FRUIT TREES.**—Miss Eleanor A. Ormerod writes:—"I should much like to be allowed to draw the attention of your readers who may be interested in fruit growing to the appearance or spread of a large white woolly Currant scale which is to be found on Black Currant bushes, also on the Red and White kinds, and on the Flowering Currant (*Ribes sanguineum*.) I have also information of its being found on the Mountain Ash—the Rowan tree of North Britain—*Pyrus aucuparia* scientifically. This locality is of very practical interest, for if it should be found to attack other trees of the *Pyrus* kind—namely, Apple and Pear trees, it will be a very serious business. This scale insect is of the same family as the well-known scale insects that infest Apple and Plum bark, and lives in the same way—that is, by drawing away the juices with its sneaker. But it is easily distinguishable, and the attack noticeable some yards off, by the female scale having an egg-bag of white, woolly secretion. It thus appears, when fresh, like a little mass of slightly corrugated white material, about a quarter of an inch across, and partly hidden at one end by the brown coat of the dead female scale. After a time, when the egg-bags are torn and dispersed, the wool coats the twigs, so as much to resemble the

well-known American blight, and by this appearance, or the many white dabs (perhaps as many as sixty on a foot length of twigs), the attack may easily be distinguished. Just now the young scales are coming out in legions from the woolly bags, and give them the appearance of being dusted with cayenne pepper. This insect has been identified by Mr. J. W. Douglas, a leading authority on this family of insects, as *Pulvinaria ribesiae* of Signoret, a kind known in Germany and France, but which had not before been identified as British. It is of so much importance to check an attack of this kind in its first spread that I would strongly advise all who find it in their gardens to cut down and burn the Currant bushes where they stand, to avoid the risk of the enormous quantity of young insects spreading to other bushes. A limewash, of which I expect shortly to be favoured with recipe in full, has been found serviceable for extirpating the pest in autumn; but its destruction at once would be eminently desirable. Any information regarding this insect would be gratefully received."

— At the last meeting of the ROYAL METEOROLOGICAL SOCIETY for the present session Mr. W. Marriott gave a very graphic and interesting account of the recent thunderstorms which have prevailed over this country. On Sunday, June 2nd, a thunderstorm passed across the country in a northerly direction from Wiltshire about 3 A.M., and reaching Edinburgh by 10.44. It travelled at the rate of about fifty miles an hour. It is possible that this storm travelled still further north, and reached Kirkwall at 3.37 P.M. A severe thunderstorm prevailed over the neighbourhood of the Tweed between 11 A.M. and noon, and was accompanied by hail of very large size, some of the stones being 5 inches in circumference. A very destructive storm occurred over the whole of the north-west of England and south of Scotland during the afternoon; much damage was caused by lightning, and very large hail fell over an extensive area. Some of the hailstones measured 7 inches in circumference, and weighed 7 ozs. During the night of the same day a severe thunderstorm prevailed over Norfolk, which was also accompanied by very large hailstones, some of which were 5 to 6 inches in circumference. On Thursday the 6th thunderstorms prevailed during the afternoon over the whole of the south-east of England; that which prevailed over the Metropolis about nine o'clock was remarkable for the brilliant and continuous display of lightning. During the same night and in the early morning of the following day a very destructive storm prevailed over the eastern counties, much damage being done by the lightning in the north-west of Norfolk. Severe hailstorms occurred between 2 and 3 A.M. both at Margate and Ipswich. During the afternoon of the 7th destructive thunderstorms prevailed over the whole of the southern counties, much damage being done by lightning; while at Tunbridge Wells there was a most remarkable hailstorm; one of the hailstones which was weighed was actually half a pound in weight. An interesting collection of over forty photographs of lightning taken during the storm on June 6th was also exhibited to the meeting. In addition to the sinuous, ribbon, and meandering flashes of lightning, several photographs showed knotted, multiple, and dark flashes. The following papers were also read:—"The Climate of British North Borneo," by Mr. R. H. Scott, M.A., F.R.S.; "On the Variation of the Temperature of the Air in England during the period 1849 to 1888," by Mr. W. Ellis, F.R.A.S., F.R.Met.Soc.; "Atlantic Weather and Rapid Steamship Navigation," by Mr. C. Harding, F.R.Met.Soc.; "Meteorological Phenomena Observed during 1875-87 in the neighbourhood of Chelmsford," by Mr. Henry Corder; "Rainfall in China, and Meteorological Observations made at Ichang and South Cape in 1858," by Dr. W. Doberck, F.R.Met. Soc.

LILIUM BOLANDERI.

A SMALL flowered but very distinct Lily bearing the above name was shown a short time since by Mr. T. S. Ware, of Tottenham, at a meeting of the Royal Horticultural Society's Floral Committee, when it attracted some attention, as few had seen it before. We understand it is one of Mr. Ware's recent acquisitions, and is rather scarce, as it is not included in the collection at Kew. At first sight the flowers would hardly be taken to be those of a *Lilium*, and they are perhaps more suggestive of some of the *Fritillarias*. According to the description by Sereno Watson in the proceedings of the American Academy of Arts and Sciences, the plant in a wild state has stems 1 to 3 feet high, each having one or two flowers, the leaves verticillate and slightly glaucous, and is related to both *Lilium parvum* and *L. maritimum*. The flowers have a nodding tendency, and are of a dull purplish hue or brownish red, becoming paler, and having numerous dark spots on the segments, the colouring and markings imparting a peculiar rather

than a beautiful appearance. It is said to have been found on the Red Hills, Humboldt County, California, and in Humboldt Bay. It may prove to be hardy, and such is said to be the case, but it will require a little further testing, though it is remarkable that many Lilies reputedly delicate have been found quite hardy where they were least expected to be so. There is a strong probability that more *Liliums* are killed by superfluous solicitude for their welfare than by climatal defects. The greatest evil these plants have to contend with is a water-logged soil, and unless some means are adopted to alter such a condition it is use'ess expecting to do much good in Lily culture out of doors. Provided suitable drainage is ensured there are not so many difficulties

FIG. 11.—LILIUM BOLANDERI.

in having a fairly large and representative collection in a satisfactory or even in a flourishing state, and this has been found in more than one garden.—C.

ROYAL HORTICULTURAL SOCIETY.

JULY 23RD.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters in the chair, Messrs. MacLachlan, Morris, Michael, Oliver, Veitch, Wilson, Professor Ward, Dr. Müller, and Rev. G. Henslow (Hon. Sec.).

Pinus austriaca Injured.—Dr. Masters brought boughs of this tree with the young shoots dead, sent by Dr. Hogg. The tree, he reports, was planted eighteen years ago, but for the last two years has been attacked by some malady, the affection proceeding rapidly downwards. The soil on which it grew was a strong sandy clay, but well drained. No insect could be detected upon the boughs by Mr. MacLachlan. Mr. Veitch suggested the cold wet season, and probably an injurious sub-soil, as being the causes. Prof. Ward remarked that a sudden thaw chilling the roots would produce such an effect as the tree in question showed, or an east wind catching the side of a plantation would be a sufficient cause. The fungus, *Hysterium Pini*, which produces black spots, gives rise to a similar appearance, but the specimen showed scarcely any suspicion of this disease. Prof. Ward observed that the effect of frost in April is often recognised by the bases of the leaf-shoots remaining green, in consequence of the protection afforded them by the sheathing scales.

Abies Nordmanniana.—Dr. Scott reported as follows upon the specimens exhibited at the last meeting. "It appears that the burr-like mass of branches with paler yellowish-green foliage was due to the

presence of *Æcidium elatinum*. The mycelium of this fungus was abundant in the stunted leaves and in the abnormal portions of the stem, the development of the leaves being much affected. The diseased leaves show no differentiation of palisade and spongy parenchyma; few chlorophyll granules are developed, and there is a marked deficiency of starch. This last-mentioned fact is, no doubt, a cause of the imperfect development of the wood in the infected branches." Prof. Ward, who had also examined it, added that he discovered a few spermogonia, but no "æcidium" sporanges. It is the same uredinous fungus which causes the "Witches' brooms," and is mostly, if not invariably, confined to *Abies*, for Dr. Masters remarked that he had met with it, if it be the same species, in *Pinus austriaca* and *P. sylvestris*. Dr. Ward added that the fungus has a very remarkable stimulating effect on the cambium, and alters the botanical characters of the part affected, rendering the leaves annual.

Fern-prothallus with Water Pores (?).—With reference to the accumulation of water upon the prothalli mentioned at a previous meeting Professor Ward thought it was quite conceivable that water might accumulate in the tracheids beneath the sorus; but on the other hand it might have been merely dew drops, the evidence being insufficient to furnish a more definite conclusion.

Ivy-leaved Pelargonium Diseased.—Mr. Morris showed leaves of plants received from M. Lemoine and grown at Chiswick badly diseased with a new species of *Gloeosporium*. There was no remedy known, and complete destruction by burning was the only thing to be done.

Effects of Hail at Kew.—He also showed leaves of bedding-out plants, and mentioned a long list of others injured in various degrees by the hailstones, which had riddled and lacerated them on July 15th. Aquatic plants suffered in the same way. Some of the genera most severely injured were *Funkia*, *Nicotiana*, *Polygonum*, Gourds, *Podophyllum*, *Malvaceæ*, *Saxifraga peltata*, *Rheum*, *Boraginæ*, *Solanaceæ* generally, and *Gunnera scabra*. Fortunately there was no damage to the glass houses.

Peas Diseased.—Mr. N. H. Pownall, Lenten Hall Gardens, Nottingham, forwarded specimens of Peas badly attacked by fungi. He reports that for years there have been patches of it, but this season it is very bad indeed. It was referred to Mr. Oliver for examination and report.

Plum Leaves Blighted.—Mr. J. Lloyd-Bozwan of Worcester had forwarded specimens to Kew, which Mr. Morris exhibited to the meeting. The blight had not been previously observed at Worcester. After the attack the leaves shrink up, wither and die, as if burnt, and the ends of the spring shoots, some 7 or 8 inches in length, die also. The leaves are mostly marked with discoloured patches of a faint dusky red colour. Dr. Masters said that he had received similar specimens from various districts. No fungus could be detected by Dr. Cooke, and no insect appeared to be the cause; but Mr. Veitch and other members of the Committee had little doubt but that the affection was due to the wood having been badly ripened in the previous year.

The Red Rose of Lancaster (?).—Mr. W. G. Barron had sent specimens to Kew, which Mr. Morris exhibited, and were supposed to be this variety. It appeared, however, that in the opinion of experts it was a Damask Rose, and not the true Rose of Lancaster, which produces red and white blossoms on the same stem.

Tarsonymus on Abies Nordmanniana.—Mr. Michael had examined the branch above referred to for the presence of any insects, and although having nothing to do with the cause of the alteration of structure, he found the above mentioned insect, but no phytogn. It is a leaf miner, and sometimes very destructive to trees at Turin. He also found eggs at the points of the shoots, which appeared to be those of some aphid.

Blackberry and Raspberry Cross (?).—Mr. Henslow exhibited fruiting branches of a plant originally received from Mr. Viccars Collyer, which he reported had come up quite accidentally in his garden. Mr. Henslow had cultivated it for two years. It flowered last year, the blossoms closely resembling those of a Raspberry, but it bore no fruit. In the present season it has an abundance of fruit densely clustered, quite black, each "drupel" having a tomentose base, and provided with an embryo. It agrees in appearance with the Blackberry, but has ripened at the period of the Raspberry. The stem and foliage is tomentose, agreeing with the Raspberry, but the method of formation of the quinate leaves, as described by Mr. Henslow last year, is that of the Blackberry. The taste was thought by members of the Committee to be indicative of both species. Having been referred to Kew since the meeting, the plant has been recognised as *R. occidentalis*, L., "the Black Raspberry" or "Thimbleberry" of the North U.S. Prof. Gray (Man. of Bot., p. 121), says that curious forms are known with fruit intermediate between this and *R. strigosus*, Michx., a species which "too closely resembles the European Raspberry." Hence it may be a hybrid between this last mentioned species and *R. villosus*, Ait., the "common" or "High Blackberry" of U.S.

Vegetable Marrow Malformed.—Mr. Henslow exhibited a specimen to which a branch had become adherent about half the length of the fruit. It had been cut off three or four weeks ago, and the branch had grown about 12 or 14 inches, and was producing flower buds, at the expense of the tissues of the Marrow itself. It was accepted for the museum at Kew.

Mint with Spiral Torsion.—Prof. Ward exhibited a specimen of this well-known occurrence in plants, with opposite and decussate leaves.

The leaves do not become alternate by any development of internodes but are arranged in a second manner, by a twist through a semicircle.

Mint Flowering.—Mr. Henslow observed that the common garden Mint is coming into blossom abundantly this season, and exhibited specimens in flower from Ealing. The shoot brought by Prof. Ward was also in bud. Mr. Henslow observed that at present the flowers are all female only, with rudimentary stamens—hence, like so many other Labiates, it will probably prove to be gynodioecious.

Water Culture of the Potato.—Dr. Masters remarked on some experiments he had made with Potatoes grown over water that they had produced an abundance of roots, and even some flowers, but no attempt was made to develop any new tubers.

ANDROMEDA (ZENOBIA) SPECIOSA VAR. CASSINEFOLIA.

THIS plant is a native of North Carolina in the neighbourhood of Wilmington and Fayette Town, also found in the Pine barrens along the coast as far south as Florida. It was introduced into England at

FIG. 12.—ANDROMEDA SPECIOSA CASSINEFOLIA.

the beginning of the present century by Fraser, who, at that time, had a nursery in Sloane Square.

An illustration was published by Sims in the "Botanical Magazine," plate 970, under the name of *Andromeda cassinefolia*, but expressing his belief that this and *A. pulverulenta* are but varieties of one species. This view has since been confirmed by the American botanists, notably by the late Dr. Asa Gray, who has brought both forms under the *Andromeda (Zenobia) speciosa* of Michaux in the "Flora of North America," vol. ii., part I., page 31. At Coombe Wood it attains the height of 3 to 4 feet, flowering during the end of June and beginning of July.

GRACE DARLING.

NOT the woman whose noble deed has made her name a household word in this our sea-girt isle, but the Rose—a variety that will not, I think, be soon lost sight of. But what is she? I ask, because at the Bath Rose Show of 1888 it most unfortunately fell to my lot to be obliged to disqualify a splendid stand of twenty-four Teas coming from that prince of Tea growers, Mr. Prince. It was a very painful task to my brother judge and myself, but looking at the N.R.S. catalogue I did not see what other course we could adopt. I had a long talk afterwards at the railway station with my old friend Mr. Prince himself, who, I am bound to say, took the disqualification most kindly. The stand was so much ahead of all the others that even without the Rose, judged by points, the stand must have led by many points.

I was unable to get to Bath this year, but I have asked myself several times this season, looking at the reports of shows—Did we do right? Several times I have seen in your reports of Rose shows this same Grace Darling figuring amongst the Teas, and at the Gloucester Show there is my old friend, nothing daunted, taking first for eighteen Teas, and amongst them is this same Grace Darling. Nor is it to be wondered at if in amateur collections this Rose should appear in a Tea stand, for certainly in the catalogue of one of the most successful nurserymen this year amongst the Teas I notice the same name. Again I ask, What is she? Looking at the foliage, the style of growth, and the flowers I should place her among the Hybrid Teas. I have not seen an N.R.S. list of Roses for 1889, but in 1888 she was distinctly placed in this "black" list, and as far as my judgment goes rightly, but I should be very glad to know what her position really is.

The National is our law-giver, like the Marylebone in cricket, or Wimbledon (for the new shooting ground will be unable to shake off the aroma of the name of Wimbledon for a long time) in rifle shooting. The rule of head quarters must be law, and I apprehend must govern the ideas and decisions of judges, even when the exhibition is not affiliated to the National. As nothing is more annoying to the exhibitor and the judges than disqualification the point should be definitely settled.—Y. B. A. Z.

THE ROSE CONFERENCE.

I HAD looked forward much to the Rose Conference. I had never been to the Royal Horticultural Gardens, or, as it chanced, to any part of the neighbourhood of Chiswick, and, as a humble lover of gardening, I hoped to see much to instruct. Class 1 in the schedule of exhibits was a magnificent idea, and as an exhibitor I expected a wonderful sight, worthy of the highest gold medal ever struck. I was much interested in the prospect of seeing and hearing some of the great French Rose growers, and was prepared to listen respectfully to the learned Doctor from St. Petersburg, but I am not acquainted with the Russian language, and confess that I contemplated the possibility of new Roses with Russian names with consternation.

The excellent book of arrangements instructed me, hailing from the east, to find my way by rail to Gunnersbury station, which the map showed to be near to the gardens. I did so in good time, and having alighted alone, inquired my way of a railway official. "Jem," says he to a subordinate, "Where's the Show?" It was rather odd, I thought, that he did not know himself, and under the circumstances I was not much surprised that Jem was nearly as ignorant; he could only opine that it was "Somewhere past the Green." I would inquire outside, and did so of a man mending some palings. "Can you tell me the way to the Royal Horticultural Gardens?" No, he knew nothing about it. "Do you mean to say," said I, wondering more and more, "that you never heard of the Royal Horticultural Gardens?" "No," he answered emphatically, "I never did, and what's more, I —" Ah! a vulgar fellow, but I will inquire at that respectable shop, where I shall be fully directed, no doubt. The chemist was most courteous, but he, too, appealed to his boy, and the underling again was not without a glimmer of knowledge. He also fancied it was "Somewhere past the Green." "The Green?" "Yes, Turnham Green." Ah! to be sure; this was more like. A very old conundrum, which alluded to the boiling of Peas, came into my mind, and suggested at least a flavour of horticulture. I started, therefore, in the direction which I was informed would lead me to the Green, and very soon was fortunate enough to meet a policeman, leisurely strolling along his beat. Ah! I thought, now I shall be accurately directed; how useful these men are to wandering strangers from the country like myself. "Can you tell me the way to the Royal Horticultural Gardens?" Of course, his face brightened with intelligence at once. "First turn to the right, and you will see the Gardens before you just at the bottom of the street." Much cheered I hastened on, and there they were. But I don't see any entrance gate. "Hullo! what's this?"—"Messrs. —, Nurserymen, &c.," on a large board. Fortunately my mind had not time to grasp the full enormity of the fact that even the policeman of the place did not know of the existence of the Royal Horticultural Gardens,

before I spied the nurseryman himself among his young trees. He did know, and kindly directed me, and in a short time I was entering the gates, less sanguine than before, but at least in the company of a real live rosarian, Mr. B., who joined me as I came in.

Now for the exhibition tent and class 1. Well, I think we will draw a veil, confess Sutton to have been first and Chiswick second in exhibition Roses on July 2nd, omit any reference to classes, and briefly mention anything that appeared worthy of note to a lover of Roses and Rose shows. A very fine bloom of Madame Laeharme, as good a specimen as I ever saw, quite equal to Merveille de Lyon, caught my eye in some stand whose owner's name I have forgotten, and showed that one great flower at least had escaped the clutches of Sutton. Messrs. Rumsey showed Julius Finger, H.P., and Viscountess Folkestone well, and a fine bloom of Madame Montet came from Messrs. Keynes and Williams. Of newer Roses the buttonhole Noisette L'Idéale, shown by Mr. G. Paul, is charming, and will make a beautiful pair with W. A. Richardson. Rosa rugosa alba is lovely; there is such distinct character in the foliage and refreshing vigour and brightness of green in the young shoots that it is a beautiful plant by itself, even without the fine single white flowers or the bright red hips which follow. Duchess of Albany, H.P., is, I hope and do not doubt, better than as shown. Of the character of the botanical specimens I am not competent to speak, but I had hoped to see many appliances for Rose growing shown, and had intended to exhibit some caps for protecting Tea blooms myself, but had not been able to test them sufficiently.

And now, after some refreshment, for the Conference. The President's opening address was capital. It was, perhaps, in some degree his fault that the readers of papers which followed seemed dull by comparison, but where were the foreigners? Alas! they were not there. And at the conclusion of Mr. W. Paul's interesting paper on Rose classification, I left to catch my train, wondering at the quantity of groups and sub-species that are unknown to myself, and some others perhaps, whose Rose world consists of nothing but H.P.'s and Teas, and thinking how difficult it will be to disentangle them all twenty years hence at the present rate of hybridising. How interesting, by-the-by, a paper on the breeding of Roses would have been, not only on the raising of chance seedlings by some of the French growers and our own two Pauls (though perhaps these last do hybridise), but also by Mr. Bennett par excellence, whose seedlings have made such new departures, and by Messrs. Dickson, who, though hampered by distance from the metropolis, have yet accomplished such good results, and earned our confidence in the new Roses they issue.

I have not heard any account of the proceedings on the second day. We know that the Royal Horticultural Society has had of late many difficulties to contend with, which we trust may be successfully surmounted, so that it may take and hold its proper position in the country. It must still, however, be a matter of regret in the interests of the Rose that the Conference was not a more pronounced success; but no blame on this head can possibly be attached to Messrs. Mawley and Wilks, of whom it may well be said:—

"Tis not in mortals to command success:

But they did more—deserved it."

—W. R. RAILLEM.

RED SPIDER.

RED SPIDER is, perhaps, the most destructive of all the insects which the horticulturist has to combat. Being small, and confining its first attacks to the under side of the leaves, it is not easy of recognition in its early stages of development; but in a very short time foliage attacked by it assumes a sickly, yellowish appearance on the upper surface, and the parts immediately over the spots where the insect is at work become dotted with a number of minute whitish specks if the leaves are those of the Peach or Fig tree, but if they are those of the Vine the specks are of a yellowish hue. These specks or dots increase in size until the whole leaf acquires a yellow and mature appearance, and its powers of exhalation and inhalation being destroyed it falls off. The small specks or dots on the upper surface of the leaves are the best evidence of the presence of red spider, and if the under side of such leaves be examined there will be observed between the principal nerves a number of minute insects. These, on being touched with the point of a pin, will be seen to move about at a rapid rate, and if observed with the aid of a lens they will be found to be in constant motion, busy on that part of the leaf which they have for greater security enveloped in a network of the finest threads conceivable. If measures be not taken to check the spread of the insect on its first appearance it will rapidly wrap the leaf in a fine network, and will not cease its work of destruction until the juices of the leaf have been so completely exhausted that it becomes totally incapable of performing any of its functions, and falls.

It is well to remember that the leaf of a Vine or other plant may have every appearance of being attacked by red spider, and yet that the insect may not be present; for the upper surface of a partly scorched leaf has much the same aspect as one suffering

exhibitor as the duplicated classes, I think that it is a truer test of the skill of any grower to win where all the blooms are required to be distinct. I am a strong believer in challenge cups both for the exhibitor and the society who offer them, as I consider no other form of prize will add to the reputation of both so much. But even challenge vase competitions must have a limit in number. The Kingston Society have also encouraged those growers who have never taken a prize for cut blooms in open competition, and all classes of cut blooms are represented at their exhibitions. They were, I think, the first to recognise the merits of the new Japanese Anemone class by offering prizes specially for them.

Kingston Drill Hall has long been noted for its groups of Chrysanthemums; in fact the first groups of the kind now so much in request at exhibitions were staged here by Mr. Orchard, who is the generally acknowledged pioneer of the method of cutting down plants with a view to obtaining dwarf plants for grouping. Many first-class trained plants have also been staged. One other class at Kingston must not be omitted—table plants, which have been here staged in great profusion and of excellent quality. The Kingston Society, like many others, publish the names of the judges in the schedule. This I consider to be a good plan, as it gives confidence to the exhibitor when the judges are known to be competent men. Chrysanthemum judging requires a special training which does not fall to the lot of every gardener. — E. MOLYNEUX.

HETHERBURY, GUILDFORD.

THIS, the residence of H. Selfe Leonard, Esq., is a substantial villa in a commanding situation on the Portsmouth Road. From it there is an excellent view of Guildford with the sluggish waters of the Wey which abound with the yellow Water Lily (*Nuphar lutea*). In full view also there is the old castle of Guildford, the ruins well preserved, and the adjoining grounds laid out in gardens for the benefit of the people of Guildford. The nature of the ground afforded an excellent opportunity to a landscape gardener with an eye to the fitness of things to lay the place out in keeping with the old castle to form, as it were, a harmonious whole; but the gardener was not forthcoming, or his plans were rejected in favour of the geometrical form of garden with its usual concomitant of bedding plants, sub-tropical plants, and a squirting fountain to amuse the children.

It is a great relief to turn to Mr. Leonard's garden laid out in terraces and arrangements of rocks and stones for hardy herbaceous and alpine plants; where every subject is a study by itself, and choice delicate alpines or sturdy herbaceous plants are placed in positions best fitted to their natural requirements. Roses find a prominent place in the garden; and there is also a corner for bedding plants, for we find a colour in the crimson and scarlet of Zonal Pelargoniums not to be found in herbaceous plants at any season, and those who would banish bedding plants a together from the garden must be content to be without brilliant masses of crimson and scarlet, not to mention the lovely shades of rose and salmon colours.

Show Auriculas, Alpine Auriculas, and some of the choicest Primulas are grown in pots. Frames and pits are wanted for many plants of a delicate nature, and unless they are grown in them and sheltered from the weather there is in many seasons a chance of losing them altogether. Many plants are hardy enough as regards frost if they can be kept dry during winter; but this is not possible in our insular climate, and so it happens that wise men who have valuable or choice plants in their possession will take care not to lose them, nor will they place them in a position where they linger out a miserable existence. When a good stock of any particular species has been obtained plants of it may be trusted out of doors in the position that is thought most suitable for them, and experiments may be made with choice plants out of doors in winter, which it would not be safe to make unless a small reserve was held under glass. This remark specially applies to the Primulaceæ. Of this genus Mr. Leonard possesses a very full collection; indeed, a great deal of labour has been bestowed in making the entire collection of hardy plants as complete as possible. I was rather surprised to find so many in flower about the middle of July. The finest display is in May and June.

Some of the Lilies are very beautiful. The fair white *Lilium candidum* was in its prime. It is the loveliest and sweetest of garden flowers, and is best left alone to its own sweet will. Masses of *L. testaceum* were very beautiful; its delicate nankeen colour had a fine effect. *L. pardalinum* is one of the handsomest of garden plants in July, and in good soil grows as tall as a man. Two handsome Acheilles were conspicuous objects. The tallest of the two, *A. eupatorium*, had stems about 5 feet high, each of them furnished with large umbels of golden flowers. *A. ægyptiaca* is not more than half as tall, and is much like the other as regards its umbels of yellow flowers.

The handsome *Platycodon grandiflorum* was flowering freely, and quite as tall again as it grows in our garden. The deep blue colour of the flowers, 2 to 3 inches across, are very effective in the rock garden.

Actæa alba is thought highly of as a tall-growing decorative plant. It is the white Baneberry, producing white berries with red stalks from its bottle brush-like flower spikes.

Dictamnus Fraxinella, flowers pale purple and pure white, are splendid garden plants. Although we have grown this plant for years I never noticed that its seed pods were perfumed like the Lemon-scented Verbena.

Heuchera sanguinea was freely producing its spikes of blood-red

flowers. This is a new or at least recent species, and is an excellent plant for the front rows of herbaceous borders or the rock garden.

Erigeron mucronatum (*Vittadenia triloba*), is a very pretty Daisy-like free-flowering plant. It is termed the Austrian Daisy; the flowers open pinkish and change to white, so that a dense mass of flowers have a charming effect.

Two Gentians were in flower, both of them producing their flowers in clusters on erect stems—viz, *G. septemfida* and *G. cruciata*. The Gentians are all beautiful and interesting plants, and do well in Mr. Leonard's garden on the chalk.

Dracocephalum grandiflorum is a beautiful plant, well grown here. Its intensely blue Salvia-like flowers cannot fail to please. *D. altaianse* is also a very pretty plant, with Gentian blue flowers.

The *Ranondias* are grown in great numbers, mostly in pots. The purplish-flowered variety plentiful, the white form scarce, and slightly tinged with blue; but, as Mr. Leonard remarked, for all practical purposes it is white.

Irises are grown in immense quantities, and the soil, though comparatively dry in summer, seems well adapted for the moisture-loving *I. lævigata* (syn. *Kæmpferi*), which was making vigorous growth.

Grand masses of the finest of the *Onosmas* (*O. taurica*) were in flower. Its drooping clusters of yellow flowers are distinct and pretty. *Edraianthus dalmaticus* was producing freely its heads of purplish flowers. Some of the dwarf *Linarias* were scattered promiscuously about the garden, the prettiest of them being *L. alpina*. *Dianthus* in many species, *Spiræas*, *Campanulas*, and *Digitalis* were abundant in the dressed garden. Outside of this is a space set apart for a wild garden, and a very pleasant place it is in summer, with all sorts of plants in a tangle—Poppies and wild Strawberries, Sedums, tall *Campanulas*, the *Rosa rugosa*, and the banks where the wild Thyme grows, Lilies towering above the tall Grasses, &c.

Rubus canadensis is a useful species for the margins of shrubberies. Besides his large garden, which one would think sufficient to absorb all the spare time of a busy city man, Mr. Leonard is much interested in the Millmead Nursery of Mr. Harper. It has been formed for hardy herbaceous and alpine plants principally, and they succeed admirably on the rich loam over the chalk. The leading feature of the nursery is to supply choice plants of this kind in large established plants at a cheap rate. An amateur may not succeed even with well established plants of difficult species, but he has a better chance to do so than if he received a scrap of a plant not well established. The climate of Guildford and the fine loam over the chalk seems right for alpine, but those who fancy there is a royal road to success will find themselves in error. The plants must be placed in the right positions, some of them in shallow high ground amongst rocks and stones, others in the deep rich loam of shady borders, and again others well exposed to the sun, and a man's heart must be in his work. Mr. Leonard has a good knowledge of the plants both as regards their names and their cultural requirements, and as regards the latter he is well seconded by his excellent gardener Mr. Harper. Together they have accomplished excellent work, which is not yet finished. The owner of the garden has his head full of large schemes for the future.—J. D.

VINES FROM SEED.

Sow in the open ground a Grape seed, bestow on the young plant all imaginable care, and you will have to wait at least five or six years before being able to eat the first bunch of Grapes. By forced culture this result can be obtained in four times less time. M. Etienne Salomon of Thomery has already shown Vines from seeds from fifteen to eighteen months old laden with golden bunches. This is the process for obtaining early fruiting. The seeds are sown in pots, which are placed in the frame of a conservatory, the temperature of which, kept during the first fifteen days at 68° Fahr., is afterwards raised progressively to 86°. Under the influence of this temperature the seeds are not long in germinating. The young plants rapidly increase in height, and as soon as they have two or three leaves they are again placed in pots 3 inches in diameter. After watering the pots are plunged in heat, and they are watered frequently in order that the growth of the plants may not undergo any check. When the pots are full of roots a removal to a larger pot becomes necessary.

It is not necessary to say that the nourishment given to the plant is in proportion to its growth. If the soil of the pot is not sufficient to nourish the Vine, the growth of which should be quickened, they must be watered with liquid manure—stable water and guano dissolved in water. The temperature of the house being always maintained at 86° one understands how rapid ought to be the growth of the Vines. The plants are pinched when they are 2 feet high, and again when the branches have attained a height of 2 yards.

The sowing being done in the month of February, the Vines have attained the desired development towards the end of summer. A little air is afforded them, and they are more and more exposed, until they may be taken out of the house without danger in order to ripen the canes. At the approach of cold weather they are taken into a cellar or under a shed to protect them from the cold. In December, January, and February they are taken to undergo the forcing process. The Vines in pots having their branches rolled in spirals on stakes, are at first placed in a temperature of 43°. Progressively the temperature is raised, bringing it at the end of from thirty-five to forty days, to 77° or 86° Fahr. If the operation is well conducted—that is to say, if the heat is gradually raised, and if the waterings are abundant, without, nevertheless,

being in excess, the plants flourish vigorously, and flowers appear from the month of March, a little more than a year after the sowing of the seed. M. Etienne Salomon presented for the first time in 1886 at the meeting of the French National Horticultural Society, seedling Vines, obtained by this process.—(*Le Voltaire*.)

NATIONAL CARNATION AND PICOTEE SOCIETY'S SHOW.

IN your kindly and appreciative notice of the above you remark that besides well-known growers like Messrs. Douglas, Turner, Henwood, and Phillips there were others represented whose names are not so familiar. There were also some older even than these. The doyen of the exhibitors, Mr. Joseph Lakin, was there. His name should be pretty familiar now, as he has been showing Carnations, I believe, since as far back as the forties, when he lived at Derby. I should grieve to number you among those who know not Joseph. Just as Dean Hole used humorously to speak of himself as the greatest clergyman in the Church of England, so Mr. Lakin might say that he was the biggest man at every Carnation show he attends, and not always merely by reason of his inches either. Some of the finest first prize twelves, both of Carnations and Picotees, have been staged by him. As a seedling raiser he is well to the front. Many of our best selfs have come from him, such as Polly Clarke, peach; Emma Lakin, the most beautiful of all the white selfs; Black Knight, purple maroon, a grand bloom of which was shown by Mr. Henwood; and I believe he has others as good to come. His two latest exhibited seedlings—a fine pink and purple bizarre, and an exquisite wire edge purple Picotee—were deservedly first in their classes on Tuesday. Hale and hearty, he is yet full of wrinkles, but they are the sort of wrinkles that young growers love to acquire, and which he is every ready to impart to them. Another old floricultural hand present last Tuesday, and rarely absent from a show of Carnations in the midlands or the south, is Mr. Thomas Anstiss of Brill, Oxon. The raiser of more than one good thing himself, he will perhaps be best remembered as the grower who first introduced the now famed Favourite (scarlet edge Picotee) to public notice some five years ago, when he showed it in a remarkably fine first six Picotees at South Kensington.

These two growers the last season or two have rather fallen away from their accustomed high positions as exhibitors, having evidently been drawn aside by the fascinations of seedling raising. One cannot eat one's cake and have it.—M. ROWAN.

SUMMERVILLE, Co. WATERFORD.

A MARINE RESIDENCE.

SOJOURNING at the beautiful health resort of Tramore, on the Irish south coast, some half dozen miles from the important town of Waterford, which is in direct steamboat communication with most parts of England and Scotland, and hearing much of the marine residence of the Hon. Dudley and Lady Camilla Fortescue at Summerville, I resolved to drive over and see what trees, shrubs, and flowers lived and prospered in the immediate neighbourhood of the Atlantic Ocean, for this charming place is situated just round Brownstown Head, and on an inlet of Tramore Bay.

Tramore is situated on a warm southern shelving slope of this broad bay, and is remarkable for being always dry and salubrious. One hour after the heaviest downpour finds the town and the wide-extending sandy beach—one of the finest promenades in the British Isles when the tide is out—perfectly dry, and tempting to the pedestrian, and here on the numerous grassy slopes and improvised gardens can be drunk in the ozone-laden pure Atlantic breezes. Though I feel I should be a benefactor to your readers in bringing this health resort at length under their notice, and I speak from an acquaintance with most parts of the British Isles, I must not further digress.

I was fortunate in finding the head gardener, Mr. J. A. Calthorpe, at home, and he courteously showed me around. The residence is extensive, and was built by the present worthy proprietor on his return from Ceylon about 1876, so that he might live on his estate and perform the duties of a resident landlord. Though connected with so many noble families in Great Britain, this, I understand, the hon. gentleman and Lady Camilla have done every year since, performing all the public functions their social positions involve. I mention this, as it is too common for Irish noblemen and gentlemen to abandon their residences and estates to agents, and of all the departments none suffers more from this than the garden.

The Flower Garden.—This is in front of the residence, and contains brilliant beds of the customary Pelargoniums in variety, among the rest one named Mrs. Huish (raised at South Moulton many years ago by Dr. Huish, the vicar), and retained at Lord Fortescue's and here since. It is a purple crimson, very brilliant—dazzlingly so—and even here comes perfectly round with large and numerous trusses. I doubt if Mr. Cannell has anything better for bedding. Another somewhat distinct and free blooming would be Sir John Franklin, seemingly an advance on Lady Sheffield. There were distinct beds—scarlet and white Vesuvius, from their brilliancy and rude health would seem not to object to a douche bath of marine spray, and this must be calculated on when the Atlantic is tempest-tossed. The same applies to beds of Madame Desgranges, Precocité, and Lyon Chrysanthemums, just now coming into bloom, purple and white Violas, Halleri, maximum, and Etoile d'Or Marguerites.

The Plantation and Pinetum.—These are extensively situated on the southern front of the residence, and under the special care of the honourable proprietor himself, evidently for the purpose of gradually finding out what trees and shrubs of the better class would be likely to do well with such unfavourable surroundings of soil and position. I only took the names of a few, and they will have an interest for those planting around marine residences. It goes without saying that all the hardier Firs, Spruces, Larches, and Pines grow freely, and after those the most numerous Coniferae were Cupressus macrocarpa, and what seemed robust growing varieties of it; Abies Nordmanniana, Cupressus Lawsoniana, Pinus excelsa, and several handsome specimens of Cryptomeria elegans. There are several others, but writing from memory and without books of reference I cannot include them. Among choice shrubs by far the healthiest and most numerous as well as most effective were the quantities of Escallonia macrantha—seemingly, from the numerous specimens I noticed, from the Isles of Bute to Eastbourne, Sussex; and from Antrim to Queenstown, the most suitable of all flowering evergreen shrubs. Then came Cerasus lusitanica and L. rotundifolia; Rhododendron ponticum, Quercus Ilex, Grisellina littoralis—I might have bracketed this with the Escallonia, and added Euonymus to make a good evergreen trio. By a wall of the garden very healthy were Forsythia viridissima, Berberis fascicularis, Jasminum nudicaule, Osmanthus rosmarinifolius, and Carpentaria californica. The Nepaul Laburnum and Rhus cotinus had a warm corner, and seemed to exult in it. Though I have had the New Zealand Flax (Phormium tenax) and Pampas Grass (Gynerium argenteum) killed outright inland, here they luxuriate. The same applies to a Fuchsia named sanguinea (12 feet shrubs, a mass of bloom); Hydrangea paniculata, Ligustrum ovalifolium, and Cistus laurifolius.

The Kitchen and Fruit Garden.—Here we arrived next and were greatly struck at the entrance with the floral wealth of the 12-foot central borders, backed by low concrete walls for training the customary espalier and cordon Apples, Pears, and Cherries, each being suited to the respective position and aspect they are found from experiment to do best in. Every gardener finds, as does Mr. Calthorpe, that it by no means follows that because Winter Nelis Pear does well against a wall with a northern aspect that the more fastidious and desirable Marie Louise will do so. On the other hand Cox's Pomona Apple will bear finely here where Ribston Pippin would have no chance. A constant experiment thus has to be carried on—testing soil, position, the weather, and mechanical appliances. I am sorry to say, looking back at my rambles through most gardens this year, the fruit crop is generally very unsatisfactory. Here, I understand, on most of the wall Pears and cordons the show of fruit, or rather flower, was most promising to-day, and after the storm of to-morrow all hope was lost, as some of the branches were wrenched off, not to mention fruit or flower buds. Beurré d'Amanlis has a few score fruit, however. Usually here Williams' Bon Chrétien, Winter Nelis, and Beurré Diel among Pears, and Cox's Orange Pippin, King of the Pippins, and Lord Suffield amongst Apples are the most satisfactory. There is a fine outdoor crop of Figs, and Mr. Calthorpe informs me they are usually very good. His greatest successes are with Melons, her ladyship prefers them to anything met with on your side, so frequent supplies must be despatched to the London residence. The method of growth is a heated pit—two 2-inch pipes in spring and sun heat in summer alone. The varieties are Blenheim Orange (Carter), Hero of Lockinge, and Horticultural Prize Gem. This last has the welcome peculiarity that it sets its own fruit. Mr. Calthorpe thinks this is due to a small black insect he finds passing from one to the other, male and female flowers, but I also noticed both grow close together on the same vines. Several vines had as many as four large Melons, from 4 to 7 lbs. each swelling. Strawberries are largely grown under considerable soil difficulties; the best old varieties were President, and now Elton Pine, Pioneer, and British Queen did fairly. Next year he means to have Noble, King of the Earlies, and from Mr. Gilbert's recommendation in the Journal, that other creditable hybrid of Mr. Laxton, "A. F. Barron." Sutton's Favourite, a crispy curling Lettuce, has the preference, and the finest piece of Spanish Onions I noticed this year was here, in Carter's White Spanish. Telegraph and Stratagem are still the favourite Peas of twenty varieties.

Vineries, Stoves, Intermediate, and Greenhouses.—Including divisions of the several glass ranges there are about a dozen houses, but it is hopeless to expect several valuable pages of the Journal to do them justice, nor is there so much necessity, as most of the occupants of the two last are in the open air, and much of the former are of the customary description. Mr. Calthorpe is a distinguished prize Grape-grower, and this year he is likely to maintain his reputation, especially with Lady Downe's, Black Hamburgh (both in the early and late vinery), Gros Colman, Buckland Sweetwater, White Alicante, Foster's Seedling, and Muscat of Alexandria. So far the crop is heavy, promising, and well done.

Though anxious to avoid editorial censure I cannot pass without allusion to a house of specimen Colouses, remarkably brilliant, tall, and richly coloured. The varieties principally were Duchess of Edinburgh, Ariel, Crimson Gem, Scapin, Lord Rosebery, Rosenthal, Elegans, and Countess of Dudley. In the stove noticeable were specimen Crotons, Dracenas, Marantas (six varieties), Calanthes, Dieffenbachias, Pandanus Veitchi, Phaius, hybrid Cypripediums, Lycopods, Palms, Tree Ferns, and tastefully interspersed here and there Grevillea robusta, Asparagus plumosus, and Acacia lophantha. There were large collections of Gloxinias, Caladiums, Begonias, Adiantums, and the customary good things in this and the succeeding houses; but I pass on, noticing the

profusion of such climbers as *Bougainvillea glabra*, *Plumbago capensis*, and *Schubertia suaveolens*, and the very remarkable specimens of *Adiantum trapeziforme*, *A. gracillimum*, *A. farleyense*, and *A. Williamsi*—the former the finest I ever noticed of the kind.

Knowing something of the *Summerville Chrysanthemums* as a judge for some years, I was not surprised on emerging from the houses to see about 300 varieties, including all the newest introductions, grown both for exhibition and winter decoration. The temptation is strong to prolong my notes where there is so much worth observing, but I cannot draw to a close without asking your permission to warmly acknowledge the hospitable and courteous welcome of Mr. and Mrs. Calthorpe, and to include therein the steward and manager, Mr. Fechney, who showed us many things well done in his own department—an excellent specimen of the intelligent Scotch agriculturist.—W. J. MURPHY, *Tramore*.

TRENTHAM HORTICULTURAL SHOW.

THE second Show in connection with the Trentham Horticultural Society was held July 25th, in the splendid grounds of Trentham, by kind permission of the Duke of Sutherland. The prospects of this young Society are very encouraging. The Show, which was a good one in every respect, reflects great credit upon the promoters; the arrangements, likewise, were perfect, the weather fine, and the company large. Free access to the greater part of this princely estate when opened to the public, which was highly appreciated. The Show was opened by the Duke, accompanied by the Duchess, and many ladies and gentlemen.

The principal feature in the plant classes were the groups arranged for effect. A splendid group, not for competition, occupying the whole end of one of the spacious marquees from the Trentham Gardens, was a great attraction. Many fine Orchids and foliage and flowering plants were arranged in an artistic manner. The first prize for a group in competition, open to all, W. Thompson, Esq., Stone, secured (Mr. Stevens, gardener). This group contained many fine Orchids. The cut flowers, especially Roses, were very fine. First secured in the larger classes by Messrs. Dickson of Newtonards, Belfast, who showed well for bouquets and buttonholes. Messrs. Perkins and Son, of Coventry, were first in a good competition, Mrs. Blair securing first for epergne, a graceful arrangement.

Fruit was shown in quantities. In the collection of eight dishes Mr. Thorpe, of Newark, was first, closely followed by Mr. Gilman of Ingestre, and Mr. Edmonds of Bestwood. For two or three bunches of black Grapes Mr. Wilkie, Creswell Hall, was first, Mr. Edmonds securing like honours for whites. In a strong competition for collection of vegetables found Mr. Fitzherbert to the fore, the quality being excellent. The amateurs and cottagers showed well, and are to be congratulated upon the qualities of their exhibits.

The band of the Royal Scots Guards, under the leadership of Mr. Holland, was engaged, and performed an excellent programme. Although such a number of people visited this Show not the slightest damage was done.

FRUIT FORCING.

VINES.—*In Pots for Early Forcing.*—Those that are to be started in November should now have the wood thoroughly ripe and the buds plump. If not, and they are later this year than usual, keep the house rather warmer by day, say 80° to 85°, closing early so as to raise the temperature to 90° or 95°, and throw the house open at night. Afford water (or liquid manure will help to plump the buds) in sufficient quantity to prevent the foliage flagging, and the latter cannot have too much light. Keep lateral growths well in check, leaving no more than are absolutely necessary to appropriate any excess of nutriment and to prevent the principal eyes starting. When sufficiently ripened, as they are when the wood is brown and hard and the buds are prominent, they should be removed to a position outdoors, standing on slates or boards in front of a south wall or fence, securing the canes to the face of the wall, only giving water to prevent the foliage falling prematurely, and having some waterproof material to throw off the rain from the pots. In this position they will have some rest even if the leaves are not actually shed. When the leaves turn yellow and give indications of falling commence reducing the laterals, and when the leaves are all off prune the Vines, the laterals being cut off close and the canes cut back to the length required. Afterwards put them in any airy, cool, dry place until required for forcing. Keep them dry, but not dust dry, at the roots, and place some dry protective material about the pots to save the roots from frost in case it should gain access to the structure.

Earliest Forced Vines.—The Vines will now require a dry atmosphere to thoroughly ripen the wood, but it will not be necessary to employ artificial heat. All laterals and late growths must be kept stopped, and complete rest afforded by having the house cool and comparatively dry. The borders inside may require water, but if they have been mulched it may not be necessary, whilst the outside borders may

need covering with dry straw or bracken to throw off heavy rains. This is absolutely essential to ensure complete rest, so necessary for Vines long subjected to forcing. A too moist condition of the soil tends to late growth, but there should be sufficient moisture to maintain growth in the laterals in order to prevent the premature ripening of the foliage. In most cases it will be sufficient to allow a moderate extension of the laterals. Where the Vines are in an unsatisfactory condition prepare for lifting at an early date, getting fresh loam and clean drainage, so that the work can be done quickly when started. There is no danger of losing a crop, only operate upon a portion of the border at once, say the inside border one year and the outside the following. It is desirable to lift the roots and lay them in fresh soil nearer the surface whilst the foliage is on the Vines, therefore work of this kind ought not to be delayed in the case of Vines that are to be started early in December, which will need pruning by the middle of September, or, in the case of lifted Vines, a little later.

Vines not Regularly Subjected to Early Forcing.—Those that have not hitherto been started early will need, as soon as the crop is off, to be thoroughly cleansed by syringing, or the application of an insecticide; and if there is any doubt about the ripeness of the wood or the plumpness of the eyes, it will be necessary to keep the house rather close by day, but with sufficient ventilation to cause evaporation and allow the moisture to escape. Give no more water to the border than will prevent the foliage becoming limp. If the weather prove moist employ fire heat in the daytime to maintain a temperature of 70° to 75°, with moderate ventilation, and turn the heat off at night to allow the pipes to cool, increasing the ventilation, so as to ensure a thorough draught, and this will soon cause the wood to harden and the buds to become plump, inducing rest, which for Vines that are to be started in December should be complete from the middle to the end of September. When the wood is ripe ventilate fully day and night.

Vines Cleared of their Crops.—Cleanse the foliage by means of the syringe or engine, and if necessary apply an insecticide. If there are any mealy bug or scale promptly use petroleum—a wineglassful to four gallons of water, in which 8 ozs. of soft soap and an ounce of soda have been dissolved, keeping the mixture thoroughly agitated by stirring briskly with a broomhandle whilst being applied to the Vines, which must be done thoroughly, wetting every part. It is best done on a dull, calm afternoon, and should be repeated two or three times at intervals of a few days. If there be any plants they must be removed; and if the roots of the Vine are near the surface cover with dry, short material, to absorb the waste. Keep the laterals fairly in hand, not closely pinched, unless the Vines are very vigorous, and are not ripening the wood well, in which case keep the house rather dry at night, with all the ventilation possible, and somewhat warm and close by day; this will tend to the maturity of the wood and buds. In stopping vigorous Vines regard must be had to the principal buds, not stopping so close as to jeopardise their starting into growth through an excess of sap. Such Vines should also be kept without water until the foliage is becoming a little limp. Vines that are not strong, having been enfeebled by continued cropping or other causes, should be encouraged to make growth by applying liquid manure to the border. But whatever superfluous foliage is made, it must not be allowed to interfere in any way with the free access of light and air to the principal leaves, which must be kept healthy, so that they may appropriate some of the extra food, and store it in the buds and adjacent wood. Ventilate freely day and night.

Grapes Colouring.—Admit air constantly, enough with a gentle warmth in the pipes to insure a circulation. Whilst ripening, many, indeed most Grapes, swell considerably, therefore there must not be any deficiency of moisture in the borders. Give, if necessary, a good supply, and in the early part of the day, so that superfluous moisture may be dissipated before night. If the Vines are heavily cropped afford liquid manure, but not strong, and allow them plenty of time, otherwise if there be any hastening of the ripening and a deficiency of nutriment the fruit may be defective in colour. A good rest at night in a temperature of 60° to 65° is a great help to Vines taxed to the utmost by weight of fruit. A moderate amount of air moisture is also essential to the health of the Vines, sprinkling available surfaces occasionally, and, if possible, allow the laterals to extend, but overtaxed Vines can rarely cater for more than the principal leaves and Grapes.

CUCUMBERS.—Any house or frame at liberty may yet be planted with Cucumbers, the frame having a bed of fermenting materials, which will give a supply of fruit in September and continue nearly to Christmas if due regard be paid to lining the beds and to protecting the plants by mats over the lights at night after the weather sets in cold. Let plants in frames or houses be thinned at least once a week, and in growing weather twice, removing exhausted growths to make room for young bearing shoots. Keep the shoots well stopped to one joint beyond the fruit, or at the fruit if the plants are vigorous and showing no signs of exhaustion. Always allow weakly plants more extension, and crop them lightly. Maintain a steady temperature of 70° at night, 75° by day, 80° to 85° with sun, closing early to increase to 90° or 95°, the bottom heat being kept at 80° to 85°. Maintain a steady root action by surface dressings of sweet lumpy manure, and pay due attention to watering two or three times a week. Syringe in the afternoons of hot days, but avoid late syringing, for the foliage should be dry by sunset, and commence ventilating early, as it is important that the foliage be dry before the sun acts powerfully upon it. The autumn fruiters should be planted on hillocks or ridges, moderately firm, maintaining a moist and genial atmosphere, and they will grow and show fruit in plenty shortly.

THE FLOWER GARDEN.

Layering Carnations.—Layering is the surest method of propagating border and other Carnations and Picotees, and the earlier this is done in August the greater the certainty of well-rooted plants being obtained. First loosen the surface soil round the plants to be operated upon, and then add a layer, 2 inches thick, of fresh loamy compost, to which sharp sand or road grit has been freely added. Select moderately long flowerless growths, trim off the lower leaves, and half cut through at a joint where the wood is moderately hard, give the knife an upward turn so as to form a tongue about an inch in length, and then carefully bury the cut part in the soil, a rather strong peg being necessary for keeping it in place. In dry weather water should be given whenever the new soil is approaching dryness, and by the end of September or early in October most of the layers will be sufficiently well rooted to be potted or transplanted. Choice border varieties in pots may be planted out on beds of fresh soil, nothing being better than a frame on an exhausted hotbed, with the lights taken off, and every suitable growth layered. These, when rooted, ought to be placed singly into 4-inch pots, and kept in cold frames or pits till the spring, when they may be either planted out or shifted into larger pots.

Seedling Carnations and Picotees.—These, if given ordinarily fair treatment, flower splendidly, masses of showy flowers being produced during the summer. In most instances a considerable number of single varieties are unavoidably included in every packet, but even these are attractive and serviceable. So freely do these seedlings flower that the majority fail to form growths for flowering during the following summer, and this necessitates raising a fresh stock each spring. If the advice previously given on this subject has been taken, the seedlings raised this season are now fit for finally planting out. As a rule Carnations and Picotees generally succeed on slightly raised beds formed in a moderately warm aspect. These may be 6 feet wide with a one-foot pathway between, the beds to hold five rows of plants, and which should be carefully moved from the boxes with a trowel and firmly replanted—without burying the hearts—about 12 inches apart. Carnations do not require a very rich soil, but if planted in succession to any other plants that may have exhausted much of the fertility of the ground, this ought first to have a liberal dressing of fresh loam and horse-droppings or old Mushroom-bed refuse forked into it. Slugs are liable to work sad havoc among tender young Carnations plants, and it is advisable therefore to place Cauliflower leaves, heaps of brewers' grains, or other traps among them, the slugs caught on these every morning being destroyed.

Dahlias.—Dull showery weather is most conducive to wood growth, and the plants are generally late in flowering. If quality, or say a few exhibition blooms, rather than quantity are desired, both the leading growths and the branches ought to be freely thinned and carefully tied to the stakes, or otherwise showery windy weather may break them. In order to obtain extra fine show blooms only a few flowers should be allowed to open at one time on a plant, all side buds being removed from the leading growths, and the latter, if it can be managed, should each be staked uprightly, some of the varieties also requiring to be sheltered both from heavy rains and fierce sunshine. Earwigs are apt to prove very troublesome to the grower of large double blooms, and these must be closely trapped and destroyed. They will collect in any dry material, and lengths of the hollow Broad Bean stalks tied to the Dahlia stems prove especially attractive to them. The old fashioned plan of inverting small pots filled with dry moss on the tops of the stakes also answers well, the earwigs collecting in these every night. Dahlias on poor ground will be benefited by occasional supplies of liquid manure.

Spring Bedding Plants from Seed.—There are several useful and showy spring flowering annuals and biennials that should be raised from seed during August and the early part of September. Wall-flowers, Brompton Stocks, Forget-me-nots, Primroses, Polyanthus, Alyssums, Auriculas, Pansies, and a few other perennials and biennials ought already to be large enough to transfer from boxes and pans or the seed beds to nursery beds, from which they may be eventually transplanted to where they are to flower, or they will not prove of much service. Such annuals as Sweet Alyssum, Candytuft, Collinsia bicolor, Cyanus major, Godetias, Limnanthes Douglassi, Saponaria calabrica, Silene pendula compacta, and Virginian Stocks that should be sown from the beginning to the third week in August, according to the locality, or whether naturally early or late. Slightly raised sheltered borders answer well for raising a number of these plants, the seed being sown thinly in shallow drills drawn about 6 inches apart, and if at all dry duly moistened prior to sowing. If the seedlings are lightly thinned out where at all thick the reserved plants may eventually be transplanted direct to where they are to flower, this being done in the autumn after the summer occupants of the beds are cleared off, or not till the spring.

PLANT HOUSES.

Gardenias.—Plants that were not allowed to flower in spring but induced to make growth in brisk heat should now be well developed specimens with hard wood. They should enjoy cooler and more airy treatment with exposure to full sunshine to further harden and ripen their shoots. This will have the effect of bringing growth to a standstill, and flower buds will quickly form. Young plants, or those that were cut back, may be placed into larger pots. If this is done without checking the plants they will quickly root freely in the new soil, and continue to make luxuriant growth. Fully expose these to the sun, and maintain the structure in which they are growing close and

moist. Use for a compost good fibry loam, one-third leaf mould, sand, and one-seventh of decayed manure. Peat is not necessary in the compost for these plants. If the plants are infested with scale or mealy bug it should be thoroughly eradicated now, especially from the early plants. Insecticides can be used stronger on those with firm wood and mature leaves than can be done with safety after the flower buds have commenced forming. It is a good plan to take the plants outside and wash off the bug with clean water, and then thoroughly syringe the plants with petroleum and water. Three ounces to each 4 gallons of water will be sufficiently strong to destroy scale. The application may be repeated at the end of a week or ten days.

Anthurium Andreanum.—Young plants raised from cuttings will have filled 5-inch pots with roots. These may be removed into 7-inch, using rough fibry peat, charcoal, and sand. The surface may be covered with living sphagnum. The soil at this stage need not be elevated above the rim of the pot. This can be done as the stem grows and roots are produced from it. Grow these plants under warm and moist conditions, and they will soon attain sufficient strength to flower more or less throughout the winter.

Alocasias.—These as well as all the ornamental foliage Anthuriums must be examined critically, for if red spider becomes established upon them it will quickly destroy their beautiful foliage. If it makes its appearance sponge the foliage with a weak solution of any insecticide recommended for the purpose. This should be followed by placing the plants over a tank, and thoroughly syringing them with the same or a similar solution, which should be repeated at intervals of a week until every trace has been destroyed.

Allamandas.—Where these and other similar plants are trained under the roof of plant stoves they must be judiciously thinned to prevent them overshadowing the plants growing beneath them. At this season of the year they grow rapidly, and would soon fill the whole roof if laid in.

Allamandas are very effective when they cover a good space thickly, and on this account are often left so thick as to prove a serious injury to other plants. The various plants beneath will grow quickly, even rapidly, and for the time look well, but they invariably fail soon after the approach of winter. The plants beneath must in most cases be considered as much as those on the roof, and therefore the shoots of the latter must be liberally thinned out directly signs of crowding are visible. Plants that are confined in pots and have been growing and flowering for some time should be liberally supplied with stimulants in a weak state, or top-dressed with manure and loam in equal proportions.

Leoras.—Plants that have flowered may be cut back thoroughly, cleaned, and started into growth in brisk heat, fully exposed to the sun. They will soon break into growth and flower again in early autumn. Cuttings may be inserted singly in small pots. The young growing ends strike freely in a close frame in a heated structure.

Paneratiums.—These will be throwing up freely and will bear removal to a cooler house without injury, so that a more lengthened succession of flowers may be had. Thrips are usually troublesome at this stage of the plant's growth. The plants can be kept clean by a free use of the syringe; but if they be infested syringe or dip them in a solution of tobacco water.

Gesneras.—Stimulants in a weak state may be given to the earliest hatch of plants. Continue to grow them in a close, warm, moist pit, where the pots can stand upon some moisture-holding material. Be careful that water does not fall upon their foliage, or it will become spotted and disfigured. Later plants may be placed into 5-inch pots in a compost of loam, leaf mould, and sand. Equal quantities of the two former may be used and a liberal quantity of the latter, with the addition of a little decayed manure. Grow these under the same conditions as the earlier plants.

Tydeas of the Madame Heine section should be placed in their flowering pots (5-inch); the same compost will do as advised for Gesneras, but a little more loam may be used with advantage. The plants need the same treatment in other respects, but need not be grown quite so warm. Plants that are established in their flowering pots may have their points removed to induce them to branch. These, as well as Gesneras, need shading from bright sun.

THE BEE-KEEPER

NOTES ON BEES.

QUEEN REARING.

THE season has been more favourable for queen rearing than was the summer of 1888. Half of our queens for next season's work are now laying. I have been supplying queens to people who had queenless stocks as "A Hallamshire Bee-keeper" advises—namely, catching the queens as they issued with after swarms. Often we get as many as a dozen at a time, and this is one of the main causes why bees abscond after being successfully hived. I quite agree with "A. H. B. K." regarding the treatment of

young queens. The first meal has more influence on their after usefulness and productiveness than some suppose.

My other half of queens with a few extra are taken from a stock after it had swarmed once, and divided into nine nuclei, each containing three shallow frames and either a hatched-out queen or having one or more cells, the poorest and weakest looking being destroyed. It is not always the queens that destroy the unhatched cells or rival queens. The workers do both as frequently as the queens do.

Owing to the nature of the season there is more honey stored in the body of the hives than usual, so much so that each lot of nine nuclei will require no feeding, which lessens the risk of their being robbed; but from our strong stocks, when nine only are created, the bees are numerous enough to defend themselves if a narrow doorway is given and no work done likely to incite robbing. I have frequently made a dozen to fifteen nuclei from one stock, but when the bee-keeper can afford it, it is better to have the lesser number.

BEE FLOWERS.

Before this appears in print our bees will be amongst the Wild Thyme and the Heather bells, as well as the "bright-eyed" Veronica, which is a honey-yielding plant, and a favourite of the bees. While speaking of flowers I enclose a spray of a Sedum (for naming), one of richest in honey and pollen of any flower, and will grow like other Sedums on soil that few other flowers will. There are few plants that flower so profusely as it does, therefore it must be a profitable one to plant by those who cultivate flowers specially for their bees. There are various shades of colour in this species, and once established, which is easily done, the plants soon give a carpet of flowers.

EXTRACTORS.

Since the extractor came into use this is the first year that its usefulness has been recognised, but even when required we can dispense with it. When our hives are top heavy beneath the supers, it is only the work of a few minutes to transfer the honey frames on the top to the under box, the latter frames and their contents taking the place of the former, this done on a day when no honey is coming in; and if the seals of the comb be scratched a little the honey will soon be taken to the supers by the bees and stored in them in a purer state than if extracted by a machine when every cell was not sealed, and this too with less loss. The divisions are hinged at the back, so that an empty box is all that is necessary to put the frames in for a few minutes, until room is made for their reception by the removal of those in the second box operated on. This is a much better plan than inverting combs; besides, the form of hive reduces the number of appliances in the apiary—a desirable thing of itself.

I thank "A. H. B. K." for his response to my request. The subject will be studied and experiments made with the view of bringing to light all the essential points necessary to queen rearing, for without perfect queens the labours of the bee-keeper are in vain.

THE WEATHER.

For several weeks past the weather has been showery, and practically put an end to the Clover honey season while it was at its best. Our bees were removed to the Heather on July 24th, to the most beautiful bloom of wild Thyme and Heather that has ever occurred to the memory of the oldest person, so the prospects before us are promising indeed, and being three weeks earlier than usual there is a greater likelihood of a large yield. It was the coldest morning we had had for many weeks, the thermometer registering 39° Fahr. with us, but at the Leadhills it was reported that a frost had been experienced having the aspect of a Christmas morning; but it is in the valleys, and not on the hills, that the frost injures vegetation. The climate in that locality is good and invigorating, and the best for restoring the health of invalids that I have experienced. Our bees were transmitted to their standing place more expeditiously than previously, owing greatly to the

proprietor of the Hopeton Arms placing at our disposal a more suitable conveyance.

BEE TOPICS.

While on our journey I had the privilege of being in company with a gentleman bee-keeper. Naturally our conversation was greatly on bees, honey, &c. The idea of bees dropping formic acid into the cell upon the top of the honey just before being finally closed, similar to what our ancestors did to their preserves by pouring a little spirits on the top previous to covering to prevent fermentation, was discussed, my opinion being that bees perform this generally throughout the whole mass while the honey is in the stomach, which can be detected by the change of the flavour of any syrup when taken and tasted directly from the stomach of the bee.

The discussion on the above brought in other topics, among which was that of the injurious effects unsealed honey had upon numerous individuals. The gentleman in question has exerted himself greatly to discover the cause why honey should be injurious to anyone, and invariably he has discovered that it is only in cases where unsealed honey was partaken of that left any ill effects on the individual after. At this stage a stranger gentleman in the same compartment who had been listening to the conversation asked "if he might be allowed to give an explanation." This granted, he continued by saying that he always used honey in the house as food and medicine. For many years he had his supply from Ayrshire, but the connection being broken he applied to a Glasgow house and procured what he considered equally as good honey; but everyone who partook of it was seized with illness, and this on every occasion it was eaten. The honey did not granulate properly, and it was proved afterwards to be unsealed and extracted honey. The above bore out the evidence of my friend, and convinced me that some kinds of honey contain poison until the heat of the hive volatilises it. Such crude honey taken from the combs by an extractor also contains water and pollen the bees intended for their grub, and which never would have entered the composition of honey had the bees been allowed to seal it.

We have frequently advised bee-keepers to be careful to place nothing on the market but honey taken from naturally sealed combs, thereby obtaining a good reputation for themselves and their honey. But there exists a strong desire in some to be rich, and the advice has been disregarded. It is now our duty, under the existing circumstances, to warn the public against buying honey unless that which has to their knowledge been taken from sealed combs. If bee-keeping is to be a success combined with pleasure, the bee must be allowed to complete her work, and all the inventions, which were to some extent intended to supplant her, must fall to the ground; then will there be a greater demand for honey, and the right sort of bee-keepers will increase, and the public will be satisfied and benefited.

ANGLED TIN BAR SECTION CRATES.

It is now several years since I recommended through this Journal the use of angled tin in hives and in section crates. In 1884 I exhibited a hive containing the different arrangements, and was awarded the first prize for it, as I was for many others when in competition with the leading bee-keepers and hive makers of the country, the Judges in this case being practical bee-keepers. The exhibit showed the arrangements for both super and section. The former had a permanent wire or saw web to sever any comb that might be attached to top of hive. Like many other good things, however, it was not at the time much valued, but now it is becoming popular both here and in America.

They are easily made and useful. Tradesmen have machinery which can turn them out both quickly and neatly, but there are some who cannot afford to buy, but who could make them. The following instructions will, I doubt not, help them to it. Get two pieces of hard wood—beech is good—the length, less the thick-

ness of the tin, of the inside of the crate, and 3 inches broad by $1\frac{1}{2}$ thick. Bore two holes to receive bolts about 3 inches from the ends, the exact depth down to the top edge as the half of the tin, which may be $2\frac{1}{4}$ in whole, the half being $1\frac{1}{8}$ to top. The bolts will do with common nuts, but are more handy if little handles extend. After the tins are cut to proper sizes insert the tin and bend to right angles, then take out and close the edges with a wooden mallet; when fully closed pierce a hole for screw, nail close to where the angle will be, now insert the doubled tin again between the blocks, this time three-sixteenths or so above the top; the proper gauge for this is got by two additional holes the proper distance above the line of the top edge of the bolts, which receives two wire pins. Screw the blocks tightly, and separate the edges, which form the ledges, and again beat down. Before inserting the last time cut the tin exactly at the wideness of the crate; it should be nearly an inch from the end, and where the hole should be as near the top edge as possible. When the angles are formed turn the ends round before removing, and the thing is complete. Each piece will cost from one halfpenny to a penny each, according to the weight of the tins. When screwing these on to the crate have two pieces of wood with saw serps the exact width between, that will suit the sections. Nail a lath on each end of these gauges, laying them on the bottom edge of the crate, which for convenience is uppermost, now slip the angled tin into these saw cuts, and screw the tin tightly to the crate. It is not absolutely necessary that there be a tin for the top, but it is an advantage; these do not require the angle or ledges. Where sections are used with bee ways nothing else is required, but when sections of one width throughout are used it is necessary to have distance guides of some sort, a bit of one-eighth sheet lead cut into narrow strips of the desired width, and about $1\frac{1}{2}$ long, then bent in the middle, and made to ride and slide upon the top edge of the tin, is simple and excellent for the purpose. Thus the material for a crate to hold twenty-eight 1 lb. sections will not cost more than from 6d. to 8d., and the time to make will not be more than an hour.—A LANARK-SHIRE BEE-KEEPER.

[The plant referred to is *Sedum ibericum*.]

TRADE CATALOGUE RECEIVED.

W. Baylor Hartland, 24, Patrick Street, Cork.—*Book of Daffodils* (illustrated).

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Book on Roses (*J. D.*).—We cannot possibly undertake to say which we consider the "best" book on Rose growing. The different works have been reviewed in our columns.

Books (*J. D.*).—We have never answered a question in the form you request, nor are we likely to do so, as such an answer as you wish would imply condemnation of meritorious works. Reviews of several books have been published. (*C. T. H.*).—Perhaps Mr. Shirley Hibberd's work will suit you, published, we think, by Messrs. Groombridge and

Sons. We do not remember the price, but it will be less than your name.

Paulownia imperialis (*F. Smith*).—The tree must be growing in an unsuitable soil or situation, as, apart from the actual injury to the texture of the leaves, they have an extremely unhealthy appearance. We do not think the cause you assign could have produced such effects without seriously damaging the tree.

Shrubs for Border (*J. W.*).—In addition to those you have, which are some of the best for your purpose, the Gold and Silver Tree Ives—namely, *Hedera arborea aurea* and *H. arborea elegantissima* are fine, *Laurustinus* good, also *Osmanthus ilicifolius variegatus nanus*, *Taxus baccata elegantissima*, *Cupressus Lawsoniana erecta viridis*; *lutea* and *nana glauca* are also very pretty. *Yucca recurva* may be mentioned as a graceful plant suitable for the purpose.

Temperature of Stove, &c. (*Cambridge*).—The night temperature of a stove in the summer months should be 70°, falling to 65° in the morning, or even 60° occasionally. In the daytime the temperature should be kept at 70° to 75° by artificial means, on cloudy days but with clear intervals keep at 80°, and in fine weather the temperature through the day should be 85° or 90°, closing sufficiently early each day to raise it to 90° or 95°, or a little more with plenty of moisture. The propagating house must have a steady temperature of 70° to 75° by artificial means, and in hot weather it will probably be 80° to 85°, the shade making the difference between the temperature in that and an ordinary stove.

Tomatoes Diseased (*F. W.*).—We are glad to know our advice has been of good service to you, and that you have succeeded in checking the development of disease, but judging by the foliage submitted you are by no means rid of it, and a close humid atmosphere would most certainly favour a destructive spread of the disease. Plenty of dry air, both night and day, is the best remedy, and this coupled with a firm root run and uncrowded houses is the only way to combat this most insidious disease. In many instances where these conditions have not been maintained the fungus has spread to a most disastrous extent, not a sound leaf being seen among thousands of plants. You have every reason, therefore, to be well satisfied with the capital crops you are marketing, and it is to be hoped you will succeed in cutting as many Tomatoes as you are ambitious to do—viz., three tons of fruit. Your stock is undoubtedly tainted, and we should much prefer to save seed of the selected variety from plants grown in the open air. If this is impossible we would yet save seed, and watch the seedlings closely. The disease is sometimes apparent in quite young plants. Tomato Advancer will probably be offered for sale in due time.

Carnation Souvenir de la Malmaison (*B. B. C.*).—If your plants are dwarf with good stout shoots at the base, transfer them to pots 2 inches larger. Drain the pots liberally, and press the soil moderately firm. Do not disturb the old balls farther than is necessary to remove the drainage. The soil may consist of good fibry loam two parts, the other part being composed of leaf mould, sand, and decayed manure. One-seventh of the latter will be ample. Stand them outside and water carefully afterwards. If possible, peg the shoots down on the surface of the soil after they are potted. If you wish to preserve the plants for flowering another year, and the growths are long and straggling, the shoots may be trained carefully to stakes after the plants have been potted. When this is carefully done straggling plants may be considerably reduced in height and converted into creditable bushes that will flower again freely another year. To increase the number of your plants, the shoots may be taken, inserted singly in small pots, and stood under handlights until they are rooted. The plant may also be placed out in a sloping direction, and all the growing shoots layered, which, when rooted, can be taken up and potted.

Ficus elastica (*Idem*).—If the pots are full of roots we have no doubt that repotting would improve the plants. You can pot them at once, employing pots 2 inches larger than those they are now in. Do not disturb the old ball further than is necessary to remove the drainage. The soil may consist of good loam and sand, with the addition of one-seventh of manure. Press the soil firmly into the pots. Water carefully until the roots are spreading freely into the new soil.

Marguerites (*Idem*).—These are propagated by cuttings of the young growing shoots, and root freely at almost any period of the year. For bedding, they can either be rooted early in September or early in the spring. We prefer the latter, because large plants can quickly be produced by liberal treatment. From June to September they root freely in any sandy soil in cold frames, either singly, or a number together in pots. Cuttings are liable to damp during the autumn, but root readily enough in a temperature of 60° during the spring months. Plants rooted in August, grown cool, and their shoots pinched, will flower towards the end of March. Cuttings rooted early in the spring will succeed these. Root a few at intervals of a month or five weeks, and you should not be without flowers. Plants rooted in April and May, and then grown outside, will flower splendidly during the autumn. If you want large specimens, plant out spring-rooted cuttings; lift and pot them in September; winter them in a cool house, and they will yield quantities of flower in spring.

Culture of Aphelandra Roezli (*F. R. M.*).—The following note by a successful grower will answer your question:—This is a handsome plant either for the stove or for room decoration. The flowers are of very short duration in a cut state; indeed, for this purpose it is of little

use, as the whole spike is never fully out at one time, and, moreover, the expanded flowers are so very easily shaken from the spikes that the least touch causes them to drop. This *Aphelandra* is easily propagated either by cuttings or from seeds. The latter mode is by far the best; from seeds they grow much stronger, producing finer leaves and flower spikes. The seed is very readily produced if the plants are kept in a dry high temperature when in flower, and not allowed to become dry at the roots. Plants in flower about Christmas will under ordinary treatment ripen their seeds by May, when they should be sown in a moist heat and well shaded; indeed this is a very essential point through all their growing period, for if exposed any length of time to direct sunshine the foliage soon becomes twisted and hard, with, in most cases, a drooping tendency. The seeds should be sown on the surface of a propagating bed, that is, if the material which covered the bed is old leaf soil or spent tan. They germinate freely without any covering, and when the plants are large enough to handle they should be pricked singly into thumb pots, using a mixture of leaf soil and silver sand, placing them on a shelf close to the glass. In three or four weeks they will require a shift into larger pots, say 5 inches in diameter. The soil this time must be more substantial, and consist of good fibry loam two parts, one part of sheep droppings or cow manure, and one part of crushed charcoal and a dash of sand. They should be potted very loosely, care being taken in draining the pots that a little charcoal is used with the crocks, as it tends to keep the roots healthy. If the plants when in flower are removed to a little lower temperature than that in which they have been grown their flowering season will be prolonged. They enjoy supplies of weak liquid manure twice a week all through their growing season; it enlarges the foliage and imparts a deep silvery sheen.

Wireworms in Gardens (R. F.).—We know of no "easy method" of eradicating this pest. Perhaps Mr. Luckhurst's experience may be useful to you, but you may not regard his plans as "easy." He has recorded:—"Very early in the year a field was placed under my care as a kind of auxiliary kitchen garden for the cultivation of Potatoes and other culinary roots. The soil, which for many years had been stirred no deeper than about 4 inches by means of a light one-horse plough, was found to be in a very poor, almost inert condition. A liberal dressing of rich farmyard manure was carted on to it; it was well stirred and thrown up roughly to a depth of fully 9 inches with spades, and in due course about an acre of it was planted with Potatoes. Now, neither in digging nor during the planting were many wireworms perceptible, yet, upon examination a short time afterwards, there was hardly a tuber without several wireworms attacking it—some just commencing operations, others which had burrowed so deeply as only to leave a short portion of their wiry bodies visible, while all with unerring instinct were gathering to the richest feast they had probably met with during their existence. Such an unpleasant occurrence might be regarded either as a serious dilemma or as a capital opportunity of clearing the soil of such a pest, and so saving not only the present but future crops from its ravages. While taking the latter view, the former one, which seemed to point to possible failure, was only felt as a spur to exertion, and a couple of men were immediately set to take up the Potatoes one by one with trowels, destroying every wireworm that could be found, and replacing the Potatoes in the soil as they went along the rows. It was a long and tedious job, but it was undoubtedly a thorough one, for it was computed that upwards of ten thousand of the enemy were destroyed; and so the battle was gained, the crop proving an excellent one, sound and free from every blemish. The experience which has thus been gained will prove invaluable in future practice; and wherever land is found to be infested with wireworms I feel assured that Potatoes placed a few inches beneath the surface, and about 2 feet apart for a week or two, will prove an unailing bait to lure them to destruction." If any of our readers can inform us of an easier and at the same time effectual mode of extirpating wireworms, we will readily publish it.

Vine Leaves Scorched (M. N.).—The cause of the withered condition of the leaves we attribute to defective ventilation, due provision not having been afforded for the exit of dry heated air, and this has encouraged the increase of the small insect, but great Vine pest, the red spider. There is no cure for such leaves as those you have sent, but the evil may be prevented from spreading to the others with better management. At no time should the top ventilators be closed entirely, except for an hour or two after syringing or damping the house in the afternoon, opening the top ventilators an inch or so at nightfall, and increasing the openings immediately the temperature commences rising in the morning. Carefully remove the worst leaves and burn them, and you will destroy many insects that you will not see. Syringe the Vines as violently as you can short of injuring the leaves. A mere squirting will be of no use, but point the syringe between the bunches and drive the water directly to the under side of every leaf, thus giving each a thorough washing. If this work is done thoroughly not many insects will be left on the foliage. Use a gallon of water to each square foot of roof, more rather than less. One good washing of this kind weekly will be more effectual than daily sprinklings. This washing should be done soon enough in the evening for the Vines to get nearly dry before night. Syringe every part of the house well every evening in sunny weather; let not a dry spot remain on soil, walls, or woodwork; also immediately after the sun has left the house, and the Grapes have stoned, sprinkle the paths well with liquid manure. Guano water will do admirably, 2 ozs. of the fertiliser being dissolved in a gallon of water;

but take care to open the top ventilators three or four hours afterwards, as above advised, leave them open all night, and give more air as early in the morning as is required, even if this be at five o'clock, the time depending on the position of the house for receiving the morning sun. Water the roots of your Vines copiously if the soil is in the least dry, not on the surface only, but 2 feet below it. If you carry out these instructions as we should act on them ourselves, your Vines will improve. Late syringing may be done in sultry weather, not on cold wet nights. It is much better to shade Vines lightly than to let the leaves and berries be scorched, as yours are. If your Vines are over-cropped remove some of the bunches.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*H. F. E.*).—1, *Hypericum Uralum*. 2, *Pteris serrulata cristata*. 3, *Adiantum cuneatum*. 4, *Grevillea robusta*. (*W. W., Manchester*).—The Corn Mangold, *Chrysanthemum segetum*, a native plant, but much grown now in gardens. (*H. C. W.*).—We do not undertake to name Roses. (*T. H.*).—1, *Rudbeckia laevigata*. 2, Not recognisable. 3, *Malva moschata alba*. (*J. G., Stoke Newington*).—1, *Pyrus Aria*; 2, *Catalpa bignonioides*; 3, *Acer campestre*. (*W. T. T.*).—The plant is *Rubus chamaemorus*, the Cloudberry, which is found in elevated situations both in England and Scotland.

COVENT GARDEN MARKET.—JULY 31ST.

Trade quiet. Soft fruit coming light. Prices generally unaltered.

CORN HARVEST.

ALREADY are there indications of the speedy advent of general harvest work. Rye and early Peas are already in stack, the mowing of Talavera Wheat is begun, yellow Trefoil is mown, threshed, and samples of the seed are on the market; much white Clover has also been mown for seed, and winter Oats are fast approaching maturity; but this crop is a week or two later than usual owing to late sowing last autumn. All this work is to be regarded as preliminary, and is not taken into account with the general harvest work.

Turning to the bulk of corn crops, we have promise of a harvest of great abundance. A full corn plant of vigorous growth, full ears, with such plump grain as should tell well both in weight and measure. Calm bright weather while the corn was in flower went far to ensure full ears and plump grain; heavy rain has not been wanting to contribute its part to crop development; the fields are fast becoming "white for harvest," and a month or six weeks of fine weather now will enable us to save a corn crop alike good in quality and quantity. To take full advantage of such weather our preparations must be thorough and complete. No matter how sound reaping machines were after last harvest, it should never be forgotten that when machinery is in almost daily use for a month or two, bearings become worn, joints and connections loosened, to say nothing of the risk of breakage which such locomotive machines incur. If upon examination any blemish is found of a nature at all likely to cause a stoppage or breakdown in harvest it should be at once repaired. Whatever arrangement may be made with the workmen, it is the farmer's affair to do all that is possible to save the corn, and whether he uses self-binders or not, it is for him to help on with the cutting and carting as much as he can. It is unsafe to depend altogether on self-binders, for when corn is beaten down by storms the binder cannot be turned to full account. It is for this reason that we have so far kept to the old reaper and employed men to do the binding. Lodged or beaten-down corn is so often a penalty of high-farming that it has always to be taken into account. With machines in good order, rivets, points or fingers, sections, extra connecting rods, and any other parts specially liable to breakage, at least three sets of knives for each machine, files for sharpening, and plenty of oil, we are ready for the reaping. For clearing, carting, and stacking there must be due provision of forks, hand drag, and horse rakes, waggon ropes, stack, cart, and waggon ladders, straw for thatching, and litter or brushwood for stack bottoms. Cart and waggon wheels should be washed and greased, any faulty gateways, bridges, or crossings repaired, and hedges trimmed where they are at all likely to obstruct the corn waggons.

An extra rick cloth or two are always useful. We do not use the rick poles for corn stacks, but take care always to keep the middle of each stack well filled as the rick is built, both to impart stability, and to ensure rain water running off and not into the stack when a rick cloth has to be used. Stack-building is one of our difficulties. We try to have a handy man on each farm who does this, but the stack builders of our youth are not to be equalled, or even approached, now by any of them. The symmetrical circular stacks, swelling outwards with a gentle curve from bottom to eave, and perfectly erect, are almost a thing of the past. If now our rectangular stacks will only keep upright we are content, but we commend this matter to the especial attention of farm bailiffs, whose care it should be to have neat stack yards and symmetrical corn stacks, provided this can be managed without wasteful expenditure of time and labour.

In letting the harvest some take the horsekeepers into the harvest, others do not allow them to take part in binding or reaping by hand, but give extra pay, and keep them with the horses. This is a matter of expediency, and whatever is done see that the horses are not neglected, and that they have sufficient green food night and morning. With harvest in full swing there must be an odd man—generally too old to undertake a full harvest—to prepare such food for the horses, and to feed them in the morning. The green food used then is either second crop of Clover or mixed layer, or it may be Tares, Sainfoin, or Lucerne. Any of these will answer, so that the horses have full racks of it night and morning, and are not turned out to grass. After the long day's work of harvest enough food should be ready for the horse as we indicate, and it should not have to collect its own food on a pasture when it ought to be at rest. We allow some corn for horses in harvest, but it should be used with discretion, as horses may on some days pick up almost more corn than is good for them, and then green food is an excellent alternative. This is a matter which must not be left to the horse-keeper's judgment, for he will assuredly use corn if he can.

WORK ON THE HOME FARM.

On a heavy land farm more good work is being done between the hay and corn harvest by burning clay taken from the sides of fields and borders of ditches. Spread over the surface and ploughed in it opens up the soil to the action of the air, and also tends to promote quick and regular action of the drains. The heaps are set fire to when only a few cartloads are got together, but by the time they are burnt out they may contain from one to two hundred loads. Hedges are being trimmed so far as time permits, and the trimmings carted to the stacking and in readiness for the corn stacks. Ploughs and harrows have been kept going on foul fallows, and more Mustard and Coleseed has been sown for late feeding or ploughing in.

A large number of lambs are in folds upon Sainfoin, Rye Grass, and Oats. They will go later on to second crops of Clover, and then upon the stubbles. The Oats now being fed off are an inferior crop of spring Oats, so dwarf and thin that they are not worth putting in the harvest. The lambs eat them greedily, they manure the land, and ploughs will follow the folds closely. This field is a mile from the homestead, and we gladly sacrifice the Oats to enrich it sufficiently for sowing down with a green crop next spring. The sowing might perhaps be managed in autumn, but the result is uncertain, and time could hardly be spared for the work then.

An early crop of Peas has been harvested and stacked in good condition, and the land ploughed, so as to be available for late Turnips or a green crop. It is a good rule always to plough land immediately after the crop is cleared when possible, not of necessity to sow another crop at once, but rather to keep under weeds. Land infested with Charlock cannot be stirred too frequently provided it is left long enough between the ploughings for the weed seed to germinate. Stubbles should be left long enough for pigs and sheep to clear off the corn, but this need not take long if only a field is cleared at once, so as to make way for the ploughs to begin as soon as horses or steam power can be spared for the work, such autumn culture going far to ensure success another year.

REMARKS.

21st.—Fair morning; showers from about noon and heavy rain, with some thunder and lightning from 6.20 to 3 P.M.; fine evening.

22nd.—Bright and fresh.

23rd.—Frequent showers all day and heavy rain, with thunder, lightning, and hail from 1.15 to 1.45 P.M.

24th.—Dull all day, with frequent spots of rain; showers at night.

25th.—Dull early; showery after 10 A.M.

26th.—Fine and generally bright throughout the day; heavy rain at 6 and 8 P.M.

27th.—Dull and showery during the morning; bright afternoon; and heavy rain with thunder and lightning 6.33 to 6.46 P.M.; 0.08 inch of rain fell in the three minutes between 6.33 and 6.36 P.M.

The temperature lower than in previous week, and slightly below average. Rainfall excessive.—G. J. SYMONS.

AUGUST WORK IN GARDENS.

AT all times of the year work presses to be done in gardens, and in many cases at no time more severely than during the present month. In not a few instances haymaking seriously interferes with the gardening routine, and much work that ought to have been done amongst flowers, fruit, and vegetables falls in arrear. It is only by extra efforts, where extra help is not afforded, that the arrears can be brought up without prejudice to future crops, before harvest. The ingathering of agricultural grain crops does not affect all gardens and gardeners—perhaps not half of them, as the greater number are situated in the proximity of towns; but there is a large and important margin in country districts where gardens are for a time considerably drained of the labour that is requisite for their maintenance, and for providing not only current but future necessities. No persons except those who have had experience on the subject can appreciate the inconvenience, and something more, arising from the withdrawal of men from gardens during the periods named—haytime and harvest. As a rule gardeners are most willing to afford help in any emergency outside the garden, and they often have to leave work which they know is important undone at the proper time, and the effects of which are not apparent to others till months afterwards, when a blank occurs in the supply, and the original cause is forgotten by all except the victim of circumstances at a critical time. It would be highly encouraging to many industrious, striving, willing men who, or their helpers, are drawn periodically from their regular duties, if a little extra assistance could be given them, when it is apparent they are overpressed, as compensation for the services applied elsewhere, and gardens would be rendered the more immediately enjoyable and ultimately productive by the timely assistance provided under the circumstances. A little extra labour accorded between haytime and harvest has been a boon to many, and there are many more who would rejoice by the consideration of a similar nature and look forward with pleasure to assisting in the ingathering of grain, which they otherwise anticipate with gloomy forebodings.

Gardens are particularly full of "work" this year. Vegetation both of a useful and useless nature has made, and is still making, rapid progress. Where lawns exist they can only be kept smooth by the more than ordinarily frequent action of machines or scythes. Where verges are extensive the shears must be in almost constant requisition to keep them neat and trim; and if not so kept they fail to give satisfaction. Walks and drives that cannot have timely attention become unsightly by weeds, and every day's work given to prevent this may save a week or more of after labour. It is the same with weeds in what is known as cultivated ground, though much that is embraced in that category has not the best claim to the designation. Weeds have gained the ascendancy through, in many instances, circumstances quite beyond the gardener's control, and it will be found true economy to clear them out promptly by a little extra outlay in labour. It may be, and probably is, true that in some cases a gardener may be to blame for the luxuriance of weeds. All men are not alike apt in seizing opportunities, when as much real work may be done in an hour as eventually may take days to accomplish. But by whatever cause gardens become a waste of weeds, it cannot be to the advantage of the owners of the land to permit them to continue.

The remains of exhausted vegetable crops of various kinds are occupying much ground uselessly, and worse, at the present time, for they are depriving the soil of its virtues for no purpose, and the effluvium arising from decaying vegetable is the reverse of conducive to pleasure, not to say health. Much of what is unsightly, and even offensive now, no doubt might have been prevented by pulling Cauliflowers and Lettuces instead of cutting them, and Cabbages also where not wanted for producing a second crop; and even in this case a different method of procedure some weeks ago in cutting and clearing away useless parts at the same time would have saved after labour, and prevented needless soil exhaustion and present unsightliness. But no matter what the cause of the present confusion and waste, the remedy consists in prompt action by a little extra labour, if that at disposal is not equal to the task. The ground thus liberated can now be turned to useful account, but much of it cannot, this season at least, if delay is permitted to occur. There is still time for planting such vegetables as Kale, Broccoli, and even Celery, for winter and spring use, but the time for doing so profitably will soon pass away.

August is the month in which Coleworts can be planted in the certainty that they will be of great service in due season, and a supply of plants should always be in readiness at this season for insertion in vacant ground. Some of the most important crops of the year must also be raised, such as Cabbages, also winter Onions, Spinach, Lettuce, and Cauliflowers; and the position of the man is not to be envied who fails in the supply of these home necessities.

Fruit trees on walls and open quarters need attention, and at no other period of the year can so much good be done by the judicious use of the knife in thinning out useless parts in order that those remaining may become fruitful. The remarks that have appeared in recent issues on the importance of relieving Peach trees of superfluous growths in summer apply, if not quite with equal force, yet to a very important extent to other kinds of trees. The unfruitful nature of many is due to inaction in summer, and the fact is, perhaps, not sufficiently recognised that no kind or amount of work in winter can in any appreciable degree compensate for summer negligence.

Amongst flowers, too, work presses to be done. Those fading require dressing or removal, those advancing require support and attention. A stormy day may destroy the work of a season if that which is necessary for preventing the injury is not provided. Persons who desire the earliest and best displays of hardy annuals, especially such as *Limnanthes*, *Silenes*, *Saponaria*, and others of a hardy nature, cannot produce them so well in any other way as by sowing thinly in firm soil and an open situation during the present month. The propagating season is also with us, and delay in this department may be followed by disaster. Days or weeks cannot be lost at this period of the year without grave inconveniences resulting, and every effort should be made by masters and men to have garden work in August completed well up to time, or it is not possible that the greatest satisfaction can be realised, not only during the present season, but throughout another year.—*EXPERIENTIA DOCET.*

LILIUM HARRISI.

A LATE assistant located in the United States of America brought to my notice the superiority of this variety over the old *L. longiflorum* for pot culture and forcing. When it was first introduced to the public in this country I secured bulbs to give it a trial, but my experience was not very agreeable, in fact I was disappointed, and I was not alone in viewing this variety with suspicion. Now, however, it has exceeded my expectation, and the old *L. longiflorum* cannot be compared to it for pot culture, either for profusion of flowering or for early forcing. Good bulbs, 7 to 9 inches in circumference, can now be obtained at less than double

the cost of *L. longiflorum*, and I can assure those who still have doubts that it is decidedly the cheaper of the two.

It will be clearly seen which of the two is best adapted for early forcing, when it is known that *L. Harrisi* is imported in time to be potted during August, thus having two months good start of *L. longiflorum*. The old form is principally grown and imported from Holland, and cannot be obtained before the end of October. *L. Harrisi* is readily distinguished by its bulbs from *L. longiflorum*, so that there need be no mistakes, as was the case when *L. Harrisi* was first introduced. The bulbs of the latter are flatter than those of *L. longiflorum*, which taper gradually almost to a point. Even the scales of the two are distinct as well as the colour. Imported bulbs of *L. Harrisi* are yellow, very yellow in comparison to those of the old form. The foliage when grown is slightly longer, narrower, and of the two has the least substance. *L. Harrisi* grows considerably taller and produces more flowers on each spike—that is, strong flowering bulbs. The tube of the flower is longer, and the flower possesses a pearly whiteness that distinguishes it from *L. longiflorum*.

The bulbs of *L. Harrisi* are sold by size—namely, 5 to 7 and 7 to 9 inches in circumference. There is a smaller size, but the largest are decidedly the cheapest for forcing in pots. Those who order early always secure the best bulbs, and, therefore, intending cultivators would do well to order what they require at once. This is not only the case with *Liliums* but with all bulbs; the first consignments I have found are always the best. This is not all, the bulbs are much better placed in the soil directly they arrive, and do better than those that are kept out for some time. Those who pot the bulbs early have a decided advantage over those who delay until the autumn has advanced. The one can give them almost natural treatment from the first, and the other resorts to artificial aid and often undue forcing.

The bulbs after arrival should be carefully cleaned. If they have been packed in sawdust, which is frequently the case, it must be carefully shaken out, and all damaged scales removed. It is not necessary to pull away the whole scale if only a portion is injured, the decayed piece can be removed with a knife. The size of pot to be used depends entirely upon circumstances. If the plants are needed for effect in groups the bulbs can be potted singly in 4½-inch pots; two may be placed in 6-inch pots, four in 7-inch pots, and so on. For cutting, or where good sized pots can be used for furnishing, 8 and 9-inch pots may be employed, placing five bulbs in the former and six in the latter. They can be well grown in the smaller pots, but so far, we believe, better in the larger, because a less frequent use of the water pot is required in the early stages of growth. The pots, whichever size is used, must be liberally drained. Press the soil moderately firm, and place the bulbs 2 inches below the surface. The compost may consist of good fibry loam, moderately light, two parts, and the remaining two parts of leaf mould, sand, and decayed manure—one-seventh of the latter will be ample. A little sand may with advantage be laid at the base of each bulb, and the soil should be in an intermediate state for moisture. This is important—it must not be too wet or, on the other hand, too dry to necessitate watering before the commencement of root activity and growth. If the loam is heavy make it light by the addition of more sand, charcoal, or any material that will keep it porous.

The pots containing the bulbs should be placed in a cold frame, and covered over the rims with cocoa-nut fibre refuse, sand or finely sifted ashes; the first, where it can be obtained, is perhaps the best. Mats should be secured over the frame, which should be closed until growth through the fibre is visible. By the aid of mats and fibre the soil about the bulbs remains sufficiently moist to start them into root activity and growth, without having to water them, which would be the case if the pots were simply stood in the frame. Full light must be admitted directly signs of growth through the fibre can be detected. Admit air gradually at first, and increase it considerably as growth advances until abundance can be given on fine days. The plants should be syringed and the frame closed early in the afternoon so as to enclose a little sun heat. It is surprising how rapidly they advance in growth. The fibre can be removed when the growths are 2 inches high, or it can be left on until the pots are removed from the frame.

When the plants have once started into growth care must be taken that they are not checked. Directly it commences to be cold at night remove them to a light airy structure where the temperature will not fall below 55° to 60° at night. On fine days give abundance of air to insure sturdy growth. This is important during the sunless days of autumn and winter. If pushed forward rapidly in a close confined atmosphere they are certain to flower unsatisfactorily. They must be kept growing, but slowly, and then their flowers will form and come forward even if they are brought on a little more quickly. They will bear forcing gently after the buds are formed and display signs of lengthening out.

They must be watered in all stages of growth with the utmost care. If the pots are plunged when the bulbs are first potted it is questionable if any water will be needed before they have made 2 or 3 inches of growth. They should be examined occasionally to see that the soil is not likely to become dry.

Start *Liliums* in the pots in which they are to flower. Nothing is gained by placing them in small pots and shifting them into a larger size afterwards. It is also unwise to only half fill the pots with soil at first; treat them the same as is done when potting any ordinary plant or bulb. This variety certainly roots profusely from the stem, but we have discovered no advantage by the use of rich top-dressings. After the flowers appear liquid manure in a weak state may be given with advantage.

Aphis is the greatest enemy this *Lily* has to contend against. It will quickly cripple the flowers and destroy the plant if not eradicated as it appears. Slight fumigations with tobacco smoke is the best means of destroying the insects, but this must be done directly they can be observed. If they are left for some time they quickly establish themselves in the lead of the plant, and are practically safe from the effects of the smoke. Once they get into this position smoking is useless. The points of the plants should be dipped in a weak solution of tobacco water. The plants will bear this, but the fly cannot.—W. D. L.

THE PAST STRAWBERRY SEASON.

To obtain an estimate of the qualities of the many varieties of Strawberries an extensive plot of ground was planted with about thirty varieties in alternate rows in August and September of last year. We were thus able to compare the varieties with each other, and their behaviour during the season. The first fruit to ripen, on a south border, was *Black Prince*, on June 13th, followed immediately by *Laxton's King* of the *Earlies*, *Vicomtesse H. de Thury*, and *Laxton's Noble*, in the order named, all maiden plants, planted the August previous, mixed indiscriminately for comparing dates of ripening. Then followed *L. Grosse Sucrée*, *Keens' Seedling*, and *Sir Jos. Paxton*, out in the open. June 23rd brought us *President*, *Marguerite*, *James Veitch*, *Pauline* (very inferior), *Sir Harry*, *Captain*, *Alice Maud*, and a score others. The late varieties, *Filbert Pine*, *Eleanor*, *Elton Pine*, and *Wizard of the North*, on the south border, were fifteen days behind *Black Prince*, whilst in open quarters they ripened on July 6th, being twenty-three days after the first berries were gathered. At the present time (end of July) the crop is virtually over, excepting a few small berries on the latest varieties.

One remarkable feature of the year was the absence of May frosts to destroy the "King" or first blossoms, and accordingly *Laxton's Noble* came out prominently with some remarkably handsome fruit which, had there been frost, would never have reached maturity. By the way, what a magnificent quick swelling berry *Noble* produces, yet probably to the detriment of its quality and texture, which can only be described as second class, soft and woolly. It is of handsome shape and good colour, and ripens regularly and speedily.

The drought of June spoilt what promised to be an abundant crop of fruit, and much of it remained small and useless for market work, notwithstanding that the earliest blossoms set fine berries. The rainfall of the month only amounted to 0.54 inch here, and to this deficiency much of the evil is traceable. The varieties that best withstood the drought were *Vicomtesse H. de Thury*, *Keens' Seedling*, *Marguerite*, *James Veitch* and *Dr. Hogg*. Those badly attacked with red spider, consequent on the dry weather, were *British Queen*, *Sir Joseph Paxton*, *Old Pine*, *Filbert Pine*, and *Elton Pine*. Others were also sadly injured.

The largest fruits during the season were obtained from *Sir Joseph Paxton*, and weighed 1½ oz. *Jas. Veitch* had also berries weighing 1½ oz.; *Marguerite*, *Noble*, *Excelsior*, and *Waterloo* each had fruits of 1¼ oz., whilst *Vicomtesse H. de Thury*, *Loxford Hall Seedling*, and several others had berries of 1 oz. each. If it had not been for the drought these weights would have most certainly been exceeded.

Comparing the past season with the previous one of 1888, in which year *Black Prince* was first to ripen on June 25th, just twelve days later, and *Keens' Seedling*, *James Veitch* and others not until July 12th, the late ones coming in on the 31st, and still in fruit on August 15th, we find the season considerably earlier, and on the whole may be taken as more satisfactory, the quality of the berries from *Vicomtesse H. de Thury*, *British Queen*, *Dr. Hogg*, *Sir Joseph Paxton*, *Old Pine*, *Filbert Pine*, and *Waterloo* being far superior to that of 1888.

Just a word in regard to the after treatment of plants. The old custom of cutting off all the leaves as soon as the fruit was all gathered may have much to recommend it when the leaves are

badly infested with spider, as by such means a wholesale clearance of the pest may be effected, and a brisk renewal of healthy growth may make amends for lost time. There is no question, however, where a strong healthy leaf is found, whether this treatment is beneficial or not, as the robust growths of the leaf, always too valuable to lose, are of paramount importance in the production of a mature crown, ready for developing a full crop the following year.—A NORTHERN GROWER.

JOTTINGS.

In the Royal Horticultural Society's Garden at Chiswick several trials of flowers and vegetables have been undertaken this year, and the members of the Floral Committee have paid two or three visits to inspect and analyse these, the results to be embodied in a report to appear in one of the Society's journals. Most unfortunately the funds at command do not apparently permit the prompt publication of these and other matters of interest to the Fellows, who consequently have to wait patiently until the long-looked-for journal arrives, or some individual member gives an outline of what has been done.

IVIES.

One of the meetings dealt with the Ivies, of which a large representative collection has been grown this year, and Mr. Shirley Hibberd, who has long made the Ivy one of his favourite specialties, is now publishing a very useful catalogue of the garden varieties, constituting a really valuable supplement to his admirable monograph issued some years since. The beauty of the numerous varieties of Ivy is not fully appreciated in gardens generally, because comparatively few are widely known; yet many additions to those grown might well be made, especially for garden walls and any bare spaces that cannot be more profitably covered. There are plenty of situations where Ivies thrive capitally, but where it would be useless, or quite unsuitable, to attempt growing fruit trees, and it is dark shaded walls, &c., that are most in need of some covering. All can appreciate the picturesque beauty of any old or stately castellated building covered with Ivy, and I shall not readily forget the effect produced by the noble Ivy-mantled towers of Warwick Castle when seen on a brilliant moonlight night; but even the dull monotony of town and suburban houses or villas can be greatly relieved by a judicious employment of well selected Ivies on the walls. It is true that the common and Veitchian Virginian Creepers are now so extensively planted by reason of their quick growth, that few have the patience to wait while the Ivy is making its much slower progress. Where, however, the greater portion of a house front is devoted to the neat *Ampelopsis Veitchi*, space can always be found at the base for a few of the smaller Ivies, and a pleasing appearance they have, needing but little attention, and of course possessing the one great recommendation of being evergreen.

IVIES FOR SCREENS.—In pots, boxes, and tubs for moveable screens the smaller Ivies are more valued now than formerly, and in many establishments they are almost indispensable for this purpose. At Syon House quite a collection is grown in this manner on screens as diverse in shape as possible, fitting them for a variety of situations in the rooms. For the larger screens, and where a dense effectual block is required, the bold broad-leaved varieties are suitable, and the space is covered quickly, but the small-leaved varieties have the best appearance on a moderate sized screen. The variegated Ivies are also adapted for this method of growing, but they are rather more difficult to colour and manage successfully. The forms of *marginata* are fitted for the purpose, such as *marginata major grandis* and *aurea*, with *chrysophylla*, *discolor*, *sulphurea*, and *madeirensis*, the last named being one of the most beautiful variegated Ivies in cultivation, but somewhat delicate. Of the green forms *gracilis*, *pedata*, *minima*, *deltoidea*, and *triloba* are amongst the best for screens.

ANNUALS FOR TOWNS.

Another interesting and important "trial" at Chiswick was the testing of a large number of annuals in the southern part of the garden, near the Strawberry ground. A considerable space was devoted to them, but they required much more room to have done them full justice, as nothing spoils the effect of these plants so soon as being crowded in the beds. Some of the dwarf growing kinds require massing to produce a good appearance, and when the flowers are small much of their beauty is lost if the plants are not seen in substantial beds; still crowding can always be avoided, and a good deal of seed is wasted by excessive liberality in sowing, the results being less satisfactory alike to purchaser and vendor than when a little more economy is practised. When the seed is sown in pans under glass, as in the case of half-hardy annuals, the transplanting if properly done will avoid all danger of crowding, also in

the case of those sown in beds out of doors, and placed in other positions subsequently. Those, however, sown where they are to remain require to be either allowed sufficient space at first or carefully thinned afterwards. Perhaps it might be questioned whether a trial of annuals at Chiswick could give a reliable indication as to what sorts are best adapted for culture in towns, and all that the Committee could do in the matter was to give one, two, or three marks to the respective varieties, according to their effectiveness and generally known usefulness. The fact is, there are few annuals that cannot be grown during the summer months in town gardens where the smoke and dust are not too abundant, provided the plants be raised elsewhere and transplanted, or at least spring sown. On the other hand, there are few adapted for sowing in the autumn for early spring flowering, although in gardens more favourably situated these give the best results. It is a waste of time and labour to attempt raising plants in the autumn, which have to pass through the trials of a winter in a smoky foggy city like London before they have a chance of flowering, as if they survive they will be miserable weaklings, incapable of giving any satisfactory return for the attention they have received. To supply the townsfolk with plants for their gardens in spring there are numberless growers round the metropolis who furnish the hawkers with stout seedlings in boxes, which are sold at a very moderate rate in the poorer districts of the metropolis. In Covent Garden and other markets large quantities of annuals and other bedding plants are also sold in a similarly small state, the florists and seedsmen providing supplies as well, so that many millions must be disposed of during the spring months.

In suburban gardens outside the smoke radius, or situated in the south and westerly districts, matters are quite different, and there is little difficulty in raising plants, both by autumn and spring sowing, so that a prolonged season is secured. Even in them the collection of annuals is commonly much too restricted, and a few sorts are planted almost exclusively, numbers of really handsome annuals quite as easily managed being unknown. Some time ago one of the leading firms of seedsmen called attention to these plants by a series of exhibits at the Regent's Park Botanic Gardens, but annuals in pots require considerable care to bring them into good condition, and close attention afterwards to retain their beauty even for a short time, and there is only a relatively small number well fitted for pot culture. The exhibits in question were, however, instructive, and many visitors made the acquaintance of charming bright-flowered plants hitherto unknown to them. In the London parks also in recent years some of the useful qualities of the plants have been illustrated by their employment in the mixed beds now in favour; but no trial of the nature of that at Chiswick has been undertaken except in the extensive seed grounds of such firms as Messrs. Sutton, Carter, Veitch, and Webb, at Reading, St. Osyth, Langley, and Kinver, and these have been beyond the reach of the majority of metropolitan visitors. Still few can imagine the attractions of annuals when seen in broad beds of an acre or more, and a hillside or extensive slope of ground mapped out in grand masses of colour has a most imposing effect, reminding one of our heaths and northern hills, golden with Furze or rich with the purple Heather. Flowers in vast expanses like this have a fine appearance, and one can imagine the beauties of some districts in California, where at certain seasons the fugitive attractions of so many annuals and similar plants are displayed in the richest and most diverse profusion. The majority of amateurs can only attempt but a very modest imitation of Nature's extravagance in the floral charms of favoured regions, but many a garden can be rendered gay for several months by a moderate expenditure in seeds of annuals.

POPPIES.

The first plants in the trial grounds at Chiswick which received the attention of the Committee were the Poppies that had been brilliant for some days and were then getting somewhat past their best. This character—i.e., fugaciousness—is the chief defect of the family, and deters many from undertaking their culture; yet brilliant beds of these plants can be added to any garden, and if they do not last very long they are but little trouble, and the plants repay for such slight attention as they require by flowering abundantly. The first group was that devoted to the *Papaver Rhæas* type, all of moderate height, hardy, free, bright, and varied. The wild Poppy of our corn fields is familiar to all, but only within recent years has its capacity for improvement under cultivation been fully recognised. The production of the Shirley Poppies and others of a similar strain was a great advance, and the Rev. W. Wilks performed a good service when he raised and popularised these beautiful varieties. The origin of these Poppies has been repeatedly noticed as due to the crossing of *Papaver Rhæas* and *P. Hookeri*. The latter is, however, simply a geographical variety of the former, if even it be entitled to as much

distinctness, for some urge with good reason that seeds of our common Poppy were probably transported long since to India amongst other seeds, and the differences now observable are due to climatal influence.

Mr. J. G. Baker, however, regarded the Indian plant as distinct and named it *Papaver Hookeri* after its discoverer. The plant was figured in the *Botanical Magazine* December 1st, 1883, and Sir Joseph Hooker thus describes it. "The plant here figured has puzzled me very much. I found it to be common in gardens in India, both native and European, but I know of no native locality for it. Supposing it to have been some well known garden species, and introduced from Europe or elsewhere, no notice was taken of it in the 'Flora Indica' or in the 'Flora of British India.' Specimens are in the Kew Herbarium, collected in the Sahrumpore Gardens by Thomson, in those of Scinde by Stocks, and by myself in those of Bengal. Its nearest ally is obviously *P. Rhæas*, from which it differs in its great size, for it forms a bushy herb 4 feet high and upwards, and in the great number of its stigmatic rays, which are twelve to twenty, that is nearly double those of *P. Rhæas*; the flowers, capsule and seeds are also much larger and the stigma broader in proportion. The flowers attain 3½ inches in diameter and the capsule three-quarters of an inch. The petals vary from pale rose to bright crimson with a white or black spot at the base."

Whether it be regarded as a species, or as a large cultivated form of *P. Rhæas*, this is a most valuable addition to our gardens, being perfectly hardy, and single plants flowering continuously in autumn for several weeks. It was raised from seeds sent by Mr. J. Beck of Kashmir (formerly of Kew) and which were collected by Mr. Dalglish during a journey from Kashmir to Yarkand in Central Asia."

At Kew during the past two seasons a large bed has been devoted to the seedlings of *P. Hookeri*, the seed having been received direct from India, and it has been interesting to note the range of variation both in size and colours. This year a neighbouring bed has been occupied with "Shirley Poppies," and with many points of strong resemblance some differences were also clearly perceptible. For instance, the *Hookeri* varieties had shorter, more globular, smooth capsules, and a less glaucous appearance than the Shirley Poppies, in which the capsule was rather elongated and more narrow, the plants rather stronger, and the glaucousness of stems, leaves, and capsules much more marked. The flowers, too, were rather larger, and light bright shades of colour more abundant. But at Chiswick it was seen that the Shirley Poppies are variable and require some care to maintain their character, as two small beds of seedlings from different sources were very different in merit, one series being much superior to the others. They are all, however, beautiful, and the Committee ranked them with the best of the annuals by giving them three marks.—L. CASTLE.

CELOGYNE CRISTATA.

PLANTS that have been induced to make their growth and flower before the general stock will by this time have well developed pseudo-bulbs, and must be removed from heat to a cooler house. This must be done gradually, and then remove them to the cool house a few weeks hence. When the pseudo-bulbs are developed early in the season considerable care is necessary to prevent their starting into second growth, which they are liable to do, instead of producing their flower spikes. If the plants start a second growth there is little prospect of flowers unless the growths are sacrificed. This is not wise, and the best course is to assist the plants to complete their second growth. If the autumn proves fine, and the pseudo-bulbs are well ripened, a good supply of flowers may follow. After a weak second growth the plants are a season or two, unless they break back, before they make the strong pseudo-bulbs that they previously possessed. The general stock should be syringed freely and watered liberally, but not be hurried in a close, highly heated structure. This treatment results in the pseudo-bulbs forming prematurely and being half the size only that they would attain if brought forward under cooler and more airy treatment.

THUNIA MARSHALLI.

Expose these plants fully to the sun in a cool house to thoroughly harden and ripen their growth. The pseudo-bulbs of plants that are only half ripened are almost certain to decay during the resting

period. Well-ripened growth, a season of complete rest, and then if growth is made under conditions that will insure sturdiness flowers will be certain to come. Water the plants with care; do not allow them to suffer by an insufficient supply until the foliage commences to die naturally.

CYPRIPEDIUM INSIGNE.

Plants that were assisted to make their growth in vinerias, Peach houses, or a warm pit should have lighter, cooler, and more airy treatment. If kept in heat any longer they will come into flower too early to be of real service. They are much more useful for the conservatory, in fact any form of decoration, after November than before. When kept in heat too long the plants are very liable to throw up their flowers irregularly and prematurely. Such cool species as *C. villosum*, *C. verustum*, and others may remain in warm quarters for some time longer; their growth is far from complete. All *Cypripediums* should have abundance of water; in fact, they must not approach dryness during active growth. The syringe may be used freely, provided the water is of the same temperature as the structure in which they are grown. Strong-growing species, such as *insigne* and *villosum*, are benefited by occasional applications of liquid manure in a weak clear state after the pots are full of roots.

MOSS ON THE SURFACE OF ORCHID POTS.

In the cool house the moss on the surface of the pots will be growing luxuriantly. It is useless to keep pressing it down, for it is no sooner done than it needs attention again. Clip it off with a pair of small shears, use it for top-dressing plants that have been potted more recently, or making good the surface of those on which it has not grown so freely. When the best form of sphagnum only is used it does not give much trouble to keep it in order. Unfortunately this is very difficult to obtain. The long, thin, loose variety grows too rapidly and decays too quickly, therefore proving an evil instead of an advantage to the plants.—ORCHID GROWER.

ALLOTMENT GARDENS AT NOTTINGHAM.

THE importance of allotment gardens, and their bearing upon the social well-being of the working classes in encouraging habits of industry, steadiness, and thrift, was seen in a remarkable manner at the Exhibition of the Nottingham (St. Ann's) Amateur Floral and Horticultural Societies, held last week. Large numbers of prizes were offered for the productions from these allotment gardens, and though Nottingham has been famous in the past for the high merit of the artisans' productions, they on this occasion seem to surpass everything that had gone before, and the display was wonderfully good, with few exceptions. It is not my intention to trouble you with any particular details of the Show itself, preferring to give you a brief account of these allotment gardens which I was invited to visit, being assured that the Roses alone, to be seen in what is known as the Hunger Hill Gardens, were well worth being seen. These allotments are owned by the Corporation of Nottingham, and number about 1600; the allotments average from 300 to 500 square yards, and are let at a small yearly rental. But in addition to these there are vast tracts of land, which have recently been divided into allotments, so that in the eastern division of the borough alone there are something like 5000 allotments, all of which are situated in the centre of a district which has long been famous for the successful cultivation of the Rose. My visit afforded me an opportunity of seeing the Nottingham gardens in their prime—or in other words, under the most favourable circumstances, and we could not help feeling that the inducements which they held out for healthy recreation were of the greatest importance. The first we inspected was that of a working mechanic, whom my guide addressed as "Charley," "Honest Charley," a man who had walked between 8000 and 9000 miles between his garden and his house, and who could not tell which had done him the more good—the walk to and from his garden, or the actual gardening in which he exerted himself. He possesses one of the larger sized allotments, about 500 yards, which is wholly devoted to Roses and Tulips, the former of which were very beautiful. A. K. Williams I have never seen in finer form. It has been well shown in this neighbourhood this season, and it is quite evident that those who found it shy and unsatisfactory at first are overcoming the difficulties of its culture. In this garden, as well as most other gardens we visited, Camille Bernardin, Captain Christy, and Charles Lefebvre were in excellent form. A great favourite amongst the artisans of Nottingham is La France, which I found extensively and well grown in the majority of the gardens. Marie Baumann, as a richly coloured variety, was in excellent form, as was also Horace Vernet, Marie-Rady, M. Noman, Merveille de Lyon, Beauty of Waltham, and Marguerite de St. Amand. "Honest Charlie" speaks very highly

of Heinrich Schultheis, and judging by the splendid examples we saw in his garden it possesses qualities that will commend it to Rose growers. This grower prides himself upon having exhibited and taken honours at many leading shows, as well as having supplied from his garden flowers which have graced the hand of the Princess of Wales upon her visit to the town some years ago. In addition to a good collection of Hybrid Perpetuals a snug corner is devoted to Teas, amongst which we noticed fairly good examples of Madame Bravy and Madame Willermoz. "Charlie" has held and carefully tended his allotment for more than twenty years, and well can he unite with the poet in saying—

"We have lived and loved together
Through many a changing year."

Another garden worthy of mention which we next visited was that tenanted by a working bricklayer, who, by-the-by, is ably assisted in its management by his labourer. Roses again were, like the preceding garden, the principal feature, and truly grand examples they were. Several fine blooms of Her Majesty attracted my attention, and in discussing the merits of the Rose with the owner he made a very hearty response to my question, "How do you like it?" by saying "God bless her." A. K. Williams, Alfred Colomb, Etienne Levet, Abel Carrière, and Marie Finger are especial favourites with this knight of the trowel. He grows about 150 trees in seventy varieties, all of which are dwarfs upon their own roots. Roses are not alone in this garden, for there are flats of Stocks, Asters, Phlox, Mignonette, as well as Peas, Beans, Potatoes, Celery, and other vegetables, bush fruits, &c., all of which are in good condition, and which must materially add to the owner's income, and turning what might be happy and comfortable homes already into still more happy and comfortable homes. There are other benefits to be derived in the direction of the elevation of taste and the development of character, and the working classes have got into force a system which will enable them to acquire land of their own, which will increase the means of support of their families.

We have given a brief description of two of these allotment gardens, but there are hundreds, if not thousands more, equally well cultivated within the borough of Nottingham. It is indeed a sight not soon to be forgotten to traverse the miles of narrow avenues of closely clipped hedges, and from some elevated spot view the acres of Roses, for at the time of our visit all Rosedom was out in holiday apparel—white, pink, scarlet, crimson, and yellow, striped and mottled, double and single, in clusters and solitary, Moss Roses, Damask Roses, Noisette, Perpetual, Bourbon, China, Tea, Musk, and all others in exuberant beauty. The air was full of their fragrance. The eye can turn nowhere that is not attracted to glowing masses of Roses. At first one is exhilarated. We wander from garden to garden, and each owner will display his liberality by cutting you his finest specimen. Mr. Arnold Morley, M.P. (who paid a visit to the gardens last week) dons a Souvenir de la Malmaison, whilst the Hon. Finch Hatton preferred a Gloire de Dijon. The air and soil that once nourished Nettles and Thistles, Plantains and Docks, now bring forth Roses with equal kindness, and it was indeed a happy thought when the Nottingham Corporation transformed this large acreage of waste land into allotment gardens; for floral insanity is one of the most charming afflictions to which man is heir. One never wishes to be cured, nor should anyone wish to cure him. We find after the strife, and heat, and toil of our ambitious life, that there is more pure satisfaction in the garden than in all the other pursuits that promise so much of pleasure and yield so little.—J. H. WALKER.

DISEASE OF LILIES.

THIS disease has been known for about twenty years, although it is only during the last ten years that special attention has been directed to it. There are few gardeners or owners of gardens now to whom the disease is not perfectly familiar. Affected plants rapidly and completely perish from the top downwards with a kind of a very wet rot. The white garden Lily (*Lilium candidum*) is most commonly affected, but it is probable that all garden Lilies are liable to attack. *Lilium speciosum* (lancifolium) is frequently destroyed, as are *L. superbum*, *L. calcedonicum*, *L. pardalinum*, and other Lilies. Tulips are affected by an identical disease, so are Humea and Scrophularia. During the first ten years of the known attack of this disease upon Lilies, no fungus or other cause of the disease could be detected; indeed it may be safely said that no fungus capable of causing the disease was present, for the diseased material was constantly under the observation of the late Mr. Berkeley the late Mr. Broome, the writer of this notice, and other observers. Mr. Berkeley was especially anxious to detect some fungus, and once mentioned in print that *Asteroma polygonati* was the possible

cause. In 1881 Mr. Berkeley, however, did detect a fungus upon dying Lilies forwarded to him by Mr. C. Wolley Dod, but even at this time the fungus was so rare that on future examples being forwarded to the writer by Mr. Dod no fungus could be seen, and Mr. Berkeley's examples (now at Kew) had to be re-examined so that the fungus might be studied.

During the last ten years the fungus upon the decayed parts of dying Lilies has been more frequently seen. It is really a very old and well known species, the *Polyactis cana* of Berkeley, and in still older times known as *Botrytis cana*. Mr. Berkeley seems to have been misled by the condition in which he saw the fungus on Mr. Dod's Lilies, for he described it as a new species under the name of *Ovularia elliptica*. The present writer was also misled, for he described it as new under the name of *Peronospora elliptica*. Professor Marshall Ward has described it as a *Botrytis*, evidently new to him, as he has given no specific name. An examination of original examples of *Polyactis cana*, however, shows the fungus of Lilies to really belong to that species.

A reference to the accompanying illustration will show some of the different forms of this fungus, which is transparent, or faintly greyish-white in colour. The figures at A, B, C, and D might well be taken for a species of *Ovularia*. Mr. Berkeley had these forms only in view in 1881. The central slender figure greatly resembles

FIG. 13.—DISEASE OF LILIES.

Its accompanying fungus, *Polyactis cana*, enlarged 200 diameters.

a *Peronospora*, so does the right hand figure. The left hand bottom illustration resembles *Polyactis*, and is typical. The spores seen at G and H are contrary to all the fungi mentioned, and might well belong to *Diplosporium*, in fact some of the examples have been referred to this genus. The above remarks show what uncertainty has prevailed as to the name and nature of the fungus sometimes seen on dying plants.

It may even yet be considered open to doubt as to whether this *Polyactis cana* is really the cause of the disease or a mere occasional accompaniment. Prof. Ward, in a series of laboratory experiments, thinks he has proved the fungus to be the cause of the disease, but this gentleman was unaware of the widespread nature of the disease for ten years before any fungus could be detected. In the original examples at Kew the fungus is only to be seen growing on spots already decayed as is usual with *Polyactis*, and this summer I have seen a second species—viz., *Polyactis vulgaris*, growing upon diseased Lilies in place of *P. cana*, and as far as I know no one has yet suspected *P. vulgaris* of being able to cause disease. *Polyactis vulgaris* is illustrated in the *Journal of Horticulture* for June 28th, 1888, to the same scale as *P. cana* here given; a reference to this back number will show the difference in the size of the spores of the two fungi. *P. vulgaris* is there given as growing upon Tulips affected with a putrescent disease not unlike in effect that of Lilies. Sometimes little black grains, like grains of gunpowder, are found on plants where the different species of *Polyactis* grow, and Prof. Ward has seen them on Lilies, although I have not. Mr. Berkeley recorded the presence of these

rains more than fifty years ago in the "British Flora." Mr. Berkeley saw species of *Polyactis* growing from the grains, the grains themselves being in fact little compacted masses of fungus, spawn, or mycelium.

The effect upon the host plant in the disease of Lilies, Tulips, Humeas, &c., is very like that seen in the "wet rot" of Potatoes. This "wet rot" in Potatoes appears to be caused by a virulent rapid growing micro-fungus named *Bacillus Amylobacter*, which is capable of killing by a powerful ferment.

At the present time it may be open to doubt whether *Polyactis* is really capable of producing disease of any kind in plants, notwithstanding the laboratory experiments of Prof. Ward, especially when the fact is borne in mind that all the bad effects of the disease were well known before any fungus was seen at all.

Some of the practical readers of the *Journal of Horticulture* may justly consider this notice very unpractical, useless, and indefinite; if so they must remember that I can only write of what I know or have seen. I am in a state of uncertainty as to the nature of the disease of Lilies, and I doubt whether any true explanation has yet been given. Remedy there is none, and if the disease is caused by a parasite, it must be borne in mind that parasites prefer to attack the healthiest plants. Parasites do not attack the feeble and dying, but the most robust; they are nourished by the best, not the worst juices of plants. Other forms of wet rot in plants are known to be highly infectious, therefore if any of the putrid remains of diseased Lilies are allowed to remain undestroyed in gardens they will probably spread the disease.—WORTHINGTON C. SMITH, *Dunstable*.

CANKER IN FRUIT TREES—THE INSECT THEORY.

MR. HIAM (page 85) says he is tired of writing on this subject, but when he thought he saw an opportunity of making a point he forgot his fatigue. Agreeably as your correspondent writes, he does not explain how wounds, which he alleges are caused by insects, can at the same time heal with the insects still as busy as ever in their destructive work; nor does he attempt a reply to my question as to where the millions of insects can have gone, which, according to the theory in question, caused the canker in Mr. Tonks' garden. Assuming, for the purpose of argument, they did cause it, which I am unable to admit, how is it that they departed just when he improved and fortified the soil? It would almost seem as if the pest that is said to eat holes in the branches does not like good soil at the roots. He (I mean the insect) must be a funny little fellow, and if ever I get hold of him he shall have the best place if I know it on the best tree I can find.

Mr. Hiam does not attempt to explain how it is that so many trees have been cured of canker without the applications of insecticides. Some are made to produce clean and healthy growth by the action of fresh soil; others by grafting, which stimulates root activity.

When the author of the insect theory is obliged, as he says, to give up the idea that his insects only attack certain sorts they like best he really demolishes his own case, and evidently to his own dissatisfaction.

All we are told fresh about the mysterious insects is that they "do not fly." Probably not; and it is very certain they must be slow walkers or they would step from one tree to another close by; and how they managed to reach the solitary branch cut (and figured) from the Impney tree with no other cankered parts near is a problem still to be solved. If they walked all the way they must have been like their patron, very "tired" indeed.

Mr. Hiam does not admit that frost can injure fruit trees in England because they endure its greater intensity in canker; but we have not the brilliant summers here that harden the wood in Canada and the United States; but even there, if a grower of fruit of many years' standing is not in error the damage sustained by frost is often very serious. Be that as it may, a severe winter has never followed a dull summer in England without cankered branches following, some varieties of Apples, being more tender than others, suffering the more severely. Mr. Hiam might retort that these are exactly the sorts the insects like if he had not cut the ground from under his feet by the above mentioned admission, that they do not attack those they like best.

I am still open to conviction, but since that statement was published I am more than ever convinced that whatever insects your correspondent finds in the wounds on his trees are the consequence and not the cause of the canker.—W.

ADIANTUM CUNEATUM.—Plants that have been yielding fronds for cutting during the past six or seven months should be sorted, for several of them will have discontinued growing. These should be removed to a cool structure, where more air can play about them, for three weeks or a month. This will have the effect of inducing them to rest. The small useless fronds at the base should be removed; in fact, it is a good plan to cut all off and start the plants again into growth in a close, moist, moderately warm structure. Plants subject to this treatment will grow and yield quantities of fronds until the end of the year. Young plants in 4-inch pots may be placed into 6-inch in a temperature of 60°. From November they will supply fronds throughout January and February, the two worst months of the year. Small plants raised

from spores sown early in the year may be pricked into pans, boxes, or singly in thumb pots. Use for these a good proportion of leaf mould to encourage free growth. Afford plants that are growing luxuriantly plenty of room, for if crowded thickly together their fronds are liable to be deformed and useless. Give liberal supplies of water, as if the roots become once dry the fronds suffer.—B.

ROSES IN POTS.

HYBRID Perpetuals that are established in pots for forcing will need attention. Plants that were lifted and placed in 7-inch pots last autumn should be placed into 9-inch at once. The pots should be well and carefully drained and the plants potted without disturbing their roots further than is necessary to remove the old drainage. The soil should be pressed firmly into the pots and the plants plunged in an open sunny position where they can be carefully watered and liberally syringed to keep the foliage free from insects. These plants will make a strong second growth and fill their pots with roots by autumn. Plants that are already in pots 9 or 10 inches in diameter may also be repotted. These should have the drainage removed and the old soil carefully reduced one-third, and larger pots will not be required. The plants should be stood in a shady place for ten days or a fortnight, and syringed during bright weather three or four times daily. This will preserve the foliage in good condition, and root activity will quickly commence. When signs of growth are visible plunge the pots in a sunny place. It is a mistake to delay the potting of Roses that have to be forced until late in the season. When done early they are well established and the pots full of roots before the approach of winter, which is of considerable importance in securing strong growth and fine early flowers. Use for a compost good fibry loam, one-seventh of decayed manure, one 6-inch potful of bonemeal, and the same quantity of soot to each harrowful of compost. If the loam is of a heavy nature render it porous by the addition of sand; if light, reduce dry clay to powder and incorporate it with the loam.

TEA VARIETIES.

Where a house is devoted to the smaller-growing kinds it will be necessary to give them full ventilation day and night. The doors of the structure may also be left open. If the lights can be removed and the plants fully exposed all the better. Mulch the border to prevent the surface drying rapidly. The plants must not suffer by an insufficient supply of water, and the foliage should be kept free from spider by a judicious use of the syringe. Should red spider make its appearance syringe the plants with a solution of sulphur and water. A 3-inch potful of the latter to four gallons of water will be ample. Leave this on the plants for three or four days, then wash the foliage with clean water. Roses in pots may be repotted as advised for H.P.'s. Add in the compost advised for them one-third of leaf mould for the Teas. Encourage such varieties as *Maréchal Niel*, *Gloire de Dijon*, and others to make vigorous growth by feeding them liberally with liquid manure if limited for space at their roots. Keep the shoots tied from the glass as they extend.—B.

TERRA COTTA ROSE.

I SEND you a specimen of my new Rose *Terra Cotta*, a sport from *Anna Ollivier*. It was mentioned by Mr. W. Raillem two years ago, when writing about the Roses at the National Rose Show, about the middle or end of July. The one enclosed is a fair specimen of what they have been for about ten, twelve, or fifteen years, only just one part of a dwarf bush (about a third). The opposite part is always quite the original flower, cream colour. I have about half a dozen huddled on the common Briar. I shall send you one or two blooms off each of those huddled on the common Briar in a few days, then I shall ask you to give your opinion of them in the *Journal of Horticulture*. One of the best qualities is it always takes a few days to open; for a hutton-hole is one of the best, and has always been a great favourite.—H. FOSTER.

[The bud sent was a very pretty one, neat in form, fragrant, and of a distinct shade, fairly well expressed by the name *Terra Cotta*. It is much darker in colour than its parent bloom, which accompanied the specimen of the sport received. The blooms from the Briar are larger and of very good shape.]

ROSE GRAND MOGUL.

As the hedding season is commencing it is as well that we should know whether *Grand Mogul* is to be reckoned a distinct Rose, or to be coupled with *Jean Soupert* in the "too-much-alike" schedule. I myself can see no difference between them, either in flower, leaf, or growth.—DUCKWING.

SOUVENIR D'ELISE ROSE.

As a huttonhole Rose in a small state this variety is excellent, or for bouquets its beautiful form and colour—a delicate pink or a deep blush.

—is always admired. The manner in which it unfolds its petals from the bud is pleasing. This variety generally carries ample foliage, deep green in colour, which very much enhances its appearance. Either in a cut state for exhibition or when growing on the plant, whether it be as a dwarf or cultivated in standard form, this Rose is capital this season.

DWARF ROSES IN SHRUBBERIES.

In no position do dwarf-growing Hybrid Perpetual Roses show to greater advantage than in the front parts of shrubbery borders, especially so when the colours are bright—as for instance John Hopper, Charles Lefebvre, and others of that type. If a good background of greenery be available so much the better, as it tends to show the colours to greater advantage. To have them grown to suit various positions, such as narrow and wide borders, and to preserve a gradation to the front, the plants should be pruned rather differently from the orthodox two or three eyes from the base of last year's pruning. If a greater length of last year's wood be left uncut at pruning time a more abundant supply of blooms will be the result, creating of course a larger show. Take care to prevent the roots of surrounding trees or shrubs encroaching so far as to rob the Roses of support in the shape of manure in the soil and moisture in dry weather. If there is a suspicion of this cut off these roots during the winter by taking out a trench at a distance of 18 inches around the Roses, and at sufficient depth to sever all gross roots.—M.

NOTES ON THE NATIONAL SHOWS.

THE CRYSTAL PALACE.

It seemed pretty clear that northern and late growers would have a good time at the Crystal Palace in this exceptionally early season. I had ripe Tomatoes out of doors on a wooden fence on June 25th, and Alfred Colomb in a blaze on June 22nd on the same plants which were beginning to bloom last year on July 23rd. With me Roses of all kinds were certainly nearly a fortnight earlier than the average. In forecasting the probable winners of the principal events, Messrs. Harkness naturally came into one's mind as likely to regain the professional trophy. And among amateurs it seemed likely that Mr. T. B. Hall, the winner on both occasions of the Jubilee trophy, might have a chance of extending his triumphs. This gentleman, however, to the great regret of his many friends, has retired from the arena; and, failing him, Messrs. Grant and Pemberton, who, by the help of goodly stores of freshly budded plants, are generally able to show well late in the season, seemed to be the most formidable competitors. This would have been a fairly accurate prophecy, Messrs. Harkness among nurserymen, and Grant and Pemberton among amateurs, having it pretty well their own way at the two shows, and sharing the spoils between them. But another Yorkshire firm of nurserymen, Messrs. Mack, are creeping up, have taken a decidedly high position this year, and must not be omitted in our future reckoning; while the rival amateur champions have also a follower who has been rising gradually but surely every year, now treading closely on their heels, and I expect to see Mr. Lindsell enter the lists for the trophy next season.

Exhibitors would generally agree, I think, that you can show pretty well in continued hot weather if your Roses are at their best, and in continued cool weather, though Teas will not be so good if you husband your blooms; that a dull day after several hot ones makes the best possible preparation for cutting; and that a hot day after several cool ones begets disappointment and disgust. This last was the fate of East Anglian growers in preparing for the Crystal Palace. We had four cool, cloudy days in succession, followed by Friday, July 5th, the day before the Show, which was blazing hot, and the result was that in the afternoon there was not a bloom to be found in the proper condition. Some years ago Mr. Baker gave an account (in the "Rosarian's Year-Book," I think) of his successful journey to the distant Norwich Rose Show in 1879. He commenced cutting, he said, at 5.30 (say, I forget the exact times), and finished staging at 7.10. This sounded so delightfully business-like that I have always adopted it, and make a mental note, at least, of the time occupied. But on this occasion a well-known East Anglian amateur who has often done well, told me as we journeyed up together, that he commenced cutting at 5.55, and finished staging at 6 P.M.! He went up with six small Roses only, and, save for the want of a box to show them in, they might have gone in his pocket or his hat, I was almost saying his buttonhole. He is a past master in the art of staging, but I fear that he got no prize whatever, though he has often taken premier honours in Teas. The nakedness of our part of the land was thus shown pretty clearly. I fancy that other parts of England did not have those four cloudy days followed by that hot one; and, indeed, East Anglia did not appear in her strength at the Palace.

Personally, I was much longer in my preparations; it was a terrible job. The whole rosery seemed a mass of colour, yet you might go down whole rows and not find a single bloom in just the right stage—Roses, Roses everywhere, and never a one to cut. Presently there was a cry of alarm from my assistant, waiting for blooms to stage, echoed by two or three small helpers. Casting away my scissors, I had suddenly sat down on the grass in the midst of the Roses, in shirt sleeves and despair, and refused to be comforted. I was lugged up by main force, and pushed all over the weary round again. Many a pendant past bloom was turned up and rejected three or four times over. It was a poor lot indeed, considering that it was the first time I had been "fully out" at the National. And no complacent consultation of the watch signalled the

time of "finished staging." The night was cool in town, and the Roses bore the journey well. We must hold the Shah, or rather the Palace authorities who turned us into a tent, responsible for a little confusion and overcrowding of exhibits. And if Mr. Head did have a *mauvais quart d'heure* he certainly bore it very well. My trebles were "skied" fortunately, as I believe, it was impossible for any judge 8 feet high to have seen them. And I am happily convinced that a closer inspection would have been more likely to have placed them in a lower than a higher position.

It was a capital show in a great many respects, but I am afraid a good many of us were not overwhelmed with delight at the visit of the Persian monarch, whose subjects, I am told, make jam, as well as attar, of Rose petals. We looked upon the being turned out of the Palace itself, the finest site in England for a Rose show, as rather a grievance. We had hoped our new Royal patroness would have had something better than a mere State view of our national Show, and that in a year, too, when Princess of Wales Tea has been, with me at least, better than ever before. And, last but not least, the many-headed crowd of Shah-hunters, which soon swamped the tent, rendered a good view of the exhibits impossible. Indeed, when the big gold-medal policeman (a fine specimen truly, but he did not look like "a distinct sport," or even "a variety not yet in commerce" opened the floodgates and let the torrent in I was glad to flee for some lunch, and any inspection afterwards was hopeless. And I have the greatest respect for the reporter of the Journal who managed, under the circumstances, to give such a good and full account.

My notes of the actual exhibits, &c., must therefore be brief. It was pleasant to see Mr. Prince and his son fixing the gold medal card to the Rose which bears their name, though it was a pity that they again failed to show what really seems to be a worthy Rose in anything like good form. On the other hand I was sorry not to be able to see a familiar picture of former years, the hero of many a tournament of Roses leisurely resuming his coat as the hour struck, while his portly foreman gave the last glances of satisfaction to the Alderney-butter-fed seventy-two. East Anglia was out of it, but lives to fight another day. Of individual blooms the first to catch the eye in Messrs. Harkness' trophy stand was a bloom of Amazone (of all Roses in the world), not grand in shape, but remarkable for size, and very telling in colour. In my hurried tour of the tent I really thought Mr. Lindsell's box of trebles as good a stand as any in the Show. Her Majesty was shown well, the twelves of Mr. G. Paul and Mr. Grant being very fine. It is essentially a Rose for nurserymen and "big battalion" amateurs. Exactly three-fourths of my own plants, cut-backs and maidens, have at present failed to show any sign of bloom whatever.

In Tea Roses Comtesse de Nadaillae was very much to the fore, as it always will be when the earlier Souvenir d'Elise, the queen of show Roses, is over. Two others, Francisca Kruger and Madame Angèle Jacquier, each ten years old, have taken a much higher position in the last two years, and must now be reckoned among the best. Niphotos was very fine, and there was a neat and pretty treble shown of that old torment Monsieur Furtado. I only hope its exhibition will not tempt any confiding amateur to try and grow it.—W. R. RAILLEM.

CLOVE CARNATION PAUL ENGLEHEART.

I SEND you a bunch of the bedding Clove Carnation Paul Engleheart, which I have been distributing for the past two seasons. It is what it professes to be, a first-rate border plant, especially valuable for massing, and, as you will see, the stems are so sturdy that they are able to support the fine head of flowers without stakes. Those sent are cut from last season's layers, the plants being less than a year old; but the second season we reckon to be the best for this particular variety, when the clumps are grand with some two hundred flowers open at once on each. Autumn planting seems to be absolutely necessary to its well-being, as layers kept in pots during the winter are not to be compared with those planted out in October, a fact which should be noted in its cultivation. I may add that this border Carnation is beginning to attract attention in the U.S.A. A favourable criticism has appeared in the *American Garden and Forest*, July 10th.—GILBERT DAVIDSON.

[The trusses and blooms of this crimson Clove Carnation are the finest we have seen. On one stem there are five expanded blooms, each 3 inches in diameter, on footstalks so strong that there is not the slightest tendency of the flowers to "hang down their heads." Some of the petals exceed 1½ inch in diameter. This variety has been advertised in this journal, and wherever such examples are grown as those before us they would be an ornament to any garden, and, we think, bound to give satisfaction to admirers of hardy border flowers.]

MANURING FIG TREES.—Occasionally trees are met with that would be benefited by an annual top-dressing of fresh loam, manure, chemical or solid, and chalk or lime rubbish, this serving to keep the roots active near the surface without causing an unfruitful growth. Prior to applying this top-dressing the surface soil should be forked away from the roots, and either returned on the top of the fresh compost or wheeled away altogether. A mulching of strawy manure ought also to be given in addition to the top-dressing, as it is very certain heavily cropped trees with their roots in a much impoverished border will not

produce fruit of the best quality. The least that can be done to productive old trees located in a hot and dry corner is to loosen the soil about their roots and heavily mulch with good solid manure, strawy litter spread over this serving to keep it always moist. Liquid manure may also be safely given to these comparatively stunted trees both now and during the summer; but, if it is repeated, on no account should any trees already too vigorous to be profitable receive either top-dressings, manure solid or liquid. A surfacing of leaf soil would serve to attract and keep the roots near the surface, this tending to cause sturdy rather than gross unfruitful top growth.—W. I.

EVENTS OF THE WEEK.—The National Chrysanthemum Society's annual excursion will take place on Monday next, August 12th, Hatfield and Knebworth Gardens being the places selected this year. Full particulars as to trains, &c., will be found in another paragraph. The Royal Horticultural Society's Fruit and Floral Committees will meet in the Drill Hall, James Street, Westminster, on Tuesday, August 13th, at 11 A.M. On Thursday, August 15th, the annual Exhibition will be held at Maidenhead. A sale of Orchids and other plants will be held at Sorbie, Tunbridge Wells, on August 14th, by Messrs. Brackett & Son.

FELLOWS OF THE ROYAL HORTICULTURAL SOCIETY.—From a list before us of Fellows elected during the last four months we find the number as follows:—April, thirty-six; May, twenty-five; June, twenty-two; and July, sixteen, with one associate, making exactly one hundred during the period in question.

ROLLISSON'S TELEGRAPH CUCUMBER.—Mr. George Bunyard sends us a brace of fruit representing what he calls the Maidstone strain of this variety. They are 20 inches long, straight, uniform in thickness, and excellent. They were cut from plants that have been bearing for two months.

PETROLEUM FOR DESTROYING WASPS' NESTS.—As a destroyer of the insect enemies of the garden no other substance perhaps has gained such popularity as petroleum; but until this year we never tried it for the above purpose. A wasps' nest was discovered in a very inaccessible place in the wall of an outhouse, where most other remedies could not be applied with safety. After some consideration the effect of syringing petroleum into it was tried, with the gratifying result that all the inmates were killed, and since then whenever a nest is discovered a small quantity has been poured into it at dusk, producing the same deadly consequences. Its cleanliness and effectiveness has caused us to discard all other destroyers in its favour.—M.D.

MR. W. HOLMES writes:—"In response to very many inquiries I have pleasure in announcing that the accustomed summer meeting of members and friends of the NATIONAL CHRYSANTHEMUM SOCIETY will this year be held on Monday, August 12th. I have received permission from Lord Salisbury, and also from Lord Lytton, to visit their respective gardens and parks at Hatfield and Knebworth, and I have very little doubt that given fine weather a most enjoyable outing may be anticipated. The Great Northern Railway Company have very considerably reduced their ordinary fares for this occasion, and I have arranged with the proprietor of the Lytton Arms Hotel for refreshments. The cost, inclusive of railway fares, dinner and tea, will be 7s. each. Arrangements.—10.15 (sharp), the party will assemble at King's Cross main line, local platform; 11.17, arrive at Hatfield, five minutes' walk to Hatfield House gardens, inspection of gardens and park, &c.; 2 o'clock, re-assemble at Hatfield Station; 2.17, arrive at Knebworth station and walk to Lytton arms; 2.45, dinner, and afterwards walk to Knebworth House, inspection of gardens and park, &c.; 7.30, tea at Lytton arms; 8.59, Knebworth station; 9.55, arrive at King's Cross. N.B.—A train also leaves Knebworth at 6.55 P.M., and arrives at King's Cross at 7.48 P.M."

IMPROVING GRAVELLY SOILS.—It was a great pleasure to see a letter again in our Journal from that veteran horticulturist "Upwards and Onwards." In that letter he writes of having to deal with a gravelly soil at Woodstock, and as I have the like—viz., a shallow gravelly soil resting on a bed of gravel, I should be glad to know how he

dealt with that soil, so as to bring it into a high state of fertility, and how he managed to grow such crops as Peas and summer Cauliflowers. Practical information on this point such as he has given on Strawberries would no doubt be of great value to many.—H. C. R.

—"M. C." writes:—"I recently had an opportunity of inspecting a very fine crop of Tomatoes in the gardens at HAM GREEN, BRISTOL. The variety grown is exclusively that known as Ham Green Favourite, and as far as I could judge of its merits it should soon become a favourite in every establishment where medium-sized, solid, and smooth fruits are required in quantity. In one house some twenty-five plants trained on the single stem system presented a remarkable appearance; racemes of fruit as long as one's arm depended at short intervals from the abnormally stout stems, bearing on an average from ten to twelve fruits of from 2 to 3 inches in diameter, perfectly smooth, and of a bright coral red. On one raceme I counted the almost incredible number of seventeen fruits all of good size and shape. What the aggregate weight of the crop is I should not venture to state, but if anyone should desire to see Tomatoes growing as they are sometimes figured in seedsmen's catalogues, they should not fail to pay a visit to Ham Green.

—"In another house without artificial heat the crop was equally fine, though somewhat later, the long strings of fruits showing its freedom in setting by swelling off the fruit to the extreme tips of the racemes. Mr. Crocker is to be complimented on his acquisition of such an apparently valuable variety; also in the production of such a magnificent crop of fruit, as undoubtedly the skill that is brought to bear on their cultivation materially adds to such successful results.

—"SOME GRAPES of more than ordinary quality were also worthy of note, a fine crop of Muscats in one division of a range of fruit houses being especially good, while in the late house some bunches of Lady Downe's were of exceptional size and promise. Good crops of Peaches and Nectarines in other divisions were being gathered, and some large healthy specimen Ferns in another house, with a small but select collection of stove plants, all in clean and vigorous condition, completed the range of fruit and plant houses.

—"IN the open ground CHRYSANTHEMUMS were represented by fine healthy plants, with leaves down to the rims of the pot, evincing the skill exercised in their culture, and an opinion expressed that something more than average quality bloom should reward the labour bestowed on them met with a cordial invitation to 'come and see' in due time, a kindness which I shall not fail to take advantage of. A batch of Tuberous Begonias in cold frames were worthy of inspection, fine massive flowers and strong healthy foliage showing plainly that they were happy under the treatment accorded them.

—"CROPS in the KITCHEN GARDEN were of good uniform quality, 'deep cultivation and adequate manuring' being Mr. Crocker's motto in this department. Some beds of double white Stocks, Princess Alice (Veitch's strain) were of superior quality, as were also other beds of Empress White Asters. These were but a few of the many objects of interest in these well-kept gardens over which Mr. Crocker so ably presides.—M. C."

—"GARDENING APPOINTMENT.—Mr. R. Russell, late foreman at Shelton Abbey, Co. Wicklow, has been appointed head gardener to the Earl of Mayo, Palmerstown, Co. Kildare.

—"BULB SHOW AT HAARLEM in 1890.—The General Royal Union for the cultivation of flower roots at Haarlem has sent to its members the schedule of prizes for the sixteenth flower show of that society. This will be the fourth large exhibition to be held at Haarlem. Such shows are opened every five years on the same system as the large exhibitions at Ghent (Belgium) take place. The last of the Haarlem shows was in 1885, and then the collections of Hyacinths, Tulips, and other bulbous plants doubtless were as numerous and as good as ever were seen at any other exhibition. The next show promises to be a similar attraction. Not less than 253 prizes, consisting of gold, gilt, silver, and bronze medals are offered in 105 classes for Hyacinths, Tulips, Narcissus, Crocus, Amaryllis, and miscellaneous bulbs and roots, as well as for bouquets, &c., consisting of flowers of the same class of plants. The show is merely arranged to promote the bulb cultivation of Haarlem, and from this special point of view is certainly not to be surpassed. It will be of great interest to foreign horticulturists to pay a visit to Haarlem in the days the show is opened, which will be from March 21st to 25th, 1890. For particulars, information can be had from the General Secretary Mr. D. Bakker, Gedempte, Oude Gracht No. 110, Haarlem, Holland.

— **SUSSEX RAINFALL.**—The rainfall registered at Borde Hill, Cuckfield, during July was 3.75 inches, being 1.21 inch above the average. The heaviest fall was 0.85 inch, on 23rd, rain falling on fifteen days. The highest temperature (not strictly speaking shade temperature) was 90° on the 6th, the lowest 47° on the 20th. Mean day temperature 77.1, mean night temperature 52.1°, mean temperature 64.6°—exactly the average of the past seven years in the same position.—R. INGLIS.

— **YOUR correspondent "J. R. S. C.,"** under "Notes and Gleanings," issue August 1st, cautions his English friends against following the example of the Americans in the use of PARIS GREEN AS AN INSECTICIDE. In an article to the Journal on this subject I mentioned the use of arsenic in California in combatting the codlin moth larvæ; but as it is used in the proportion of about 1 lb. to 200 gallons of water, and sprayed on the trees (Apple and Pear) as soon as the blossom has fallen, it would seem reasonable to suppose that no poison could remain by the time the fruit has matured, as no more than one drop of this solution could remain on the embryo Apple. But as we do not resort to any such measures on mere supposition, we have the word of such eminent scientists as Prof. E. W. Hilgard of the State University of California, that no possible trace of poison remains. This has been practised also for many years in the Eastern States, as is found to be the most successful remedy for this particular pest.—LEONARD COATES, *Henley-on-Thames*.

— **ECKFORD'S NEW SWEET PEAS.**—All lovers of our hardy garden flowers will find in Mr. Eckford's grand new varieties of Sweet Peas something worth having in their gardens. Mr. Eckford, now of Wem, Salop, for years past has been hard at work hybridising and improving the ordinary garden Sweet Pea, and for a few years past has, through the medium of the seedsmen of the country, been giving us new varieties. He was asked to send blooms of a few varieties to the Solihull Flower Show on the 24th July, to give the Midland people an opportunity of seeing what is being done with this favourite garden flower. A dozen varieties in bunches were sent—viz., Captain of the Blues, a very fine variety; Primrose, Princess of Wales, Boreatton, Cardinal, very rich in colour; Isa Eckford, Queen of England, Apple Blossom, Miss Hunt, Purple Prince, Splendour, and Mrs. Gladstone. All these are very fine varieties, and surprised and greatly pleased the large number of visitors at the show. There can be no question as to their great beauty, and as Sweet Peas are so easily cultivated and seed easily saved, Eckford's new Sweet Peas ought to be in every garden.—D.

— **POTATO DISEASE.**—The warm, showery weather we have been having during the past fortnight has already caused the disease to appear. I first noticed it in a quarter of kidney Potatoes on July 26th. It was then very slight; but now there is not a garden or field of Potatoes in the neighbourhood but what is injured, in fact one may scent it a hundred yards distant when walking along the roads. So far I have not yet seen a diseased tuber, but the probability is that ere long we shall have a different tale to tell. The Potatoes were looking remarkably well up to a few days ago; all varieties are, however, later than usual, owing no doubt to the cold spring. Previous to the disease setting in the haulm of even the Ashleafs was as green as ever, and the skins were not set. I remember, two years ago some writer expressing the opinion that the disease had died out, little or no appearance of it being visible that year. Judging from present appearances the writer will get a somewhat rude awakening this year from the premature conclusions then arrived at.—LIMERICK.

— **RED SPIDER.**—I cannot allow that interesting and instructive article from your correspondent Mr. G. Abbey (page 92) on red spider to pass without a brief reference. In the first place Mr. Abbey, I think, is entitled to many thanks from both practical and other gardeners, for so ably putting before your readers his valuable information on this subject. No doubt a dry atmosphere principally causes the appearance of red spider; also if plants are allowed to get dry at the roots it has a similar effect. There is also some truth in the assertion of some writers respecting insect pests attacking principally our unhealthy plants, for it is in such an atmosphere as your correspondent describes that unhealthy plants are to be found. They cannot be otherwise in a house insufficiently ventilated. And again, such checks as a too high and a too low temperature are at all times to be avoided if we are to keep our plants in a healthy condition and free from insect pests. I have thirteen houses in these gardens under my charge, both fruit and plant houses, and I can always keep red spider at bay by the use of the syringe and the garden engine, with the assistance of sulphur and linseed oil made

into a paint, about the consistency of ordinary paint, and applied to the hot-water pipes every spring.—ALFRED BISHOP, *The Gardens, Westley Hall, Bury St. Edmunds*.

— **PINE TREES LOSING THEIR FOLIAGE.**—We have some remarkably fine specimens of *Pinus Menziesi*, and during the month of April the entire foliage from foot to summit turned brown and fell off; not a solitary needle was left on any of them. Some of the trees are on very high ground, but sheltered by other trees; others are planted at the same elevation and quite exposed, while more are planted on low, sheltered ground. They were all alike, 60 feet and upwards in height as brown and as bare as a Larch in January. It was the middle of June before any of the trees recommenced growth. I had begun to think they would die, and it is now several inches in length. Of course all the centre of the trees are as bare as can be, rendering them very unsightly features here. Can anyone suggest a probable cause for this strange behaviour? Some of the trees are growing on shallow, sandy loam resting on sandstone; in some places the subsoil is gravel; others are growing in peaty soil—in fact, in an exhausted bog. There is no lime in the soil. Some of the trees are as much as four miles apart.—HANDY ANDY.

— **THE issue of the *Botanical Magazine* for July** contains coloured illustrations of the following plants. T. 7063, *Pandanus labyrinthicus*, a Screw Pine long cultivated at Kew under the name of *P. ceramicus*. It is a native of Sumatra and other Malayan islands. T. 7064, *Syringa villosa*, a native of Chikli, province of China, on mountains near Pekin, where it was discovered by D'Incarville before 1740, recently collected and seeds sent to Kew by Dr. Bretschneider. The plants first flowered in May, 1888. The leaves are small, ovate, and the flowers pale rosy lilac. T. 7065, *Olearia macrodonta*, a New Zealand "Daisy Tree," with hard corymbs of small white flower heads, each having a reddish centre. Flowered in Mr. W. E. Gumbleton's garden, Belgrave, Cork, on a south wall, June 1883, where it stood without protection for three years. T. 7066, *Disa lacera* var. *multifida*, a Cape of Good Hope Orchid with blue flowers, figured in the *Journal of Horticulture*, p. 221, 1888. T. 7067, *Eucryphia pinnatifolia*, a native of Chili, "confined to the Cordillera of Concepcion, where it forms a bushy tree 10 feet high, and is called Nirrhe." Introduced by Messrs. Veitch & Sons, and found to be hardy. The flowers are large, comprising four broad white petals and numerous stamens, the leaves pinnate and bright shining green.

COLCHICUMS.

It seems a little unseasonable, and a little unwelcome, to think and speak, in the height of summer, of late autumn flowers, but in gardening it is necessary to "take thought for the morrow," and it will, I hope, be sufficient apology for these notes to state that late in July is probably the best time to purchase and plant roots of the Colchicums (Meadow Saffrons or Autumn Crocuses as they are frequently called). These two latter names are far from being correct, and however they may be sanctioned by long habit are only misleading to the inexperienced and unwary. The true Meadow Saffron is a *Crocus*, *C. sativus*, which was at one time largely cultivated at Saffron Walden for its styles, which yielded the saffron of commerce. As for autumn Crocuses, properly so called, there are many species well worthy of cultivation, and no one who has seen the root of a Colchicum will admit its title to the name of *Crocus*. The Colchicums have been placed in the natural order Melanthaceæ, while the Crocuses belong to the Iridaceæ; but a small number of species are commonly grown in gardens, the great similarity in general appearance possibly preventing the general introduction of many species. The Dutch growers catalogue more species and varieties than our bulb dealers, and many of these have sufficient dissimilarity to make them valuable to the collector of hardy plants who seeks to bridge the quickly narrowing gulf between autumn and spring flowers.

The best known species in our gardens is *C. autumnale*, a native, flowering in September or October, as do most of the Colchicums. There are several varieties of this species, and but little difference in the various shades of lilac, rose, or purple among the singles, but the single white is a desirable plant, and the double variety almost deserves a column to itself. The double *C. autumnale* in my garden I should call lilac, and it is so called in most English lists. Some of the Dutch growers, however, catalogue two varieties—a double purple and a double rose—and which of these is the lilac it would be hard to say. Whatever its real colour it is a most desirable plant to grow, and far superior, with its perfectly double blooms, to the single form, one great merit being its longer period of bloom. The double white is still better,

and has only one great fault; the price places it beyond the reach of many of us, unless at the sacrifice of other plants. It is quoted at from 2s. 6d. to 6s., and the amateur is apt to pause and reflect upon the many bulbs he could buy for even 2s. 6d. before investing in the grand double white Colchicum.

Another neat flower is *C. variegatum*, which is dwarfier than *C. autumnale*, and is beautifully chequered with rose, purple, and white. It is a native of the Levant, and was, I understand, introduced about 1629.

A still more desirable species is *C. byzantinum*, said to have been introduced from Constantinople about the same time. It has handsome soft lilac mauve flowers and broad leaves, which, like those of the other Colchicums, do not appear till spring. There is, I believe, a fine double form of this and a variety with variegated leaves, the latter very rare; but I have not met with either of them.

The largest of the single-flowered species is known as *C. speciosum*, which has rich rose coloured flowers, and the best variety, which is difficult to obtain true, is known as *C. speciosum rubrum*, and has reddish stems. It is still comparatively expensive, although much cheaper than *C. autumnale album plenum*. There are at least ten other autumn-flowering Colchicums in commerce, but I am not sufficiently acquainted with their merits to venture any remarks upon them. The genus is not exhausted, however, as there are two spring species in commerce, a new *C. luteum*, yellow, as its name denotes, which I have not yet seen, and another, *C. crociflorum*, which has been in cultivation for a long time, but is not often met with. That in my garden is white internally with blackish purple base, and the greater part of the exterior petals of the same colour edged with white. When it has been well established and increased to some extent it will have a good appearance. There is, however, such a wealth of colour among the Crocuses in spring that a good stock of the autumn Colchicums should be secured before venturing upon the spring species.

It is unnecessary to give details as to the culture of such easily grown plants. They should be purchased as soon as they can be had from the dealers and planted 3 or 4 inches deep in fairly good soil. If secured early they will bloom well the same autumn, and, increasing from year to year, will form good clumps, giving the owner and all observers much pleasure in the late autumn days, when the leaves are falling and Nature is fast assuming her winter garb. Let me add an expression of opinion that the Colchicums will give most satisfaction if carpeted with some plant which will give the flowers the natural support afforded by surrounding vegetation in their native habitats, but which would not be injured by their luxuriant leaves in spring.—S. ARNOTT, *Rosedene, Kirkbean, N.B.*

SEASONABLE HINTS ON FLORISTS' FLOWERS.

As I have more than once intimated, I do not pretend in these notes to do more than refer to the work that I find necessary in my own garden, that I do not grow flowers for exhibition, and that my collections are really selections, and limited, therefore, in the number of the varieties grown. There are some persons who grow one, or at most two kinds of florists' flowers, and they are consequently able to look after and manage a large collection, but with me the ease is different. I like to have a succession of flowers, and so begin in the spring with Auriculas, then following with Pansies, Ranunculus, Roses, Carnations and Picotees, Gladioli, and ending with Chrysanthemums. I attain my object, it may be at the expense of completeness in any of them, but with the increase of pleasure to myself. I have not yet fallen into the practice of counting all flowers that are grown in collections—Fuchsias, Cinerarias, Pentstemons, &c.—as florists' flowers, and, with the exception of the Rose, adhere to those what were so regarded by the older florists, although they would have been puzzled to give a definition of them, or why they admitted them and excluded others.

AURICULAS.—I believe, on the whole, that it has been a favourable season so far for these flowers. We have had no intense July heat, the thermometer here in Kent has never gone into the eighties, and a cool July is favourable to the Auricula. They will soon, as the weather seems as if was coming warmer, require more attention as to watering. All dead or decaying leaves should be removed, weeds should be pulled up, and the surface of the soil gently stirred. If the woolly aphid is observed round the neck or collar of the plant, it is well to remove it, but otherwise we need not trouble ourselves about it, for I think more experience has convinced us that we were wrong in attributing to it such destructive powers, although there was a good deal to be said on the *prima facie* view of the ease, that a beast that apparently lived on the juices of the roots could not be otherwise than destructive. As to autumn blooming, I believe it to be very much a question of varieties, some being more apt to do it than others, but nothing must be done to encourage it, and the frames should be kept as open as possible and shaded from the sun.

CARNATIONS AND PICOTEES.—Now is the time when the important

operation of layering will have to be carried out, and where the collection is large it will absorb a good deal of time; where it is small, as in my own case, it can be taken more leisurely. The first thing to be done is to go through the plants and see what have run—i.e., lost their character and become selfs, the stripe having run into the white and so spoiled the flower. These should be either cut away or pulled up, unless, as in some cases, they have become very bright selfs, when they may be reserved for the border, but carefully marked so as not to reproduce them again in the collection. The cause of this seems still to be a mystery. It is more common amongst Carnations than Picotees, and as its cause is unknown no remedy can be proposed. A supply of pegs for layering should be procured, and where Brake abounds there is nothing so good. They are firm, and yet generally decay by the time the layer is fit to be taken off. The compost for layering them in should now also be got ready; loam, leaf mould, and some road grit forms an excellent one. It must be light and open, so that the young rootlets may speedily make their way into it, whilst it must have sufficient consistency not to be washed away in the process of watering. It is now that one great advantage of growing them in pots is realised. The pot can be placed on a bank on a level with the operator, and thus all stooping is avoided. The operation of layering is a very simple one, but like a good many simple things is not easily explained without the use of illustrations; but as the possession of a collection implies almost the knowledge how to layer, it will be unnecessary to explain it, and, indeed, its success depends more, perhaps, on other things than on the layering itself. Thus it is necessary before commencing to see that the earth in the pot is thoroughly wet, or the plants will suffer, as gentle watering will be the rule afterwards. We must also be assured as to the condition of the shoots to be layered, for if they are not sufficiently hard the cut joint will probably rot, and so the layer be lost, and if too hard the probability is that it will not send forth any roots, but the joint will simply barden and so be useless. The old soil in the pot should be removed to about an inch in depth, and the fresh compost put in its place unless the soil has sunk a good deal, when it will be only necessary to stir the surface. This is one of the few cases in which I ever allow a sieve to be used, but it is admirable in this, and the soil before being used for layering may be, nay, ought to be, passed through one. After layering the soil should be watered with a fine rose, and the pots sheltered for a little while from heavy rain, but in a week or ten days they may be placed where they will be fully exposed to the weather.

GLADIOLI.—This is the month which is to reward the grower for all his pains, or perhaps to give him sore disappointment. A good deal depends, of course, on the weather; but I think there is little doubt that a dry and warm August, which for so many reasons we hope to have, is more favourable to them than the wet cold season we had last year. I find they are showing at what I believe to be their normal time, thus some of the earlier flowering varieties are making their appearance. Shakespeare was in bloom on July 28th; Nereide, Pasteur, and others, which are marked A on Vilmorin's catalogue as the first to flower, are opening, and I imagine the season will be at least three weeks earlier than last year. Those growers who care to have their flowers in perfection will be careful to stake each as it advances into bloom. The spikes come in so many different ways that it is well to see what direction it is about to take before staking. The stems should be tied in two or three places, and loose enough to allow room for the stem, but not so loose as to endanger its being snapped across. Should the weather be very hot and dry watering must be resorted to, and when done the heds should have a thorough watering, as small applications are of little use. There is but little chance of seeing any of these fine flowers at exhibitions until next month, and by that time I imagine the best blooms in or near the metropolis will be over; but when "everybody is out of town" it is useless attempting a flower show, and London has been so used up this season that it would require a great deal to arouse it; but wherever notes can be taken there the grower should be ready to watch for new new flowers, or old ones which he has perhaps missed. It ought to be a good season for saving seed, and where this is desired the stems should be left tied to the stakes; but where there is no wish to save seed they ought to be removed as soon as the bloom is over.

PANSIES.—The small collection I have of these is now planted out in a shady part of my garden, where they for the present simply require to be kept free from weeds, and to be watered when the weather is dry.

ROSES.—After the first bloom is over it is too much the fashion to leave Roses to themselves, but this is unwise; good blooms may yet be had from this year's shoots, where disbudding must be as carefully practised now as in the earlier part of the season. Another point often neglected—viz., tying out the newly formed shoots, so as to let all the air and light possible into the trees. Where mildew has appeared, sulphide of potassium will be found the most useful preparation, but I do not think that at this stage of their growth mildew permanently injures the plant, although it very much disfigures it. Waterings with liquid manure are now very useful, and if Roses were better treated at this season of the year I am inclined to think they would pay for it next season. There is every prospect of a good autumnal bloom amongst the Teas, which thus doubly earn gratitude from Rose growers.

I add nothing on the culture of Chrysanthemums at this very important season of their growth, for they are largely discoursed upon in the Journal by able growers. My collection, which is grown for our own pleasure, looks exceedingly well, with capital healthy foliage. Tulips and Ranunculus are now reposing quietly in their respective

drawers and boxes, so that they require no attention, and no observations in these notes on florists' flowers.—D., Deal.

THE REV. M. J. BERKELEY, F.R.S.

THE announcement of the death of our revered friend Mr. Berkeley just as we were going to press last week gave us no time to furnish a portrait of him; but we have now the pleasure of presenting one which represents him as he was in recent years while still in the possession of those intellectual powers for which he was eminently distinguished.

themselves into a committee to secure a painted portrait, to be presented to the Linnean Society. The appeal for subscriptions to the scientific world was quickly responded to, and a very excellent portrait, painted by Mr. J. T. Peele, was the result. The presentation to the Society was made in the name of the subscribers by Sir Joseph Hooker, and a replica was painted for Mr. Berkeley's family.

Mr. Berkeley was buried in the churchyard of Sibbertoft on Saturday last, the 3rd inst.

ALL who have known the late Rev. M. J. Berkeley, or have seen any

FIG. 14.—THE REV. M. J. BERKELEY.

The portrait is from the pencil of Mr. Worthington G. Smith, the talented botanical artist and faithful follower of Mr. Berkeley in fungological investigations; and we may well believe that the sympathetic spirit, as well as the genius of the artist, combined in producing a portrait which so faithfully recalls the noble features of one of our most distinguished, as he was one of the most modest, of our scientific men.

A few years ago some of Mr. Berkeley's personal friends formed

of his writings, would read the news of his death in last week's issue with unfeigned regret. It has been my privilege during the last ten or twelve years to have spent many a pleasant hour on several occasions in his company, in walking and admiring plants and trees that were known to him thirty years or more previously, and he would point out the progress made in many of them, notably Coniferous trees, many of which he remembered when planted, and had watched their progress, till they have now made handsome specimens from 50 to 70 feet in height.

Writing as a gardener, one could not be in his company for long before finding that he possessed a great knowledge of fruits, flowers, and vegetables, and his vast intellect and kindly tongue were ever ready to impart useful information. It mattered not whether it was Grapes, Melons, Peaches, Plums, Apples, Pears, with Potatoes and all other vegetables—herbaceous and alpine plants, trees, shrubs, and forest trees—he was always well informed respecting the merits and defects of the latest introductions and novelties; he could also speak of the long list of good old varieties of fruits, flowers, and vegetables that had come under his notice during sixty years. His memory also was marvellous, and when last I had the pleasure and privilege of a walk round the gardens here with him a few years ago, then in his eighty-third year, it was astonishing how ready he was in giving the names of common British plants that I wished to know. Few men I have seen at that age with such a quick and correct memory.

Mr. Berkeley was frequently seen at the shows of the Royal Horticultural Society at Kensington twelve to sixteen years ago, and many gardeners that have seen his patriarchal and noble countenance there on several occasions would never forget him. These notes are penned by one who was a great admirer of, and who has met with many acts of kindness from the deceased gentleman, and who feels greatly indebted to him for much useful knowledge.—A. HARDING, *Orton Hall Gardens, Peterborough.*

A CATALOGUE OF GARDEN IVIES.

[We have been favoured by Mr. Shirley Hibberd with the following notes on Garden Ivies.]

(Concluded from page 88.)

VARIEGATED FORMS OF HEDERA HELIX.

31. MARGINATA is the general name of some half-dozen or more distinct varieties with variegated leaves. Great confusion prevails in the garden names of these, such labels as are commonly seen being worse than useless, because they are attached to the plants on something like the principle of drawing them from a ballot box. The marginate series cost me a lot of trouble in the first instance to put them in definite order, but the rule still prevails of naming them at haphazard and without any rule at all. The Marginata of my list has green stems, the leafstalks slightly purplish, the leaves bluntly triangular, the ground colour dark green mottled with patches of light green and a thin wash of grey; the margins creamy white during summer, in autumn showing tints of red or purple, the tone of which is greatly influenced by weather and local circumstances.

Syn. *Argentea elegans*, *Arborescens variegata*.

32. MARGINATA GRANDIS has broad leaves and a rich massive appearance, with a decided touch of blue in the central parts of the leaf. It is boldly margined with creamy variegation, which never tends to any tone of yellow. It is a true running Ivy, yet the growth is short and stout, and occasionally short spurs with entire ovate leaves appear representing the growth of a fruiting Ivy. These arborescent shoots often produce flowers, but the fruits do not so often appear.

Syn. *Marginata robusta*, *Arborescens marginata*, *Tricolor*, *Elegantissima*, *Marginata grandis*.

33. MARGINATA MAJOR is a grand member of this series, the leaves broad, obscurely lobed; the colour deep bluish green, with broad margin of creamy variegation with a decided tinge of yellow.

Syn. *Marginata argentea*, *Marginata pulchella*, *Marginata elegantissima*, *Marginata purpurea*, *Silver Stripe*.

33. MARGINATA MEDIA comes near to Marginata grandis, but is always less robust; the variegation creamy white without any trace of yellow.

Syn. *Marginata elegantissima*, *Marginata robusta*, *Elegantissima marginata rubra*.

34. MARGINATA MINOR is the collective name of a group of small-leaved Ivies with silvery margins that appear to be from a common stock, but slightly differing amongst themselves. They agree in a weakly and wiry growth; the leaves are small, angular, deltoid in form, obscurely lobed, the central part dull green, slightly washed with grey, the margin a clear cream colour passing into red or purple in autumn, but never acquiring so full a tone of red as the next on the list.

Syn. *Marginata argentea*, *Folius argosencens* (?), *Marginata elegans*, *Cavendishi*, *Marginata latifolia*, *Aurea elegantissima*, *Broad-leaved Silver*, *Marginata purpurea*.

36. MARGINATA RUBRA agrees in a general way with Marginata media, but differs in autumn when the margins of the leaves and the leafstalks acquire a lively red or purple colour, which increases in intensity until the end of the year, after which it passes away, so that in spring, when growth recommences, there is scarcely a stain of red left. This is a tender variety, and is often injured by frost or long-continued winter damp.

Syn. *Cullisi*, *Elegantissima*, *Argentea rubra*, *Latifolia elegans*, *Tricolor*, *Marginata pulchella*, *Elegantissima marginata*.

37. SUB-MARGINATA is distinct and beautiful, rich in colour and in synonyms. The stems are purplish; the leaves are of medium size, irregular spoon-shaped, or broad with unequal base and one blunt lobe;

the colour deep bluish green, margined with a thin line of whitish variegation, supplemented in autumn by pleasing shades of purple and red. It is distinct and beautiful.

Syn. *Rhombea variegata*, *Marginata major*, *Rhomboides Japonica*, *Japonica variegata*, *New Japanese*, *Scintilla argentea*, *Purpurea metallica*, *Rhomboides obovata variegata*.

38. MARGINATA LACTEA is deep and beautiful, the stems deep purple, the leafstalks reddish-purple, the leaves triangular with obscure blunt rhomboid basal lobes, or with occasional ear-like lobes projecting singly. The ground colour dark green with a few faint blotches of grey, the margin bright cream colour, delicately tinged with pink in autumn.

Syn. *Arborescens alba lutescens*.

39. DISCOLOR has a neat habit of growth, and is easily identified. The leaves are deltoid, with three to five obtuse lobes; the prevailing colour dark dull green, the whole plant sprinkled with grey dots, the young growth being almost white, and sometimes tinged with red, and the young leafstalks red. In winter there remains but little of the variegation.

Syn. *Maculata*, *Minor Marmorata*, *Maculata minor*, *Marmorata elegantissima*.

40. CINEREA MARGINATA is a silvery margined form of the Himalayan Ivy. It is of no particular value.

Syn. *Broad-leaved silver* (?).

41. MARGINATA AUREA is one of the best of the golden-leaved wall Ivies. The young stems are stout, the leaves elongate triangular, delicately margined with faint orange yellow, tending to red.

Syn. *Robusta*.

42. SULPHUREA has a peculiar appearance, and is easily identified; the leaves are small, triangular, and flat, often spoon-shaped and concave, with small ear-like lobes; the variegation is plentiful but dull; the prevailing colours sulphur-yellow and impure cream.

Syn. *Marginata argentea*, *Arborescens argentea variegata*, *Marginata canescens*.

43. CHRYSOPHYLLA is a free growing golden-leaved Ivy that soon becomes tree-like under pot culture. In its climbing growth its broad leaves are variously lobed, but the lobes obtuse and few in number. The variegation occurs in patches on the young growth, many of the leaves being wholly of a deep yellow, others mottled with paler yellow on a green ground, and much of the plant deep green without any variegation. There are several rather distinct forms of this, the products of local circumstances, the best of them are richly golden and agreeably constant.

Syn. *Aurea spectabilis*, *Spectabilis aurea*, *Aurea densa minor*, *Aurea or Golden*, *Aurea maculata*, *Canariensis aurea marmorata*, *Folius aurea*.

44. CHRYSOPHYLLA PALMATA.—Leaves distinctly and handsomely palmate lobed, the colour nearly the same as the last.

Syn. *Palmata aurea*, *Palmata nova aurea* (a selected form), *Mrs. Pollock*.

45. SUCCINATA is of a weakly habit, neat and pretty, but not showy; the leaves are bluntly sagittate in form; richly mottled amber and pale green. A gem for the rockery.

46. CHRYSOMELA will become famous as "Golden Gem," for it is a golden form of my "Emerald Gem," and hitherto has proved the finest of the golden Ivies. The leaves are in general smaller than those of Emerald Gem, but a certain number are exact counterparts of them in every particular; others are wholly of a rich brilliant orange colour or patched, and margined with variegation of a deep yellow colour.

Syn. *Golden Gem*.

ARBORESCENT FORMS OF HEDERA HELIX.

47. MELANOCARPA is the common European Ivy as met with on towers and ruins where it has ceased to climb, and has become tree-like and fruitful. The habit of growth is much influenced by position; in gardens it is usually long-jointed and wiry, in places much exposed, short, stout, and compact. The leaves are ovate, without lobes, and much prolonged, or broad and oval, sometimes short with a few obscure lobes; the colour deep rich green and glossy. The green flowers appear in September, and give to the tree a most beautiful appearance. They are succeeded by black berries.

Syn. *Arborescens*, *Arborea*, *Baccifera nigra*.

48. CORRUGATA is the counterpart of crenata and assumably its fruiting form. It is handsome as a garden shrub, and bears fruit plentifully.

Syn. *Palmata digitata*, *Helix incisa*, *Baccifera crenata*.

49. LATIFOLIA is a large-leaved fruiting Ivy, the leaves broad ovate, deep green. It is common in the Channel Islands.

Syn. *Baccifera latifolia*.

50. CHRYSOCARPA differs but little in leafage from our common Melanocarpa, but is less robust in habit, and forms a neater bush. The berries are of a dull yellow colour. This, beyond all doubt, is the Poet's Ivy, and if a fanciful name could be of any use, we would name it "Poetica."

Syn. *Baccifera lutea*, *Arborea flava*.

51. LEUCOCARPA is a variety of the foregoing with white berries. I have not seen the fruit.

Syn. *Baccifera alba*.

52. RUBROCARPA is a provisional name for the red-berried Ivy M. Andre has reported on. It appears to be the fruiting form of Cinerea.

53. ARGENTEA MAJOR is a free-growing, handsome, silvery-leaved

tree Ivy. The growth is free and somewhat scandent, and in the arborescent series it is the counterpart of *Marginata grandis* among the climbing Ivies. The green part of the leaf is rich holly green, the margin creamy or whitish, the whole leaf highly varnished.

Syn. *Canariensis argentea*, *Argentea elegans*, *New Silver*, *Latifolia argentea marginata*.

54. ARGENTEA MINOR is more decidedly arborescent than the last named, and exceedingly beautiful. The leaves are almost uniformly ovate and slightly concave, but a few short side-lobes occur. The central part of the leaf is of a grey green, with broad margin of clear creamy variegation.

Syn. *Marginata argentea*, *Marginata aurea*, *Arborea variegata*, *Japonica argentea*, *Pine's New Silver*.

ARGENTEA FULGENS is the most brilliantly coloured of the creamy-edged tree Ivies; the leaves are broadly and irregularly margined rich full cream, the central part rich dark green; the whole surface varnished. It grows slowly.

Syn. *Arborea elegantissima*, *Arborescens argentea*, *Helix arbor elegans*.

AUREOLA is useful as a tree Ivy, as in a full exposure it acquires a gay yellow colouring, less powerful than that of *Aurea*, while the leaves are often broadly three-lobed, and the colouring, a pale tint of yellow, is chiefly apparent on the young growth. Systematic pruning is essential to maintain the beauty of neat specimens.

55. LUTEOLA has a vigorous constitution. The stems and leafstalks are usually green, but sometimes purplish. The leaves vary from a broad ovate outline to an irregular rhomboid, and a few three-lobed leaves appear. The mature growth is green, the new rising leaves yellow.

Syn. *Pumila aurea*, *Aurea spectabilis*, *Arborea aurea*.

56. SUB-LUTEA may be regarded as the tree form of *Sulphurea*, but is a better plant, and makes a fairly good subject for pot culture.

Syn. *Arborescens minor lutea*, *Arborescens alba lutescens*, *Hedera variegata*.

57. AUREA is of bold character with ovate leaves like those of the common tree form of *Helix*. The young shoots are wholly of a rich golden colour. Inconstant, but a brilliant variety in a gravelly or chalky soil.

Syn. *Arborescens aurea maculata*.

58. SUB-FLAVA is a yellowish-tinted form of the tree *Helix*. It is of no particular value, but might be useful for winter bedding.

Syn. *Arborescens flava variegata*.

59. ALBO-LINEATA is a distinct and pleasing form of *Sub-marginata*, and may be called the tree Ivy of Japan. The leaves are long ovate, bright green, with a "wire edge" of whitish variegation.

Syn. *Veitchii*, *Rhomboides variegata*.

HEDERA CANARIENSIS, THE AFRICAN IVY.

60. CANARIENSIS.—The Linnæan name *Helix* being adopted in this list for the European Ivy, it will be consistent to allow Willdenow's "*Canariensis*" to appear for the so-called "Irish" or African Ivy. Though well known and universally appreciated, it may be proper to say here that in its climbing form the leaves are broad, fine-angled, the central and side lobes nearly corresponding in length and breadth, the basal lobes short and rounding handsomely to the insertion of the petiole, which is long and purplish. The colour of the leaf is a rich deep green distinctly marked with veins of a light green colour, the principal of which rise above the surface like threads laid on.

Syn. *Canariensis*, *Hibernica*, *Vegeta*, *Africana*.

61. VIRIDIS differs in form and colour from the Irish Ivy, the leaves are often orbicular, but generally speaking they are broadly ovate and obscurely three-lobed, the colour light bright green, the general appearance of the plant massive and robust, but by reason of its light colour, cheerful and very distinct. It is known in gardens as the "Algerian," and is doubtless more truly African than *Canariensis*.

Syn. *Algeriensis*, *gigantea*.

62. FICULA has the advantage of a distinct character that commands respect. The leaf is large, boldly cut into five to seven lobes, which are distinctly wedge-shaped from the middle to the blunt end, and from the base of the wedge are cut straight down to the blade. This and the peculiar dull green colour of the whole plant render it strikingly imitative of the common Fig, although perhaps on a close comparison the likeness would be somewhat remote. It has been figured as the Fig-leaved Ivy.

Syn. *Azorica*, *Canariensis azorica*.

63. CUSPIDATA MAJOR is a noble member of the group comprising *Palmata*, *Digitata*, and *Crenata*, the last the weakest of the group. The one now before us is the strongest, for it is a trifle more robust than the bold *Palmata*. The leafstalks are very long and of a grass-green colour, the leaf broad and expanding from the petiole in the sharp lines right and left to the apex of each of the basal lobes. The two side lobes are large and project forward, the middle lobe smaller, all the bifurcations cocked. The colour is a rich deep green, with the principal veins boldly marked.

Syn. *Hibernica palmata*.

VARIEGATED FORMS OF THE AFRICAN IVY.

64. VARIEGATA is a scarce variety of the Irish Ivy; the leafstalks are purplish, the leaves broadly wedge-shaped or obscurely three-lobed, the surface smooth and glossy; the central parts of leaf dark green, the margin bright primrose, tinted with cream colour.

Syn. *Hibernica variegata*.

65. PALLIDA is well known for its bold but inconstant variegation in large patches, and sometimes overspreading the whole leaf with pale primrose yellow.

Syn. *Golden Blotched*, *Hibernica variegata*, *Aurea maculata*, *Canariensis aurea*.

66. MACULATA has large, rough, wrinkled leaves, the leafstalks purplish; the variegation overspreads the plant in patches and streaks of clear cream-colour, intermixed with shades of greyish green and full dark green.

Syn. *Latifolia maculata*, *Marmorata*, *Variegata*, *Maculata latifolia*.

67. STRIATA, the streaked Ivy, is one of the most brilliant when in good colour. The leaves are less in size than the green form of *Canariensis*, barred, patched, and splashed with pleasing shades of yellowish cream, changing to paler cream; the young leaves often self-coloured rich cream. Grand for a great breadth of wall. The green parts of the leaf are very dark, and the bars and streaks exceedingly bright; it is a kind of "thunder and lightning" Ivy.

Syn. *Canariensis*, *Aurea maculata*, *Aurea marginata*, *Striped Irish*, *New Golden-rayed Irish*.

68. LACTEOLA is a superb plant; rich, delicate, constant, brilliant, and perfectly hardy. The young shoots are of a lively purple colour, the young leaves much blotched and patched with creamy variegation; the older leaves with a fair proportion of green more or less patched and streaked with variegation. One of its characters is to be found in the deficiency of form in the leaves; they are of many shapes and sizes, and usually unsymmetrical and ugly. This variety is a splendid development of *maculata*, and may be identified by its creamy colouring and absolute want of form.

Syn. *Maderiensis variegata*, *Lee's New Silver*, *Lee's Maderensis*.

69. CANESCENS requires a great space and considerable age to display its beauty, and when fully developed it may with propriety be called the "hoary Ivy." In a small state it is poor in appearance and tender in constitution. The leaves are irregular in form, and have no individual beauty; the central parts are greyish green, the margins clear cream. It is well known.

Syn. *Algeriensis foliis variegatis*, *Algeriensis variegata*.

ARBORESCENT FORMS OF THE AFRICAN IVY.

70. ARBORESCENS needs not to be described; it is the bold, fast-growing, rich green, fruiting form of the Irish Ivy. The leaves are broadly ovate and entire; but occasionally lobed leaves appear. It is the "sharp-leaved" Ivy.

Syn. *Canariensis arborescens*, *Hibernica arborescens*, *Canariensis fructifera*.

71. CORDIFOLIA differs from the last in having leaves uniformly cordate, thicker in texture, and lighter in colour; it is the fruiting form of the Algerian Ivy.

Syn. *Hibernica arborescens latifolia*, *Algeriensis arborea*.

72. FLAVA is a counterpart of *Pallida*, the variegation a deeper tone of yellow. It bears the same relation to *Pallida* that *Lacteola* bears to *Maculata* as a further development.

Syn. *Hedera arborea flava variegata*.

73. VARIOCOLORE is a form of *Cordifolia*, with a few stripes and patches of yellowish variegation.

Syn. *Hedera arborea latifolia striata*.

HEDERA COLCHICA, THE ASIATIC IVY.

74. COLCHICA of C. Koch has purple leafstalks and thick leaves of a broad cordate form, usually blunt at the apex, and showing two obscure side lobes. The colour is light green in youth, dark dull green, with occasionally a tinge of bronze when mature. This is a noble Ivy that grows freely, and in a rich soil, with shelter, produces leaves 7 inches in length by 5 in breadth. In the sandy soil in which I have it now the leaves are only half the size I have had them on strong clay land.

Syn. *Rægnieriana*, *Cordifolia*.

75. MACRODONTA is an appropriate name for the noblest wall Ivy we possess. It is of free growth, the leafstalks purplish, the leaves in general form wedge-shaped, with rounded shoulders from the insertion of the stalk to the apex of each side lobe, of which two, short and sharply cut, give distinct form to the leaf. There are indications of other two lobes lower down, whence the form is that of a wedge to the terminal point. The colour is rich full green, the substance leathery; the winter colour deep dull green, with shades of rich bronze.

Syn. *Amurensis*.

76. DENTATA is the largest-leaved Ivy known. The leaves are broadly ovate, or angular cordate, with shoulders almost square to the insertion of the stalk, and occasionally showing two obscure side lobes. On passing the finger along the edge of the leaf from the apex towards the base, a few fine, sharp teeth may be discovered, and these justify its name. It is truly a magnificent Ivy of a grass-green colour, but it always looks distressed, as though suffering from drought. So far from that being the case, a dry position suits it perfectly.

77. DENDROIDEA is the tree form of *Colchica*, a superb evergreen shrub for the front line, and for a selected position. It is the most tree-like of all the Ivies, and grows slowly. The leaves are smaller and narrower than those of the climbing form, and at some little distance the plant may be mistaken for a *Rhododendron*.

Syn. *Rægnieriana arborea*.

My collection consists of about 100 varieties, some twenty or more are either insufficiently distinct or in a probationary stage, and in other

ways not entitled at present to a place in a printed catalogue. Of the foregoing seventy-seven varieties about fifty may be found in the R.H.S. garden at Cbiswick.

CHRYSANTHEMUMS—PARIS GREEN.

ALLOW me to give my experience of the use of the Paris green against insects, as recommended by Mr. Meehan recently. I am growing about 300 Chrysanthemums for big blooms, which were infested with earwigs, and I have tried almost everything to stop them eating the tender leads of the plants without success, so that I bailed with delight anything which would prove a specific against "insects which eat." I therefore mixed the poison as advised, and applied to the plants, just sprinkling the shoots at the tops with a little of the powder. All went well from Thursday to Saturday, when the leads seemed drooping somewhat, and on the Sunday morning imagine my dismay at finding nearly the whole of my plants with dead leads, and all my chance of competing at any of this year's shows thrown clean away. This, as you may imagine, is very vexing and annoying, in addition to the loss of labour and time given by an amateur to the plants, which would soon have been showing the crown buds. I had about 100 cut down plants with three or four strong leads (which I was growing for grouping at our local show, where I obtained first prize last year), and which are of course utterly useless. I should be glad to know whether any similar result has been experienced by other growers, and I cannot but feel that in some way Mr. Meehan has erred for once in recommending something, which, although certainly killing the insects, or preventing their eating the shoots, is positively harmful to the plants themselves. I am afraid I am now quite out of it for this year's shows, but any useful hints would be more appreciated.—C. J. H. C.

[Mr. Meehan chiefly recommended the use of Paris green for destroying insects on fruit trees, and did not mention Chrysanthemums. Mr. Leonard Coates also stated that it was used in the same way in California at the rate of 1 lb. to 200 gallons of water. It is always wise to proceed experimentally with any new or doubtful remedy, and when we are consulted that is the course we invariably recommend.]

THE CARNATION AND PICOTEE UNION. ANNUAL EXHIBITION.

THIS took place in Mr. Dodwell's garden, Stanley Road, Oxford, on Thursday, August 1st. Of the wonderful display of flowers grown in pots by Mr. Dodwell, and some of his very fine seedlings, we must write later on, as so much space is wanted to fully report the Exhibition. The exhibitors were very numerous, from many parts of the kingdom, many of the flowers exceedingly fine, and in some cases a tendency to overdressing was visible. The extreme heat had told upon some of the flowers, but there was a general admiration of the great quantity of blooms staged, as well as the quality which prevailed.

In the class for *twelve Carnations*, first, Mr. T. Lord, with very fine blooms—viz., Master Fred, Reginald Power, Hewitt's John Harrison, George, Admiral Curzon, a very fine bloom of Deedic, Biddy Malone, William Skirving, Shirley Hibberd, John Ball, Squire Trow, and Robert Houlgrave. Second, Mr. R. Sydenham with Master Fred, James Douglas, Arthur Medhurst, Thalia, Alsimonde, Sarah Payne, Squire Whitbourn, Edward Rowan, George Melville (very good), Biddy Malone, Joseph Lakin, and Henry Cannell (this was also a good stand). Third, Mr. R. Thompson, in whose stand was a beautiful bloom of John Keat. Fourth, Mr. Joseph Lakin, Sybil, Wm. Skirving, and Joseph Lakin (very fine). Fifth, Mr. A. Brown, Thalia and Mrs. May. Sixth, Mr. Rowan, James Douglas and Matador. Seventh, Mr. Samuel Barlow, Crista Galli, Brilliant, and seedling S.F. (very fine). Eighth, Mr. George Chaundy.

Twelve Picotees, white grounds, dissimilar.—First, Mr. T. Lord, with J. B. Bryan, Lady Louise, Zerlina, Brunette, seedling 250 (heavy rose edge, fine petal), Thomas William (excellent), Nellie, Mrs. Sharp, John Smith, Annie Lord, Baroness Burdett Coutts, and one other. A grand lot. Second, Mr. Rowan, with Nellie, Amy Robsart, Mrs. Payne, Jessica, Brunette, Favourite, Mrs. Sharp, Lena, Mary, Edith D'Ombra, Thomas William, and Morna. Third, Mr. Robert Sydenham, with Mrs. Sharp, Her Majesty, Brunette, Annot Lyle, J. B. Bryant, Edith D'Ombra, Jessica, Laura, Hilda, Thomas William, Imogen, and Favourite. The second and third prize blooms were also very fine. Fourth, Mr. T. B. Thomson, Birmingham; fifth, Mr. A. Brown; sixth, Mr. G. Chaundy; seventh, Mr. J. Walker; eighth, Mr. T. Henwood; with five other exhibitors.

Six Carnations, dissimilar.—First, Mr. P. Hellewell, with a grand flower of Master Fred, George Melville, Squire Llewelyn, Robert Lord, Sportsman, and Crista Galli (handsome). Second, Mr. J. Whitham, with Wm. Skirving, Master Stanley, Robert Houlgrave, Crista Galli, James Douglas, and John Harrison. Third, Mr. Thomas Bower, including a fine bloom of Henry Cannell; fourth, Mr. Joe Edwards; fifth, Mr. C.

Phillips; sixth, Mr. W. H. Midgley; seventh, Mr. J. Heddesley; eighth, Mr. J. P. Sharp; ninth, Dr. Benson.

Six Picotees, white grounds, dissimilar.—First, Mr. J. Whitham, with Mrs. Sharp, Brunette, Annie Lord, Zerlina, John Smith, and Thomas William, all very pure in the ground colour. Second, Mr. T. Hellewell with Wm. Simmons. Lyddington's Favourite, Mrs. Payne, Zerlina, Brunette, and Mrs. Sharp. Third, Mr. A. W. Jones, Birmingham, with Favourite, Zerlina, Muriel, John Smith, Mary, and Mrs. Payne. Fourth, Mr. J. P. Sharp; fifth, Mr. W. H. Midgley; sixth, Mr. J. Heddesley; seventh, Mr. T. Bower; eighth, Mr. C. Phillips; ninth, Mr. W. Bacon; with nine other exhibits.

Twelve Miscellaneous Selfs, Fancies, or Yellow Grounds.—First Mr. Wm. Read, gardener to Mr. Dodwell, with grand blooms, consisting of seedlings 167, pale straw with brownish slate colour markings; 180, orange yellow with carmine markings; 24, rich rosy purple self, extra fine; Gladys, lovely soft peach, and excellent; 587, lemon with faint carmine markings; John Willett, rich deep scarlet; 588, straw self; 631, salmon scarlet self; 202, brighter than 167; all Mr. Dodwell's seedlings; also Emma Lakin, a grand white self, and two very distinct varieties from Mr. Benary of Erfurt, who introduced that finest of all yellow selfs, Germania, so generally shown; Schlieben (Benary), buff ground, with French grey markings, is quite distinct and novel in colour, and beautiful, with rose edged petal and form; Theodore (Benary), is of a leaden French grey colour, very distinct, and of fine form and petal. Second, Mr. T. Henwood, whose best were Black Knight, rich violet purple; Rose Celestial, a handsome self; Celia (Fancy), Germania, and Terra Cotta, a lovely variety. Third, Mr. Robert Sydenham, and in this stand was a good bloom of his beautiful rose self sport from Thalia; fourth, Mr. T. Lakin; fifth, Mr. T. Lord; sixth, Mr. T. Anstiss; seventh, Mr. T. B. Thomson; eighth, Mr. George Chaundy, jun.; with four other exhibits.

Six Blooms, Selfs, Fancies, or Yellow Grounds, dissimilar.—First Mr. A. W. Jones, with Mrs. McLaren, Terra Cotta, Mrs. Price, Sir Terry Belch, Mars, and The Bride. Second, Mr. J. S. Heddesley; third, Mr. F. Hooper; fourth, Mr. A. Brown; fifth, Mr. C. Phillips; sixth, Mr. S. Barlow; seventh, Mr. H. Startup; eighth, Dr. Benson; ninth, Mr. Joe Edwards.

These classes were generally and most deservedly admired, and were well filled, and the general verdict given was that fancies and selfs are coming rapidly to the front, alike for their great beauty and variety of colours, and for their free growing habits.

The Kilmurry yellow ground seedlings were naturally looked over with great interest, and many of them are very fine, fully justifying Mr. Dodwell's belief in them at first. Nine prizes were offered for six blooms, not less than three dissimilar, and the various exhibits were a great attraction. Mr. W. Read, gardener to Mr. Dodwell, was first with a splendid six—viz., Alfrey Grev, Tournament, Patrician, Queen of Hearts, Exile, and Nancy. Second, Mr. F. Nutt, Rachel, very fine, and Nora, a first class yellow, Exile and Tournament; third, Mr. G. Chaundy, jun., Gretchen, Nora, and Queen of Hearts, all good; fourth, Mr. Robert Sydenham; fifth, Mr. W. Bacon; sixth, Mr. J. Heddesley; seventh, Mr. Joseph Lakin; eighth, Mr. Storror, a capital bloom of Queen of Hearts was in this stand; ninth, Dr. Benson.

For six Yellow Grounds, dissimilar, any raiser, there was a superb display made by sixteen exhibitors. Mr. W. Read, was first with wonderfully good blooms of Dodwell's seedlings, 180, 191, 202, 117, Lemon Drop, and Mr. Milner, yellow self. It is questionable if finer blooms have ever been staged. Second, Mr. J. Hooper, with Almira, Annie Douglas, Agnes Chambers, Dorothy, Terra Cotta, and Duchess of Teck, very fine. Third, Mr. J. Lakin, with Almira, Annie Douglas, Colonial Beauty, Germania, Agnes Chambers, and Dorothy. Fourth, Mr. T. Henwood; fifth, Mr. R. Sydenham; sixth, Mr. George Chaundy; seventh, Mr. J. Heddesley; eighth, Mr. F. Nutt; ninth, Mr. A. Brown.

The exhibits in the various classes of single specimens were most numerous, and gave the Judges much work. For Carnations (eight classes) there were eight prizes in each class—viz.: *Scarlet Bizarres*.—First and fourth Mr. Lord with Robert Houlgrave, second and seventh with Admiral Curzon, third with Fred, sixth with Alfred, eighth with Master Stanley; Mr. Samuel Barlow being fifth with Robert Houlgrave. *Crimson Bizarres*.—First Mr. Sydenham with Master Fred, and third and seventh with Joseph Lakin; second, Mr. Lord, with Master Fred, fifth with J. M. Bacon, and sixth with Master Fred; fourth, Mr. Thos. Bowes, with Master Fred; and eighth, Mr. T. B. Thomson, with James Merryweather. *Pink Bizarres*.—First and second, Mr. Lord, with John Harrison, excellent; fourth and sixth with Wm. Skirving; third, Mr. Sydenham, with Thomas Anstiss and seventh with Sarah Payne; fifth, Mr. T. B. Thomson, with Sarah Payne; and eighth, Mr. J. Edwards, with William Skirving.

Purple Flakes.—First, Mr. Lord, with Mayor of Nottingham; eighth, George Melville; second and fourth, Mr. T. B. Thomson, with George Melville; third, Mr. Sydenham, with a sport (Sporting Lass) from Sarah Payne; fifth, Mr. Rowan, with George Melville; sixth, Mr. S. Barlow, with Mayor of Nottingham; seventh, Mr. T. Bowes, with Juno. *Scarlet Flakes*.—First, Mr. Sydenham, with Alsimonde, and sixth with Matador; second and fifth, Mr. T. Lord, with Ivanhoe; fourth with Matador, and seventh with Henry Cannell; third, Mr. T. B. Thomson, with Robert Marris; and eighth, Mr. Heddesley, with Tom Lord. *Rose Flakes*.—First, second, third, and fourth, Mr. A. R. Brown, with Thalia; fifth, Mr. Lord, with Crista Galli; sixth and seventh, Mr. Thomas Bowes, with Sibyl; eighth, Mr. Lakin, with Crista Galli.

Sels.—First, Mr. T. B. Thomson, with Germania, a superb yellow; second and fifth, Mr. Lakin, with Emma; fourth, Mr. Heddesley, with Gladys; seventh, Mr. Henwood, with Germania. We could see no names to the other winners.

Fancies.—First, Mr. Read, with Dodwell's seedling 167; third with seedling, and fifth with Terra Cotta; second, Mr. Henwood, with Dorothy; fourth, Mr. A. W. Jones, with Mrs. Maclaren; sixth, Mr. F. Hooper, with Lady Edwards; seventh, Mr. Heddesley, with a seedling; and eighth with Dodwell's Seedling 163.

IN PICOTEES.—*Heavy Reds.*—First, Mr. Read, with Isabel Lakin. Second, third, fourth and fifth Mr. Lord with Brunette. Sixth, Mr. T. B. Thomson with Dr. Epps, and eighth, Mr. R. Sydenham with Brunette. *Light Reds.*—Mr. Lord, first, second, fourth, fifth and seventh with Thomas Williams, Mr. T. B. Thomson third, and Mr. S. Barlow eighth with the same, Mr. Rowan sixth with Mrs. Gorton.

Heavy Purple.—First, Mr. Lord with Mrs. A. Chancellor; fourth, fifth and sixth with Zerlina, eighth Muriel, and second with Amy Robsart. Third, Mr. Jones, seventh, Mr. T. B. Thomson, both with Muriel. *Light Purple.*—First, Mr. T. Henwood with Jessie. Second, Mr. Lord with Baroness Burdett Coutts; fourth and sixth with Mary, and fifth and seventh with Annie Lord. Third, Mr. Rowan with Mary, and eighth, Mr. Joc Edwards with Annie Lord.

Heavy Rose.—First, third and sixth, Mr. Lord with Lady Louise and seventh with Mrs. Sharp. Second, Mr. T. B. Thomson with Campanini, and fifth with Edith D'Ombra. Fourth, Mr. Reid with seedling. Eighth, Mr. Sydenham with Mrs. Sharp. *Light Rose.*—First, fourth, and eighth, Mr. Rowan with Nellie. Second, Mr. Lord with Favourite and third with Nellie. Fifth and sixth Mr. Reid with Nellie, and seventh Mr. W. A. Jones with Favourite.

Yellow Grounds.—Mr. Reid first and third with Almira; second Dodwell's 180; fourth, Germania; seventh, Tournament. Mr. Lakin fifth with Germania and eighth with Agnes Chambers. Sixth, Mr. Henwood with Agnes Chambers.

PREMIER BLOOMS IN THE EXHIBITION. *Carnation.*—Robert Houlgrave, S.B., by Mr. T. Lord. *Picotee.*—Lady Louisa by Mr. T. Lord; yellow self Germania by Mr. Rowan; yellow ground Annie Douglas by Mr. Lakin; Fancy, Dodwell's 167, a peculiar and heavy shade of pale cream and deep lilac, extra fine, by Mr. Reid.

The luncheon followed the judging, and over one hundred friends sat down, Mr. Samuel Barlow in the chair, Mr. Shirley Hibberd in the vice-chair, with Mr. Alderman Buckle of Oxford, and a large number of Mr. Dodwell's friends. It was a wonderful representative gathering of old and young florists, and a strong expression of esteem for Mr. Dodwell, and in full appreciative recognition of the great work he has done for close upon fifty years as a true florist, and in the interest of the Carnation and Picotee in particular, was manifested in the speeches after the luncheon.

Shortly we shall refer to some of his fine seedlings and the display of plants in pots.—AN OLD HAND.

HANCOCK'S IMPROVED PLANT POT.

As will have been noticed, commendatory letters have been published from Chrysanthemum growers respecting this flower pot. The

FIG. 15.—SECTION.

FIG. 16.—OUTSIDE.

illustrations show exactly what it is—one pot suspended in another. A specimen before us shows the pot to be strong, well made, neat in appearance, and not so likely to be blown over during a gale as ordinary pots are. The advantages claimed for the double pot are:—1st, The protection of the inner pot from the heat of the sun, thereby preventing the roots being burnt, and ensuring a more even moisture and temperature about the roots. 2nd, Less watering required, consequently less labour. 3rd, Economy of manure, by reason of its strength not being washed away by such frequent waterings. 4th, Security against intrusion of worms. 5th, Greater base to the pot, thereby less risk of being blown or knocked over. 6th, Avoidance, in a great measure, of the alternate roasting and drenching which the roots experience in hot weather.

We think all those claims can be sustained, and, subject to the exercise of sound judgment in watering, for the "knuckle test" cannot

be applied, no doubt Chrysanthemums can be well grown in these pots; and they are not less suitable for Roses and other plants, also fruit-trees in pots placed outdoors in the summer.

HORTICULTURAL SHOWS.

HAYWARDS HEATH HORTICULTURAL SOCIETY.

THIS Society held their first annual Show on Wednesday, the 31st July, in a beautifully situated meadow, by kind permission of Mr. Pannett, under the most favourable and encouraging circumstances. The inhabitants of this prosperous and progressive town have been lagging behind many of the neighbouring villages in Mid-Sussex in horticultural matters, but now they have taken it up they have done so in a manner that shows they mean business. The ladies and gentlemen in the neighbourhood have subscribed liberally to its funds, as have also the local tradesmen; and the way the people turned out, and the hundreds of smiling faces and hearty greetings showed that the efforts of the Society were thoroughly appreciated.

This Society's operations extend to a wider area than the majority of local societies, including twelve parishes—in fact, nearly the whole of Mid-Sussex; and there are thirteen special classes open to the county. In the latter were included groups of miscellaneous plants, Ferns, and foliage plants, and the entries were sufficiently numerous to make a very creditable show. It was gratifying to see a local man—Mr. George Stringer, gardener to R. A. Bevan, Esq., Horsham, Cuckfield—taking first place with his miscellaneous group. Mr. W. Jupp, gardener to T. G. Boulton, Esq., Eastbourne, had the most effective exhibit of foliage plants, his Crotons being very finely coloured, and the arrangement very good. The first prize for a group of Ferns was awarded to some in which there had not been the slightest effort at arrangement for effect, which caused no little dissatisfaction amongst the other exhibitors. No doubt the Judges' manner of reading the schedule, "best collection of Ferns," was correct, although it was generally felt that it did not express the intention of the Committee. A novel class was introduced for the "best collection of fruits, flowers and vegetables, staged for effect, space not to exceed 5 feet square," but not a gardener in the county dared to tackle it. For a collection of nine varieties of vegetables Mr. W. Manton, gardener to Mrs. Borer, Boring, was an easy first with fine samples.

In the division open to Mid-Sussex gardeners only, the entries in the plant classes were not so numerous as would have been expected; no doubt the fact that Handcross is included in the district would make local men rather shy at the idea of having a brush with the specimens from that well-known garden. Mr. J. Voss, gardener to W. Savill, Esq., Lindfield, was first for four foliage plants. Mr. Wickham, Burgess Hill, was first for six Ferns, and the same for six Begonias, the latter being well-grown plants of excellent double varieties. Cut flowers were not a great show, herbaceous flowers being most attractive. The show of fruit was very fair; the entries for Grapes, Melons, Tomatoes, Gooseberries, Currants, &c., were fairly numerous. Mr. Holman, from Hassocks, was first for black Grapes; Mr. Warren, gardener to Mrs. Hanky, Balcombe Place, first for white, with very good Muscats; Mr. Holman had the best Peaches.

The local nurserymen came well to the front. Messrs. Wood and Son, Burcham, Chesham and Sons, Mr. Knight, Mr. Woollard, and Mr. Piper, all had interesting exhibits. The latter gentleman showed two fine fruits of *Araucaria imbricata* from the fine specimens in the Piltdown Nurseries, and with them were shown specimens of the ripe seeds and some small two-year-old seedlings. There were also separate divisions for amateurs and cottagers. On the whole, the first Show of this Society may be regarded as a success. They have an excellent place to hold it in, and it was greatly helped by S. T. D. Thorowgood, Esq., kindly throwing his romantic grounds adjoining open for the occasion, a privilege that was largely taken advantage of. The Committee of this Society did a business-like thing in having a fixed date—viz., the last Wednesday of July. May they go on and prosper, and so fill the place of the now defunct Brighton and Sussex Horticultural Society. By doing so they will give Sussex gardeners a chance of meeting once a year in a most suitable and central place, with every facility for travelling and conveyance of plants, &c., by the railway company. Mr. A. Willmot is the efficient Honorary Secretary.

THE LIVERPOOL SHOW.—AUGUST 3RD AND 5TH.

THE tenth summer Exhibition of this Society was held for the first time in the grounds of the City Police Athletic Society, Fairfield. The position is a good one, but sadly lacks the beautiful surroundings that were so enjoyable at Sefton Park, where the Exhibition has been held from the commencement. The park unfortunately is not easy of access, but the present place is in a moderately thickly populated district. The attendance on the first day, however, as the weather was not very favourable, was not such to excite any great hopes of much better success.

The Exhibition was on the whole equal to those of past years, and the stove and greenhouse plants have never been surpassed. The arrangement was unique, certainly the most perfect at any provincial exhibition. The tents were entered in the centre, which were furnished with Tuberous Begonias, while the stove and greenhouse plants occupied the large tent to the right and left. At the east end were groups and cut flowers, and at the west fruit, vegetables, and groups in the centre. The whole was one large tent projecting at each end considerably, with

a suitable entrance erected in the centre, but not projecting so far as the ends.

Stove and Greenhouse Plants.—These were never better, or shown in larger numbers. In the open class for twelve specimens, six foliage and six flowering, Mr. J. Cypher, Cheltenham, staged in his well-known style, and was accorded the post of honour. His most striking plants were Croton Victoria, C. Sunset, Kentia Fosteriana, Cycas circinalis, Latania borbonica, Ixora Williamsi, Ixora Regina, Erica Iveryana (very good, profusely flowered), Erica obbata purpurea, and Bougainvillea glabra. Mr. W. Finch, gardener to J. Marriott, Esq., Princess Road, Coventry, second; and Mr. C. Roberts, gardener to A. Nickolson, Esq., Leek, Staffordshire, third. In the corresponding class for six plants Mr. Cromwell, gardener to T. S. Timmis, Esq., Cleverley, Allerton, was well first with clean, healthy plants. Mr. A. R. Cox, gardener to W. H. Watts, Esq., Elm Hall, Wavertree, followed, and Mr. J. Jellico, gardener to F. H. Gossage, Esq., Camp Hill, Wootton, secured the remaining award. For four stove and greenhouse flowering plants, Mr. A. R. Cox, who was placed third, was afterwards given the first position, and his opponents disqualified through staging all stove plants. For one stove plant in bloom Mr. P. Barber, gardener to A. Barnsley, Esq., St. Michaels, was first with a large well-flowered specimen of *Oncidium flexuosum*, Mr. Cromwell second with *Ixora Pilgrimi*, and Mr. Cox third with *Ixora coccinea*. For one greenhouse plant Mr. Finch, gardener to J. Marriott, Esq., Princes Road, Coventry, was first with *Erica impressa*, neat and well flowered. Mr. Cox followed with *Phenocoma prolifera*, a very healthy young specimen. Mr. J. Wilson, gardener to O. H. Williams, Esq., Aigburth, secured the remaining award with a large *Kalosanthus*.

Fine-foliaged Plants.—These were equal in numbers and quality to what have been staged in previous years; in fact, on the whole the plants were fresher and the Crotons more highly coloured. For six plants Mr. J. Jellico was accorded the post of honour, followed by Mr. B. Cromwell, who was a very good second. For four plants, Mr. Thos. Healy, gardener to Col. T. Wilson, Hillside House, Mossley Hill, secured the first; Mr. A. R. Cox was a close second, and Mr. T. Foster, gardener to J. Brancker, Esq., third.

Palms and Cycads.—At the present Exhibition these were all that could be desired in quality, but the numbers did not exceed what have been staged on past occasions. Mr. C. Roberts for three plants took the lead with *Kentia Fosteriana*, *Encephalartos villosus*, and *Latania borbonica*; Mr. A. Cox second, and Mr. J. Jellico third. For one plant Mr. C. Roberts took the lead, followed by Mr. Thos. Healy and Mr. J. Jellico.

Ferns were staged in excellent condition, both exotic and hardy. The plants staged by Mr. Cromwell in the open class for eight exotics were specially worthy of note. The plants were large, clean, and in the best possible condition. The varieties were *Davallia tenuifolia*, *D. fijiensis plumosa*, *Gleichenia Mendelli*, *Nephrolepis furcans*, *N. rupestris*, *Pteris scaberula*. For four plants Mr. Cox took the lead with grand plants of *Cyathea Smithii*, *Cibotium Schiedeii*, *Microlepia hirta cristata*, and *Davallia polydactyla*. Mr. G. Eaton, gardener to W. H. Shirley, Esq., second; and Mr. Thos. Foster third. The last exhibitor took the lead for two filmy Ferns, and staged capital examples. For one Tree Fern Mr. A. R. Cox was first. For one exotic Fern, Mr. Healy was successful. For six hardy Ferns Mr. P. Barber was successful, followed by Mr. J. Hurst, gardener to W. B. Bowering, Esq. Mr. Thos. Foster was first for four pairs of *Lycopodiums*.

Ericas were not numerous, but with one or two exceptions those staged were healthy, not large, but well flowered. For three plants Mr. Cox was first, followed by Mr. J. Cypher.

Tuberous Begonias were exceedingly good, the plants being principally new or moderately new varieties, with large flowers. The plants contributed by successful exhibitors were in most cases 3 feet or more through them. For six plants Mr. Cox was well ahead, followed by Mr. J. Hurst and Mr. T. Jones, gardener to W. C. Clark, Esq. For three plants the same exhibitor was again first, followed by Mr. T. Moorehouse, gardener to R. Brocklehurst, Esq., and Mr. J. Hurst. For one plant Mr. Cox was again successful with a capital specimen.

Coleuses and Cockscombs were good, and the prizes offered were well contested. For six plants of the former Mr. G. Eaton with well-developed plants of bright telling varieties. For six of the latter Mr. J. Stoney, gardener to Sir Thos. Earle, Bart., Allerton Towers, was successful.

Caladiums could not have been exhibited in better condition, the plants standing up well without the slightest support. For six plants Mr. J. Warrington, gardener to T. Bright, Esq., took the lead. Mr. J. Hurst was successful for *Petunias*, which were also shown in capital condition.

Fuchsias and Pelargoniums.—The former have never been shown in the best possible condition, but this year the plants displayed a marked improvement. For three plants Mr. Cox took the lead with large pyramidal plants, 6 or 7 feet high, and most profusely flowered. Mr. Cromwell was successful with one plant. The *Pelargoniums* were numerous and formed a brilliant display, nearly every example being in good condition. For four singles Mr. T. Gowan was first. For one Mr. D. McKellar, gardener to A. J. Steel, Esq., Bank Hill Road, Aigburth, took the lead. Mr. J. Gowan was again to the fore with four doubles, and Mr. J. Stoney for four ivyleaf varieties, the plants being large and profusely flowered.

Groups.—These have been steadily improving, and on the whole were this year better than ever. In the open class no one competed against

Messrs. R. P. Kerr & Sons, Aigburth. They staged in their usual style an exceedingly effective group, and were deservedly given the first award. In the corresponding local class for a circular group for effect, space not to exceed 250 square feet, Mr. A. R. Cox was first with a light, tasteful arrangement; Mr. Jellico was a close second, followed by Mr. J. Jones with a heavier and too green an arrangement, Mr. T. Moorehouse being awarded an extra prize.

Table plants were staged in the usual style, small, neat, and effective. Mr. C. Evans, gardener to W. Maxwell, Esq., Aigburth, was first, followed by Mr. J. Jellico and Mr. J. Lambert, gardener to Col. Wingfield, Onslow Hall, Shrewsbury.

Cut Flowers.—Roses have been staged in larger numbers and of better quality, with the exception perhaps of those that took the lead in the class for forty-eight distinct single blooms; but considering the weather for a few days previous to the Show, those staged were creditable throughout. In the class for forty-eight Messrs. Alex. Dickson and Sons, Newtonards, were a long way ahead with magnificent blooms, Mrs. J. Laing being especially conspicuous. Messrs. J. Cocker & Sons were placed second, and Messrs. T. Smith & Sons, Stranraer, third. Four collections were staged. For eighteen Tea and Noisette varieties the same number were staged, and the second-named exhibitor gained the post of honour for a capital collection of fresh bright blooms. Mr. H. Merryweather, Southwell, was second, and Messrs. A. Dickson and Sons third with large but loose blooms. For twenty-four Mr. T. Leadbetter, gardener to T. B. Hall, Esq., Larchwood, Rock Ferry, was first with capital blooms, slightly spotted by heavy rains. Mr. S. Budd, Bath, second. For twelve blooms Mr. T. B. Hall was again successful, followed by Mr. Bell, St. George's Mount, and S. H. Stott, Esq., the last being a very weak stand. In the corresponding class for twelve, six dark and six light, of two varieties, Messrs. A. Dickson & Sons were first with Alfred Colomb and La France. Messrs. J. Smith & Sons second with Marshal P. Wilder and Mcrveille de Lyon. Third, Messrs. Cocker & Sons. For the best and most tastefully arranged box, not less than twelve varieties, box 4 feet long by 1½ foot wide, four competitors staged, and Mr. T. B. Hall was first with the best flowers, showing both H.P.'s and Teas on a base of *Adiantum cuneatum*. Mr. J. Gee, Greenhill, Allerton, was second; and Mr. J. Raffles Bully, Breck Hey, third. Stove and greenhouse cut flowers have been considerably better in the past. The stand of eighteen distinct kinds was poor, and needs no further comment. The first stand for twelve varieties was all that could be desired. Mr. J. Bounds, gardener to A. L. Jones, Esq., Oaklands, Aigburth, was deservedly successful; Mr. J. Warrington and Mr. J. Hurst also showing well, and gained honours in the order named.

Herbaceous cut flowers have been good in past years, but on the present occasion they were excellent. The competition was keen, every collection being of admirable quality. For a collection of twenty-four Mr. G. Eaton was first, Messrs. Dicksons (Limited), Chester, second, and Mr. J. Warrington third. For twelve Mr. J. Bounds was first. For two bouquets in the open class Mr. T. Jones, florist, Hardman Street, Liverpool, was the only exhibitor, and was placed first for two splendid examples. Those in the local class for one were very poor indeed. For eighteen Carnations Mr. R. Brownhill, Ravenswood, Rock Ferry, was well first. For twelve Dahlias Mr. G. Burden, gardener to G. Cockburn, Esq., Oxtun, was first with capital blooms.

Fruit.—The average quality of the past years was maintained, but there was a considerable falling off in numbers, especially in the Grape, Peach, and Nectarine classes. For the collection of twelve dishes, distinct, Mr. J. Edmunds, gardener to the Duke of St. Albans, Bestwood, was first, having splendid Madresfield Court and Muscat of Alexandria Grapes, the two bunches of the latter being considerably finer than any in the Exhibition. Other dishes were Best of All Melon, Brown Turkey Figs, Early Prolific Plums, Queen Pine, Elruge Nectarine, and Grosse Mignonne Peaches. Mr. J. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was second, and Mr. Dawes, gardener to Hon. Mrs. Ingram, Leeds, third. For six dishes Mr. T. Elsworthy, gardener to A. R. Gladstone, Esq., Court Hey, Liverpool, was first, followed by Mr. J. Stoney. For four bunches of Grapes five collections were staged. Mr. G. Middleton, gardener to R. Pilkington, Esq., Rainford Hall, was first with large well coloured bunches of Madresfield Court, Black Hamburg, Muscat Alexandria, and Buckland Sweetwater. Mr. J. Stevenson, gardener to Col. Pilkington, Prescot, was second, and Mr. T. Elsworthy third, both showing remarkably well. For two bunches of Black Hamburg Grapes Mr. J. Stevenson was first with large bunches with large berries perfectly coloured. Mr. S. Burden, gardener to J. D. Tyson, Esq., second, and Mr. W. Oldham, gardener to J. Beecham, Esq., Huyton, third. Both the second and third were almost perfect examples. For two bunches Muscat of Alexandria Mr. J. Stoney was first with large bunches with good berries slightly spotted by syringing. Mr. J. Edmunds was second with good bunches rather short of colour, and Mr. Middleton third with fine bunches, which had been, from appearance, suddenly exposed to the light. For two bunches any other black Mr. Middleton was first with superb bunches of Madresfield Court, large bunches with good berries well coloured. For two bunches, any other white, Mr. J. Bennett, gardener to the Hon. C. H. Wynn, was first. For one dish of Peaches Mr. W. H. Divers, Ketton Hall, was first with large highly coloured fruits of Royal George. Mr. Elsworthy was second with Bellegarde. For one dish of Nectarines the last exhibitor was first with Elruge. For one green-fleshed Melon Mr. J. Craven, gardener to J. Grant Morris, Esq., Allerton Priory, was first with Her-

of Lockinge. For one scarlet-flesh Melon Mr. J. Bennett was first with Sutton's Masterpiece.

Vegetables.—Exhibits in this department were numerous and good, especially in the classes devoted to collections. For twelve varieties, distinct, Mr. J. Lambert was first, followed by Mr. Forder, gardener to C. Cornwallis West, Esq., M.P., Ruthin Castle, and Mr. J. Stoney third. Eight collections were staged. In the corresponding local class for eight varieties ten were staged; the last named exhibitor was successful, followed closely by Mr. J. Littlemore, Aintree, and Mr. Pownall, Prescott. For six varieties, prizes offered by Messrs. Sutton & Sons, Reading, eight collections were staged. Mr. Forder took the lead with White Tripoli Onions, Perfection Toma'o, seedling Potato, President Pea, Magnum Bonum Cauliflower, and Scarlet Runner Beans, Mr. J. Lambert and Mr. J. Stoney being second and third respectively. For four dishes of Peas Mr. R. Dawes was first. For four dishes of Potatoes Mr. J. Winkworth, gardener to R. Brocklebank, Esq., Childwell Hall, was first. For three dishes of Tomatoes Mr. G. Eaton was placed first. For three plants in pots Mr. J. Stoney was first with healthy well fruited plants of Chiswick Red, Webb's Sensation, and Dedham Favourite.

Certificates of merit were granted to the Liverpool Horticultural Company, Garston, for groups of Tea Roses and wreaths; Mr. T. Jones, florist, Hardman Street, for crosses, wreaths, and other floral decorations; to Messrs. Dicksons, Limited, Chester, for a collection of stove and greenhouse flowering and foliage plants; Messrs. R. P. Ker & Sons for Vines in pots; Messrs. Laing & Mather, Kelso, for a large and varied collection of Carnations, both named and border kinds. The usual samples of implements were shown by Mr. J. Bramham, Messrs. F. & J. Mee, Bethel, Harkin, Webster, and H. Caesar, Knutsford, for which certificates of merit were granted.

SOUTHAMPTON—AUGUST 3RD AND 5TH.

THE Royal Horticultural Society of Southampton held a most satisfactory exhibition in their beautiful grounds in Westwood Park. This Society deserves a far greater share of success financially than they have obtained during the last two or three years, as, owing to bad weather and counter attractions, the receipts have not nearly come up to what is required to maintain its position. On the opening day rain fell in torrents. This, coupled with the Naval Review at Portsmouth, deterred many visitors from attending. The exhibits were arranged in two spacious marquees, one being 200 feet long and 75 feet wide. This contained the specimen stove and greenhouse plants, groups and other miscellaneous plants; the other tent being of the same length and 45 feet wide. In this was arranged down the middle, on two broad tables, the fruit, vegetables, cut flowers, and table decorations.

Plants.—These formed an important part of the Exhibition, substantial prizes being offered in the principal classes. In that for twelve stove or greenhouse specimens, six to be in bloom and the remainder foliage, there were three entries. Mr. J. Cypher, Cheltenham, won first honours with superior flowering plants, amongst which was a magnificent *Phenocoma prolifera* Barnesi, fully 7 feet in diameter, in perfect health and freely flowered, also a model *Erica tricolor coronata* 3 feet in diameter, densely flowered, fresh, and the admiration of all. Finely coloured Crotons and healthy Palms were also included. Mr. G. Lock, gardener to B. C. Cleave, Esq., Newcombe House, Crediton, Devon, was second, showing finely coloured Crotons, a little weak in flowering plants. Mr. Wills, gardener to Mrs. Pearce, Bassett, Southampton, took third honours with creditable examples.

With ten stove or greenhouse, five to be flowering and five foliage, there were three competitors. Mr. N. Blandford, gardener to Mrs. Haselfoot, Bitterne, was an easy first. Especially noticeable was *Allamanda Hendersoni* covered with flowers. Mr. Currey, gardener to Col. Pepper, Milford Hall, Salisbury, was second. Mr. Wills took first honours for six specimens in bloom, staging *Statice profusa* 6 feet across and finely flowered, the remainder being good also. Mr. Lock was second. The positions of these two exhibitors were reversed in the class for six foliage plants, Mr. Lock staging a healthy specimen of *Kentia Belmoreana*, and highly coloured Crotons *angustifolius* and *Johannis*.

Six competed in the miscellaneous group class of 120 square feet. Mr. Lock was an easy first with a charming arrangement of suitable plants; Mr. Wills was second, also with a good group. The last-named also exhibited *Fuchsias*, exotic and hardy Ferns, *Begonias*, and table plants, while Mr. Busby, gardener to F. Willan, Esq., Thornhill Park, Bitterne, was successful with *Gloxinias* and *Pelargoniums*.

Fruit.—Fruit was staged in fair numbers, and of capital quality. Five competitors staged collections of six varieties, Pines excluded. Mr. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, was easily first, having good Madresfield Court and Muscat of Alexandria Grapes, Hero of Lockinge Melon, and Elruge Nectarines finely coloured. Mr. G. Inglefield, gardener to Sir J. W. Kelk, Bart., Tedworth, Marlborough, was second; and Mr. J. Evans, gardener to Lady Ashburton, Melchet Court, Romsey, third. For three bunches of Black Grapes Mr. Inglefield, with very fine examples of Black Hamburgh, was an easy first; and Mr. Ward second with the same sort. With three bunches of Muscat Alexandria in the class for white Grapes Mr. Ward led the way. In the class for two bunches of black and white Grapes Mr. J. Allen, gardener to Captain the Hon. V. Montague, Wherwell Priory, Andover, took first honours with good produce in both classes. In the single bunch class for both black and white some good samples were staged; the best black bunch was from Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Fare-

ham, a good one of Black Hamburgh, and one for Mr. Ward, a finely coloured bunch of Buckland Sweetwater, gained first prize. Mr. Evans had the best scarlet flesh Melon. Mr. Annalls, gardener to T. G. Shenton, Esq., staged the best green flesh. In the special class for Melons the prizes presented by Messrs. Sutton & Sons, Reading, the fruit was of capital quality; with Hero of Lockinge Mr. Ward took first honours. Peaches and Nectarines were well shown by Mr. C. Curtis, gardener to J. S. Dixon, Esq., Hollybank, Dibden, and Mr. Inglefield. Apples were a small show, but other hardy fruits were good.

Vegetables.—These were staged in large numbers and of superb quality. In the class for twelve varieties Mr. C. J. Waite, gardener to Col. the Hon. W. P. Talbot, Glenhurst, Esher, was an easy first, and Mr. S. Wilkins, gardener to Lady Theodora Guest, Inwood, Henstridge, was second. For nine varieties eight competed. Mr. Allen carried off first honours with capital dishes, and Mr. Inglefield was second. Potatoes, Onions, Cucumbers, and especially Tomatoes were well shown. Fifteen dishes of the latter were staged in the two single dish classes set apart for them, Mr. Waite staging Perfection for the first place.

Cut Flowers.—A capital part of the Exhibition were formed by these. The first and second prize table decorations of Mr. J. R. Chard and Mr. J. Lock were simply perfect, while the bridal and ball bouquets from Messrs. Perkins & Sons, Coventry, left nothing to be desired. Roses from Messrs. Keynes, Williams & Co., Salisbury, were fresh and of rich colour and good form. Show Dahlias from the same firm were also of capital quality, being large, clean, and bright in colour. Mr. Evans staged the best stand of stove and greenhouse blooms; Messrs. Cheal and Son, Crawley, the best herbaceous flowers. Mr. F. Nutt, Rose Road, Southampton, staged the best yellow ground Carnations, very fine, while Mr. J. Peaback had the best Picotees. Messrs. Wood & Son, London, had a large display of horticultural sundries.

FRUIT FORCING.

PINES.—*Preparing Houses for Plants.*—Clean houses thoroughly as they become vacant before being again occupied with plants. Bottom heat being necessary, first attend to the beds. Whether these are of tan or leaves, the bottom heat being furnished by hot-water pipes, the whole should be removed at least once a year, or insects, particularly woodlice, rapidly increase; the old material also harbours other vermin. All brickwork must be scalded and brushed with hot lime, the wood and iron work with soap and water, thoroughly cleansed, using a brush, keeping the soapy water as much as possible from the glass, which should be cleaned inside and outside with water only. If necessary the wood and iron work may be painted, the roof being made as watertight as practicable. Beds that are chambered—i.e., the hot-water pipes covered with slate or other material, are very much in advance of those surrounded or passing through beds of rubble. Those composed of the latter should be turned over, and any dirt or small parts removed to allow the heat given off by the pipes to penetrate the whole uniformly to the bed. Provide fresh tan in other cases. If wet, turn it occasionally on fine sunny days. With hot-water pipes beneath about 3 feet depth of tan is ample, more will be needed where such aid is not obtained.

Potting Suckers Started in June.—These will soon fill their pots with roots, and must be shifted into larger pots before the roots become closely matted together. Queens must have 9 and 10-inch pots, and those of stronger growth 11-inch pots. Give water immediately after potting, and plunge in a bed having a temperature of 90° to 95°. There is no greater mistake in growing Pines than crowding young plants. They become drawn and weakly instead of having a sturdy base, a condition that should always be secured when possible.

General Remarks.—Attend to the bottom heat of beds that have been recently disturbed or upset by removing or replacing plants, not allowing the heat to exceed 95° at the base of the pots without immediately raising them, as too much bottom heat will disastrously affect plants with fruit or those having the pots filled with roots. Examine the plants for watering about twice a week, and maintain a moist, genial, well ventilated atmosphere. The climatic conditions are now so favourable that Pine plants grow luxuriantly, therefore discontinue any shading such as may have been employed for an hour or two at mid-day, when the sun was powerful through the months of May, June, and July, the plants after this having the benefit of every ray of light, admitting air plentifully when the temperature ranges from 85° to 95°, affording to fruiting plants a night temperature of 70° to 75° at night. Reserve, if possible, more suckers on the stocks for starting at the commencement of September.

PEACHES AND NECTARINES.—*Unheated Houses or Wall Cases.*—The foliage is of a dark glossy hue, and the fruit is swelling kindly, but there is less of it than usual, the result probably of the cold, wet, and sunless weather of last year. The fruit should be so disposed that it has light and air by drawing the leaves aside, and raising it by means of laths across the trellis. Secure the growths as they advance, being

careful to allow space for the swelling of the shoots. Keep the growths thin, every leaf having space for full expansion. Syringe about 7 A.M., the house having a little ventilation constantly, increasing it with the advancing temperature to 75°, or if it is desired to advance the ripening the day temperature may be 80° to 85°, but always with ventilation, and close sufficiently early to maintain that temperature, but not to raise it above 90°. Syringe again in the afternoon about 5 P.M. Timely thinning increases the size of the fruits retained, therefore thin finally as soon as the stoning is completed. One Peach to every square foot is ample, also for the large Nectarines. In small fruit we have twice the weight of stone at a great sacrifice of flesh, and in appearance and quality there is no comparison between well-fed and ill-fed fruit.

CHERRY HOUSE.—The buds are now plump; the leaves, too, will not be capable of much further effort in elaborating sap and storing it in the buds and adjacent wood, therefore any undue excitement will cause the trees to start into growth, which must be guarded against by exposing the trees to the influence of the atmosphere so far as the house will admit, which is the best means of arresting premature growth, to which the Cherry is liable when forced year after year successively. The border must not be allowed to become parchingly dry, but must have a copious supply of water, and if the trees are weak afford liquid manure. To subdue red spider give an occasional washing with the syringe or garden engine. Black aphides can scarcely keep long off Cherry trees, but the leaves and wood, from their hard texture, are not inviting to them, yet if they appear promptly use tobacco water. Trees in pots must be regularly watered and syringed to maintain the foliage in a healthy condition as long as possible.

FIGS.—*Second Crops.*—The fruit of trees started about the new year or before will have the second crop in an advanced state, and it must be thinned if not already done, reserving that at the base of the growths, which as a rule swells and finishes better than near the points. This crop must not tax the energies of the trees too severely if they are expected to afford early fruit next season. Attend regularly to thinning and stopping the shoots, train thinly, and allow plenty of space in the ties for the shoots to swell, stopping the side shoots at about the fifth leaf, but do not encourage spur growths to an extent likely to cause crowding. Afford water copiously through a good surface mulching of short manure. Nothing answers better than sweetened horse knobs. Water or liquid manure will be required according to the extent of the rooting area. The trees in narrow borders may need it every day, those in larger area corresponding thereto. They can hardly have too much water in hot weather, always provided the border is formed of sound material and the roots are active, so as to lay hold of it, and there is drainage to carry off superfluity beyond the soil's retentive power. Syringe forcibly twice a day to dislodge red spider, but with proper feeding and attention there will be no need for insecticides, though nothing seems to prevent scale, therefore remove it with a brush and a soapy solution. Figs like abundance of air; they also delight in heat and light. Admit a little air constantly, increase it early, close early with plenty of moisture, and the fruit will swell to a good size, then a circulation of air constantly will enable the cultivator to produce Figs in perfection.

Fig Trees in Pots for Early Forcing.—Syringe at least once a day, in hot weather twice, affording liquid manure at the roots, and pinching to induce a neat habit in young plants with fruitfulness. Stopping must be regulated by the vigour of the plants and the varieties. Vigorous growers will need to be more closely pinched than those of moderate growth. It is important that the trees have plenty of light, are not crowded, and are well ventilated, to solidify the growth as it is made.

MELONS.—Lately the weather has not been at all favourable for Melons. It has militated against flavour, but plants swelling their fruit have done so wonderfully well, which we mention as we think there is an advantage in slight shade during scorching weather when the fruit is swelling, which the recent somewhat dull weather confirmed very decisively. Frame Melons seem always to place house Melons at a disadvantage during June, July and August. The benefit of a bed of leaves and dung slowly but surely decomposing and evolving a continuous supply of nutriment, the plants not being coddled or stewed, having much more air, therefore have more highly elaborated juices, consequently have a firmer and deeper flesh, sweeter and more agreeable flavour than house Melons at the time named.

Late Crops in Frames.—These have set, or are setting well. Where the plants are luxuriant the growths should be kept thin, or they may refuse to set, or if setting swell indifferently. Some growers have a dread of the knife while the fruit is setting, but we do not hesitate to cut out superfluous growths whenever the necessity arises, and with the best results. Crowding tends to nothing but disaster. The blossoms do not set freely, the fruits swell badly, form large seed cavities, and are deficient in both weight and quality. Copious supplies of water are necessary about twice a week to plants swelling their fruit, with a sprinkling over the foliage at closing time, those in houses being syringed both ways in the afternoon, and good moisture maintained by damping available surfaces in the morning and at noon. Do not neglect to fertilise the blossoms daily of plants now in flower, and examine them frequently for stopping or removing superfluous growths. Keep the atmosphere dry when the fruit is setting and ripening. Maintain a bottom heat of 80° to 85°, top heat 70° at night, 75° by day artificially; in dull weather admit a little air at 75° if the day is likely to be fine, allowing the heat to rise to 80° to 85°, then admit more air, and keep it through the day at 85° to 90°, closing so as to

increase it to 90°, 95°, or 100°. A free circulation of rather dry warm air greatly improves the finish and quality of Melons when ripening.

Late Melons.—If fruit be wanted very late make a last sowing forthwith. Longleaf Perfection and Scarlet Premier are good free setting and swelling sorts, keeping some little time after being ripe. The plants for fruiting in October should be planted at once, it being important that they have a light and well heated structure with those raised from seed now.

KITCHEN GARDEN.

SHALLOTS AND POTATO ONIONS.—Both of these are serviceable, as they may be used as substitutes where Onions have failed, and they possess a flavour much valued by cooks. They are seldom injured by grubs or fail from a bad season. Our stock has reproduced itself for the last ten years, and the bulbs show no signs of degeneration. The present treatment of the bulbs consists in drawing them out of the soil, laying them on a hard surface in the sun to dry, then cleaning and storing in a dry place for the winter.

MORE VACANT GROUND WANTED.—Winter crops may still be increased, but ground for their reception is deficient in many cases, and more vacant places are still wanted. Where fruit bushes from which the crop has been recently gathered have been condemned for removal, do not allow them to remain in the ground until the winter, but clear them off at once, and if the ground is limed or manured and dug over there will then be a fine quarter for winter vegetables. The same remarks apply to exhausted Strawberry plantations.

AUTUMN SPINACH.—Spinach has not been so good during the last weeks as it was previously. It does not like hot dry weather, and this was against its free development and duration, but the time has again arrived when it will do better, and a good breadth should be sown now to furnish gatherings in September and October.

PREPARING FOR MUSHROOMS.—If a good supply of Mushrooms can be secured from October until March they will be more appreciated than during the summer when choice vegetables are plentiful, and wherever horse droppings are available their collecting should begin at once to form beds to bear in October. There is no difficulty in drying the manure now, and it will be ready for the bed by the time sufficient has been collected. If placed in an open shed or under cover anywhere and turned daily that will be sufficient. We do not approve of removing all the short straw from the droppings, but allow a good deal of this to remain, as it binds the bed together better and makes it more lasting and fruitful. If the droppings could only be collected quite free from litter we should be inclined to mix a quantity of chaff with them before making the bed. Our favourite place for beds at this time is in a shed or outhouse, and we never fail to produce Mushrooms in a position of this kind. The beds should be from 15 inches to 18 inches deep, and they cannot be made too firm. Spawn when the temperature is at 85° or 90°, and soil over as soon as it is noticed that the temperature is not inclined to rise above this. At present there are many indications of Mushrooms being plentiful in the fields during August and September, but these will all be over before the beds we wish formed now will be in a good bearing condition.

ASPARAGUS.—The season has suited this admirably. It is years since we noticed the plants so luxuriant as they are at present. Indeed, in many instances they are composed of far too many shoots, and it would be much better for the future and permanent success of the roots if the weakest shoots were cut out level with the ground where they are too crowded. This would throw extra strength into those left; and it would also enable them to mature thoroughly—a very important point not easily attainable where the stems form a dense mass.

COLEWORTS.—These are closely connected with Cabbages, but head more quickly in late autumn, are more hardy, and merit being planted freely as a useful winter vegetable. Some err in planting them too soon. We never place them out until August, and often not until quite the end of that month.

DRYING HERBS FOR WINTER.—A good and varied supply of herbs is necessary in all kitchens. They are in demand all the year round. In summer there is no difficulty in supplying what is required from the beds; but unless some are dried and stored there will be a deficiency in winter. It is the leaves, and not the flowers of herbs that are most valued, and the whole of them should be cut before they flower or seed. The most useful are Thyme, Mint, Sage, and the different kinds of Savories, and good quantities of each should be cut when dry, and be spread out in some airy place, under cover. They must not be placed in the sun, as this will cause the leaves to wither so quickly as to become brittle, and then they will readily fall. When they are so dry that they will not ferment or become mouldy, if tied together, they should be bundled and suspended from the roof of a shed or room; but they must not be used until the open air supplies are destroyed by the weather.

PARSLEY.—Some of the spring-sown beds show signs of being attacked with grub, and if this increases they may be considerably spoiled before the winter; and as it is absolutely necessary that a supply of Parsley be forthcoming, daily efforts must be made to avoid deficiencies. It is always noticeable that grubs are not so injurious in autumn as in summer, and any crop sown now is not likely to be destroyed, even in gardens where the early plants have perished, and a good quantity of seed should be sown at present. If the ground is rich, add a quantity of lime; if poor, add manure and soot, as luxuriant Parsley cannot be produced in hungry soil. This crop will be found most useful in winter, as the close young growths do not suffer so much in severe weather as the long leaves on older plants.

VARIOUS.—Since the heavy rains weeds have made their appearance

abundantly, and to prevent the kitchen garden becoming unsightly in autumn run the Dutch hoe through the soil everywhere. Now that Runner Beans are podding freely gather all off as soon as they are ready, as by allowing them to remain until the seed forms, the later pods will be severely checked. Cut Cabbages that are splitting, that the side shoots may form small heads early. Do not let Cauliflowers become too old before cutting. Keep late Peas well staked. If they once droop over they will fail to fruit freely in late autumn.

PLANT HOUSES.

French and Fancy Pelargoniums.—Plants that have hard, well-ripened wood may be pruned back closely, and stood in a frame until they commence growth. If they are syringed twice daily, and the frame closed early in the afternoon, they will soon start, and no water will be needed at their roots before they reach this stage. When they have well broken into growth the old soil may be shaken from amongst their roots and the plants repotted in a smaller size. The soil may consist of good loam three parts, one part leaf mould, one-seventh decayed manure and sand. Syringe lightly and water carefully until they commence rooting freely into the new soil. The frame may be kept moderately close at first, then admit air abundantly to insure sturdy growth. Young plants that are just rooted in small pots may be placed into 4½-inch pots. Give plenty of air from the first, but water carefully, and they will soon commence rapid growth. Cold frames are the most suitable structures for them, so that the lights can be thrown off after active growth has commenced. Good cuttings may still be inserted in sandy soil, and stood in cold frames until they are rooted.

Roman Hyacinths.—For early flowering bulbs may be potted at once. They can be placed thickly together in pots, pans, or boxes, according to individual requirements. We have found them to succeed well in equal quantities of old refuse soil from the potting shed and good loam, to which is added leaf mould, sand, and a little decayed manure. The bulbs after they are potted should be placed outside and covered with ashes, 4 inches deep. Select for them a position moderately sheltered from the sun, as when fully exposed the soil in the pots is liable to become too dry. Bulbs may be potted at intervals of three weeks until the end of October.

Snowdrops and Crocuses.—Where these are required to flower early they should be potted at once, and not delayed until October and then subjected to undue forcing in spring. Failure is certain to follow such a course of treatment. If home-grown bulbs are prepared for this purpose where they do well, and are potted now, it will be found that the pots are full of roots by the time imported roots can be obtained. These, if never removed from cold frames, will precede those outside in flowering.

Primulas.—All but the latest should be in their largest pots. Be careful to grow them on a cool moist base where they can be protected from strong sun, but where they can enjoy abundance of light. Provide ventilation most liberally to insure sturdy growth. These plants are frequently spoiled by keeping them too close; they draw up weakly, and are a prey to damp in autumn. Give the earliest plants soot water in a clear state, and a little artificial manure on the surface once a fortnight.

Double varieties should also be in their largest pots. These do better close to the glass where they can be shaded from the sun provided they stand on a bed of ashes or gravel.

Petunias.—Plants for early flowering in 5-inch pots next season may be rooted at once and then transferred to 3-inch pots. After they are rooted pinch out the points, to induce them to branch, and grow them as cool and sturdily as possible. Any good varieties from amongst the seedlings that were raised in spring may also be perpetuated by cuttings inserted at the present time. The cuttings of Petunias are liable to damp if they are placed in too warm and too close a structure. A cold frame, that can be kept shaded, will be found the best place for them.

Fuchsias.—Cuttings of these may also be inserted now, and they root freely in cool frames if dibbled thickly into boxes. They should be potted singly after they are rooted, and encouraged to make firm growth by potting them moderately firm and growing them as cool as possible.

Heliotropes.—Bushy plants in 3-inch pots may be placed into 5-inch pots and stood or plunged outside until the end of September. These, if given a light warm structure during the autumn, will flower profusely. Continue to train the shoots of standards and pyramids until they have filled their trellises with sturdy short growths. It is not wise to allow the shoots to extend any great length before they are pinched. The more shoots the plants have, the greater the number of flowers produced.

your readers. The experiment was begun in May, and ended in July. There is no water available near at hand for our bees, so they have to depend mostly upon what is given them. The quantity given each day amounted to 1 lb. 10 ozs., and allowing 2 ozs. for evaporation this leaves 1½ lb. for each stock, or about 30 lbs. for a three-weeks batch of eggs and brood.

Water is required for the secretion of wax and the building of combs, the brood, and the moistening of thick and granulated honey, as well as to keep up the necessary moist atmosphere of the hive. During warm weather much moisture is evaporated from the hive, as much sometimes as 2 lbs. in a night, but it is not confined solely to warm weather, for during the coldest the honey the bees consume is converted into carbonic acid gas and water. In the former case the great bulk of water evaporated is from the excess in the newly gathered honey, and from the natural perspiration of the bees and larvæ.

POLLEN.

It is more difficult to arrive at the exact quantity of pollen required in a hive, as it is used in conjunction with water and honey as food for the larvæ, for the seals of the brood combs, and interstices of the hive along with propolis. But perhaps at least 2 lbs. of pollen is necessary for the brood brought forward in three weeks when the queen is laying about 3000 eggs daily. Whether the above is accurate or not, I know that a strong hive will consume more than 1 lb. of artificial pollen per month during the spring. If we take the three weeks during the height of the honey season, when a strong stock will gather and store 100 lbs. of honey, and carry in 30 lbs. of water, and probably not less than 6 lbs. of pollen, and divide all these materials into globules of three-sixteenths of an inch in diameter, it will give an idea of the laborious work performed by the bee.

PROPOLIS.

This is sometimes carried in in larger quantities than the bee-keeper desires, but never to such an extent as to make it a commercial product. It is sometimes, however, useful as a cement in small quantities, and when gathered from certain trees is fragrant and agreeable.

PUNIC BEES.

It is as yet premature for me to say anything for or against the Punician bee, as I have only seen the young ones beginning to work, but strange to say at the early age of not more than six days old. Of course these young bees are crossed with a drone of the crossed Syrian, but many have the appearance of pure ones, which may be described as being of a dark plum colour with greyish hairs, and the body of a more stubby appearance than some of the other foreign races possess. I should like to know from "A. H. B. K." if this early working of the Punic bee has been observed by him. He has told us of some of the wonderful qualities of this race, but not this point, and, what is most interesting, these youthful bees were at work by 7 A.M. As desired, I have placed one of the queens at the head of a stock, and have it at the Heather, which should be in good condition for gathering honey about the middle of August, after which I will report progress. I cannot say anything definite about their temper yet, but they seem to be mild tempered, as they not only work early, but aired themselves at an earlier age than other sorts. I am favourably impressed.

AGE OF BEES.

I have frequently given my experience of having bees living in August that were hatched not later than the beginning of June the previous year. A more interesting case is now under my notice. A Syrian queen was expelled from the hive at the beginning of March, apparently healthy looking, but exhausted for egg-laying; the healthy look is evidently due to the nourishment given her by her anxious daughters. After the expulsion of the queen a Carniolian was introduced. She, also, after two months was expelled in a similar condition. Latterly one of the Punic queens was introduced, and while I write the three different races occupy the hive, showing Syrian bees that could not be hatched later than in the

THE BEE-KEEPER

NOTES ON BEES.

WATER REQUIRED BY BEES.

I HAVE concluded an experiment as to the amount of water required for the internal economy of the hives during the summer months, and it will perhaps not only interest but astonish some of

last week of April, and probably some of them were hatched in 1888. This is simply another proof of the fallacy that bees live only six weeks. It is to the long life of the bee that we are indebted for the strong hives and large yield of honey, which I hope to say something about in a future issue.—A LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

J. R. Pearson & Sons, Chilwell Nurseries, and 2, Exchange Road, Nottingham.—*Catalogue of Dutch Bulbs.*

Charles Van Geert, Antwerp, Belgium.—*Trade List of Camellias, Azaleas, Trees, and Shrubs.*

Vilmorin, Andrieux & Cie., 4, Quai de la Megisserie, Paris.—*Catalogue of Bulbs, Seeds, and Plants.*

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Judging Picotees (*J. W.*).—Not having a schedule to guide us in this matter we cannot express a definite opinion upon it, but from what you say respecting the wording in the class and that there was no stipulation as to the varieties being distinct, we should think your decision was a correct one. The compilers of schedules are frequently to blame for misunderstandings of this kind. The conditions cannot be stated too clearly, as any kind of vagueness is misleading both to exhibitors and judges.

Grapes Scalded (*Clifton*).—The Grapes you have sent are what gardeners term scalded. The cause and prevention have often been pointed out, the latter especially, on page 54 of the issue of the 18th ult. You probably damp your vinery too late at night, perhaps have no heat in the pipes, and keep the house closed too long in the morning. Leave the top sashes open to the extent of an inch or two all night, and increase the ventilation within half an hour of the sun shining on the house in the morning. The night temperature should not fall far below 70°.

Tuberoses Unsatisfactory (*H. W. G.*).—There is always a difficulty in getting the flowers without the yellow hue, and it is peculiar to some varieties—for we find that grown in sun or in shade the flowers are often marred by the undesirable tinge, and for this reason growers of roots are careful to propagate from the purest white-flowered plants, in which direction a great advance has been made of late, that fine variety, Pearl being originated by careful selection. The Cape and American-grown Tuberoses have purer white flowers than Italian. The shade is not good, neither for the colour, the substance, nor the fragrance of the blooms. The syringing should not be practised over the flowers, but we think the chief cause of what you complain is inherent to the variety.

Crowded Spurs on Espalier Apples (*F. J.*).—With the growth too luxuriant it is not advisable to thin the spurs now, as an excess of sap would probably pass to the adjacent spurs, and push growth instead of forming fruit buds. If, however, the trees are allowed to extend, so that the sap diverted into other channels would be expended thereon, then a judicious thinning of the spurs where too crowded, removing the weakest, and gradually, so as not to cause a check, would tend to the development of the remaining spurs; but it is more advisable to wait until early autumn, when root-pruning being resorted to to check the too luxuriant growth a judicious thinning of the spurs may be practised without danger of the remainder being started into growth; arresting the growth consequent on the root-pruning tends to the maturation of the buds and wood.

Propagating Tropæolums (*S.*).—The variety Fire Ball is very good and most easily propagated. Cuttings inserted in pots of sandy

soil in August, kept moist, close, and shaded for a time to prevent flagging, will speedily emit roots. The young plants may either be potted, one in the centre of a 3-inch pot, or three round the sides of a 4½-inch, or they may remain in the store pots until spring. A shelf in a greenhouse from which frost is excluded will be suitable for them in the winter. When growth commences in the spring the plants may be topped and the cuttings rooted in heat, any required number being provided in a very short time. Until the cuttings are rooted the soil must be constantly moist, but in winter only sufficient water should be given to prevent flagging. Avoid, however, mere surface sprinklings while the roots may be dry below, or the plants will inevitably decay. Choose short-jointed firm growth for cuttings, which may be about 4 inches long, pinching out all flower buds as they appear after the cuttings are inserted.

Hybrid Perpetual Roses for Cutting (*H. R. W.*).—Omitting those you name—viz., La France, Gloire de Dijon, Général Jacqueminot, and Souvenir de Malmaison, we think the following will meet your requirements:—Alfred Colomb, Baionne de Rothschild, Boule de Neige, Brightness of Cheshunt, Charles Dickens, Charles Lefebvre, Countess of Rosebery, Duchess of Bedford, Duke of Albany, Duke of Connaught, Earl of Pembroke, Fisher Holmes, Grand Mogul, Harrison Weir, Jean Liabaud, Louis Van Houtte, Magna Charta, Maréchal Vaillant, Marquise de Castellane, Marquise des Ligneris, Mrs. Baker, Mrs. John Laing, Pierre Notting, Prince Arthur, Sir Garnet Wolseley, Ulrich Brunner, Madame Victor Verdier, John Hopper, François Michelon, and Sénateur Vaisse. Those are all good and free. Others that you may add are Auguste Neumann, American Beauty, Brilliant, Charles Darwin, Comtesse de Mortemart, Countess of Pembroke, Dupuy Jamain, Edouard André, Emily Laxton, George Baker, Abel Carrière, Marchioness of Exeter, Lord Frederick Cavendish, Monsieur E. Y. Teas, Sénateur Favre, Souvenir de Madame Alfred Vy, Reynolds Hole, Marshal P. Wilder, Mdlle. Marie Rady, and Madame Lacharme.

Young Peach Trees (*A. B.*).—The young trees planted last November having made shoots of 5 to 6 feet in length, and being firm and short-jointed, will probably ripen to the extremity; but if there is any doubt of this—the tree having a tendency to late growth and consequent imperfect ripening of the wood—it would be advisable to take out a trench about a foot further from the stem than the roots extended at the time, taking it out below the roots, and leaving it open for about a fortnight, when it may be filled in again, and firmly. This should be done after the wood becomes somewhat firm, from the middle to the end of September being a suitable time for trees in a cool house. If the foliage becomes limp it may be necessary to give water after the trench is taken out to prevent severe flagging, otherwise the foliage may ripen prematurely; but the soil should be kept rather dry, so as to induce ripening, yet with sufficient moisture to ensure the plumping of the buds. With the wood ripe the shoots should not be cut back, unless it be necessary to originate others for furnishing the trees, and then it is best done in spring, when the buds commence swelling. The pyramid trees planted out are manifestly making too much wood. We should cut a trench around them 9 to 12 inches beyond the previous extension of the roots, and as deep as they extend, and leave it open for a fortnight, as above advised, which will check the growth and induce ripening and the maturation of the buds. Pinch the laterals to one joint, and to one of subsequent growth, entirely taking out the point of the shoots at the 18 inches of growth or not stopping, if the shoots have formed the terminal bud—i.e., ceased growing. Admit air moderately in the day, so as to secure a good sun heat, and ventilate to the fullest possible extent at night. This will tend to ripen the growth and induce the formation of fruit buds. If the trees are clean and healthy there is no reason why they should not fruit well another season.

Manure for Strawberries and Cherries (*G. G.*).—Soil that is well drained and enriched with manure from a farmyard, pigstye, cowshed, or stable answers fairly well for Strawberries if it be shallow or deep. The plants, however, soon become exhausted in shallow soil under ordinary conditions of culture, and are only to be retained in full vigour by heavy annual dressings of manure dug in between the rows as soon as the fruiting season is at an end, and by copious waterings of sewage or other liquid manure during the season of growth. In many gardens the available supply of solid manure is so limited that none can be spared for the Strawberry bed; sewage of which every householder has a regular supply then becomes our substitute, the soil between the rows being broken up when the fruit is done, just as it would be if we had manure to dig in, and then the sewage is poured over it frequently till growth ceases in autumn. If planted carefully Cherries answer in soil of ordinary fertility, such as will produce good vegetables without any subsequent addition of manure; sewage, however, may always be given with advantage before the blossom expands and while the fruit is swelling. In poor thin soils stations must be made for the trees, each station being 6 feet square and 2 feet 6 inches deep. Lay a drain of common 2-inch land drain pipes across the middle of the bottom of the hole, and connect it with the nearest branch or main drain to render the roots safe from any accumulation of stagnant water, then cover the bottom of the station with 6 inches of broken brickbats, stones, or clinkers—9 inches would not be too much in a wet low situation—and then fill the hole with rich sweet loam, in which plant the tree. If when the hole is made you find a substratum of gravel there will then be no occasion to use either broken stones or drainpipes, as all superfluous water is certain to pass away quickly. Careful planting involves close attention to details, and that is why we allude to them here. But Cherry trees are

apt to flourish for a few years and then become barren, sickly, and not unfrequently die outright; they must, therefore, be watched closely, and prompt attention be given to the slightest indication of debility, which undoubtedly arises most frequently from exhaustion. The station once abounding with fertility has become sterile, the roots having ramified in it till it has become permeated with them in every direction and lost all its goodness. The remedy is obvious. Make a trench 2 or 3 feet wide and 2 feet deep around the station, fill it with soil similar to that used for the station, and feed the roots with sewage until they have entered the new soil.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*W. B.*)—A light coloured variety of *Crinum longifolium*. (*R. S.*)—1, *Lythrum Salicaria*. 2, *Chrysanthemum segetum*. 3, *Lilium chalcidonicum*. (*M. Croydon*).—1, *Linaria Cymbalaria*, the Ivy-leaved Toadflax. 2, *Epilobium angustifolium*. 3, *Asplenium cicutarium*. 4, *Adiantum tenerum*. (*A. B.*)—1, *Begonia ferruginea*. 2, *Polystichum aculeatum*. 3, *Adiantum pedatum*. 4, *Dracena congesta*. (*A. S.*)—*Oncidium leucophilum*. (*J. C.*)—The specimen is too imperfect to permit the determination of its specific name, but the portion of a flower received seems to be a *Catasetum*.

COVENT GARDEN MARKET.—AUGUST 7TH.

Market quiet owing to the holidays.

POSSIBLE IMPROVEMENT.

THAT the depressed agriculturist is a much advised man is very true, but it is equally true that much of the advice showered upon him is not at all good or worthy of attention. No doubt a certain amount of failure and bankruptcy have followed in the train of depression; that was inevitable, because in every class there are individuals so devoid of originality as to be quite unable to rise to an emergency or to grapple with and overcome difficulties of a novel character. This has been the case of many farmers during the last decade. Most of them were probably very worthy men, perfectly industrious, sober, and honest, and doing their utmost to stem the tide of failure which swept over their affairs with a force that they were unable to resist. Evidence of such failures has been and is still present with us in the numerous vacant farms that have fallen upon the hands of landlords. This is indeed stern reality, and we do well to inquire were the failures inevitable, and could not they have been avoided?

Not by any means difficult is it to answer that they were inevitable in almost every instance, simply because of the ignorance and incapacity of the sufferers. Most of them had been corn growers all their lives, other branches of farming received little attention from them, and when corn fell in value they continued growing it for the simple reason that their habits were fixed and they could turn to nothing else. Meanwhile the demand for dairy produce was steadily increasing, complaints of the inferior and changeable character of home made butter were loud and general, the foreign producer saw and seized his opportunity, and the butter merchants' demand for a regular and adequate supply of butter of a high and fixed quality was ably met by the farmers of the Continent, Denmark taking the lead, followed by France, Germany, and Holland. Importations from other countries are also considerable, the total amount lost to the British farmer in 1888 for this article alone being £8,902,193. We may as well add to this £4,542,278 for cheese, and £3,077,109 for eggs, or a grand total of £16,521,580 paid to the foreign producer in 1888 for three articles of farmyard produce, most of which might just as well have been expended upon home produce, and doubtless would have been had it been forthcoming in suitable condition to command the markets. But we have supinely suffered the foreigner to wrest so large a portion of trade from us, and he will not lightly be driven from the field now. To compete with him we must offer a first class article at low rates, see that the quality is of uniform excellence, guarantee a regular supply, and so strive to establish a feeling of confidence between producer, salesman, and consumer. It is upon such principles that trade is built up and business connections formed; the farmer's part in it is surely patent enough.

Perhaps the most striking proof of the truth of these remarks may be found in the failure of so many Essex farmers. Close to the huge metropolis, with the endless wants of its teeming millions, this home county should be one of the most prosperous in the kingdom. This self-evident fact induced Scotch farmers to turn their attention to it. They found plenty of vacant farms offered at very low rents within twenty miles of London, and they hired them. But instead of attempting to grow corn almost all the land was brought under a system of alternate husbandry, and laid down in temporary pasture for at least four years, and at the end of that time, if the layers appeared sound, they were left for another two years. The expenditure for labour was thus kept down from the first, milk and hay found a ready sale in London, any quantity of London dung was available for the land, so that the poverty

brought upon it by a generation of bad farming could soon be corrected. Thus by the exercise of sound judgment, industry, economy, and thrift, the new tenants are successful and prosperous. They adapt themselves to circumstances, cause their farms to serve local requirements, produce articles for which there is a speedy sale, a sure and profitable return. The price of milk is undoubtedly low, but they contrive to make it pay; and even where cows are not kept for milk the farmers are prosperous, for it need not be questioned that men so alert and keen would turn their holdings to account for every crop that bids fair to be profitable.

We may be told that all farmers could not meet their difficulties in this manner; and we agree. But they could assuredly do better everywhere than continue using all their land for the cultivation of corn. It is that of which we complain, and we have done so to good purpose among the tenants of small farms, who, if only they can be induced to see that their interest lies in the production for sale of mutton, pork, poultry, and dairy produce, rather than corn, are quite certain to be prosperous if they conduct their business with due care and skill. They may grow some corn, but most of it should be for home consumption by the animals of the farm.

WORK ON THE HOME FARM.

Recent showers have done much to ensure the safety of late Swedes and white Turnips. The rain has also done much good to early roots and all green crops. Thousand-headed Kale and Cabbages are full of vigorous growth, especially where a dressing of nitrogenous manure had been applied before the rain, which dissolved and washed it well down to the roots. An abundant store of fodder and roots is now certain for use next winter, and all who can hold over the lambs for hoggets should do so, both in view of profits from them and for the sake of the land, a large proportion of which ought always to be folded with sheep every year. When lambs are purchased as stores for hoggets it should be done with a clear grasp of one's intention, for without a definite purpose it is easy to make a mistake. If, for example, we require hoggets to go out to the butcher before Christmas, then we should secure forward lambs which have been well fed; and we must continue the use of lamb food, Waterloo cake, or crushed oats and peas or beans. But if hoggets are not to be finished till next spring, then lambs which have not been forced on by high feeding will be best; and they will require nothing besides grass at present. The appearance of forward lambs in high condition is so tempting that it is quite necessary to caution beginners about the purchase of such animals, for if the high-feeding is not continued there is a speedy falling off in condition, involving much vexation and a certain loss.

Harvest will now soon be general, for all corn has ripened very fast, and not a day must be lost in saving every crop as it becomes ready. Much Wheat had the grain ready for reaping while yet the straw was quite green, and there is so strong a growth of weeds or layers among the straw that some caution is necessary. Before all things the corn must be saved; and it will not answer to leave it so long as to run risk of its being shaken out of the ears. As a rule Wheat should be reaped as soon as the grain becomes so far matured as to yield no juice when squeezed hard. Barley must be left till quite ripe, and then it cannot be got to the stack too quickly. The test for Oats is precisely similar to that for Wheat, and early cutting is advisable, as ripe Oats are easily shaken out of ear. Beans may be cut when the leaf begins to fade, and the beans become "black-eyed." Peas should always be cut quickly after the seed is fully developed, and be laid in thin wads to facilitate ripening and turning.

THE CROP REPORTS.

THE reports on the crops which we publish to-day (August 5th), taking them all round, are about the most favourable which it has ever been our pleasure to chronicle. They were collected between July 26th and August 1st. The abstract tables given below represent the crops of England only, and we believe that the figures we give fairly indicate their general condition:—

CORN CROPS, 1889.

	Wheat.	Barley.	Oats.	Beans.	Peas.
Over average ...	100	51	58	27	26
Average ...	83	100	97	42	54
Under average ...	18	49	56	56	37
Total ...	206	200	211	125	117

PERCENTAGES, 1889.

	Wheat.	Barley.	Oats.	Beans.	Peas.
Over average ...	48.6	25.5	27.5	21.6	22.2
Average ...	42.7	50.0	46.0	33.6	46.2
Under average ...	8.7	24.5	26.5	44.8	31.6
	100	100	100	100	100

HAY, POTATOES, AND ROOTS, 1889.

	Hay.	Potatoes.	Turnips.	Mangels.
Over average ...	137	102	93	82
Average ...	22	63	88	73
Under average ...	1	15	17	31
Total ...	210	180	203	186

	PERCENTAGES, 1889.			
Over average ...	89.0	56.7	43.3	44.1
Average ...	10.5	35.0	43.3	39.2
Under average ...	0.5	8.3	8.4	16.7
	100	100	100	100

It will be seen that the figures represent all the crops except Beans and Peas as more or less generally above average, while Peas are not very much below. In fact, we may say that, approximately, our returns represent Barley, Oats, and Peas as average crops, Beans as under average, and all the other crops as considerably above the ordinary standard.

A comparison of this year's tables with those of last year, given below, will show the great superiority of the present season in general productiveness:—

CORN CROPS, 1888.

	Wheat.	Barley.	Oats.	Beans.	Peas.
Over average ...	15	86	75	45	35
Average ...	49	109	100	55	53
Under average ...	164	52	75	77	89
Total ...	228	247	250	177	177

	PERCENTAGES, 1888.				
Over average ...	7	34.8	30	25.4	19.8
Average ...	21.5	44.1	40	31.1	29.9
Under average ...	71.5	21.1	30	43.5	50.3
	100	100	100	100	100

HAY, POTATOES, AND ROOTS, 1888.

	Hay.	Potatoes.	Turnips.	Mangels.
Over average ...	140	128	130	88
Average ...	68	54	83	85
Under average ...	53	55	39	61
Total ...	261	237	252	234

	PERCENTAGES, 1888.			
Over average ...	53.6	54.0	51.6	37.6
Average ...	26.1	22.8	32.9	36.3
Under average ...	20.3	23.2	15.5	26.1
	100	100	100	100

Barley and Beans are the only crops which come out worse for 1889 than for 1888, while all the other crops show up considerably better. The comparison is most quickly made by noticing the percentages of under-average returns for the two years. As usual, there is more doubt about the root crops than any others, for the simple reason that they have not nearly arrived at maturity at this season of the year; but we take it to be a good sign that our correspondents express much less hesitation in estimating these crops on the present occasion than they expressed last year.

Farmers in the early districts have enjoyed splendid weather for the beginning of their harvest, and we hope that this is but an earnest of what is to follow.—(*The Agricultural Gazette*.)

REMARKS.

28th.—Fne bright day; spots of rain in evening.
29th.—Dull early; fine day, but close, especially in afternoon and evening.
30th.—Dull early; bright warm day.
31st.—Bright and warm.
1st.—Warm, hazy, and oppressive.
2nd.—Fine, and generally bright.
3rd.—Wet from 3 A.M. to 1 P.M.; fine, and frequently bright in afternoon.
A week of warm summer weather. Temperature 6° above that of the preceding week and 4° above the average.—G. J. SYMONS.

POTATOES FOR PLANTING.

GARDENERS in the exercise of their calling must look well ahead, and in no one particular is this more necessary than in the case of saving Potatoes for planting during the next season. In most instances a considerable portion of the kitchen garden has to be devoted to Potato culture, and whether the crop prove a success or not very much depends upon the quality of the sets used. If they are of all sizes, some of necessity being cut and others perhaps being really too small to plant, an uneven weakly haulm is almost certain to result. Sometimes very slightly diseased tubers are saved, and these do not decay till after they are planted and have formed some very weakly haulm. The greatest and most generally repeated mistake is the practice of saving all the crop in one heap, the largest tubers being used as required and the remainder planted. When the "ware" Potatoes are thus stored with the planting sets the former must be covered and otherwise favoured at the expense of the latter, frequent exhaustive sproutings being the inevitable result. It cannot be too often impressed on the minds of the inexperienced that a tuber intended to be planted in the next season ought not to produce but one, or at the most two, strong sprouts, these being short and firmly attached to the set when it is put out. The loss of the first strong sprout is not of so much importance, though it should be prevented, if possible, in the case of most of the round varieties; but when the Ashleaf and Lapstone sections in particular are caused or allowed to sprout prematurely this has a most weakening effect, and a light crop is almost certain to be the result of this careless treatment.

Whether or not "a change of seed always pays" it is not my intention to discuss, and will merely remark that, according to my experience, it is not generally so advantageous a measure as some would have us to believe. I have hitherto found our own well selected and properly cared for sets answer better than any brought from a distance, the new varieties especially rarely succeeding satisfactorily the first season they are tried. Our practice therefore is to save as many planting tubers as we can find room for, or ample for our purpose, and to keep these apart from the ware or those intended for consumption. All are sorted over according as they are lifted, the smallest finding their way to the labourers' pigs, the medium-sized being selected for planting, and the rest stored for either boiling or baking, the larger sizes being much in demand for the latter purpose. Although we do not save very rough tubers for planting, I do not attach very much importance to the theory that the finest crops of Potatoes are to be obtained from the best formed tubers, as it frequently happens that the latter produce a great per-centage of malformed tubers, and on the other hand I have seen abundance of Potatoes fit for exhibition result from rough sets. Much in either case depends upon the nature of the ground, the manure used, and the cultivation accorded. What I wish most strongly to urge is the necessity for saving abundance of planting tubers that will not require to be cut, unless to hasten decay, so as to be well prepared for the next planting season.

Especially is it wise to save plenty of the best early Ashleaf varieties, as these can only very rarely be bought so good as they can be saved on the place, whereas most of the later varieties, in addition to being cheaper, are, as I have shown, not so much weakened by the loss of first sprouts consequent either upon thick storing or travelling. One reason why the invaluable Ashleaf

varieties are not more largely grown by amateurs generally, as well as those in charge of numerous small gardens, is the fact of the seed being both scarce and dear. Where double-cropping must be closely resorted to the Ashleafs are particularly valuable, these forming comparatively little haulm, and in addition mature early. Instead, therefore, of using these up so closely as usual let me advise that a much greater proportion of tubers be saved for planting, and when once matters are got into a good working groove there will be, disease permitting, less need of self-denial when the time again comes round for lifting and storing.

I believe there are fewer collections of Potatoes grown than formerly, and that, too, in spite of the great increase in the number of varieties available. This is as it should be, for collections as a rule are unprofitable, only the enthusiast tolerating them. In addition to causing much extra labour a constant change on the table is anything but pleasing to those who rightly prefer to have a long succession of the best variety in season. It is, however, only by repeated trials that the varieties best adapted to any particular soils can be found, but when these few are selected—for after all that may be said or written there are only a limited number of gardens where a considerable number of varieties succeed satisfactorily in every way—let the rest be discarded. We find it pays best to grow only a few varieties, and these most extensively. The weeding out should be done now, and not after the sets have cumbered the store room all the winter.

Not a few planting sets are forked out of the ground quite sound only to take the disease while laying on the surface, either to dry or, worse still, in order to conform to the fallacy that "greening" is either necessary or beneficial. Greened tubers may be stored apparently sound, yet with the disease in them, and as previously pointed out, may even be planted without its being detected. Those who are wise will not trouble to first green their tubers prior to storing, but will get them under cover as quickly as possible, especially if the weather is dull and showery. There are so many diseased Potatoes this season that it will hardly be possible to avoid storing a few of them, and there is all the more reason therefore to avoid courting disaster. It is when the tubers are newly lifted they are most susceptible of disease, and there is little danger of their taking it in airy open sheds or rooms where they are placed for the winter. If kept rather close, or in large heaps, the Ashleafs especially will sprout badly long before midwinter, and all ought to be stored as thinly as possible; a single layer, whether in shallow boxes, trays, and baskets, or in latticed benches, is all that should be formed. The sooner the Ashleafs are set on end, thickest end uppermost, the better. This, however, is work for wet weather, and may safely be deferred for a few days or weeks.

—W. IGGULDEN.

SEASONABLE NOTES ON TOMATOES.

A GROWER in Wales told me one day last week that last year he sent 30 tons to market, and at present he had every prospect of increasing this during 1889 to 40 tons. Ten years ago Tomato culture was an unheard-of experience in the garden in question. The owner further said he could readily dispose of 100 tons a year, and that he knew one salesman who would contract for the whole at an average of 1s. a lb.

The Tomato disease fortunately is far from general, but when once it is established in a place it is difficult to eradicate. Not having to contend with it I have no opinion of my own to offer as to its removal, but a friend recently informed me that he had to deal with a very bad case, so bad, indeed, that his resolution was either to kill or cure, and he thinks he has effected the latter by very stringent means. The house was a large one, over 100 feet in length, and a quantity of sulphur was placed in saucers along the gangway. The sulphur was kindled and allowed to burn until the house was so full of fumes as to compel the exit of those in

charge. They took the dishes with them and allowed the fumes to escape through a closed house, and from that day the plants have made fresh leaves which have shown no trace of being diseased. The fruit formed previous to this operation continued to swell, and much of it has since been sold at 1s. 6d. a lb. I can rely on the testimony of my informant, and the plan is so simple and effective that it may be tried wherever necessary.

In June last we had a good crop of Tomatoes on the back shelf of a Pine house. The distance from the soil until they touched the glass was not more than 3 feet 6 inches, and being well in the light they naturally produced a thickly formed crop, but I could see we should not secure many more from them after they came in contact with the glass, and when the fruit had been secured up this length the plants were cut down to the ground or soil, but they soon emitted fresh growths. One of these was allowed to grow up from each root, and at the present time they are bearing as good a crop as in the first instance. They were not stimulated until the fruit had formed the second time, as to have done this at first might have induced the wood to be long-jointed and sterile, but since the fruit appeared they have been top-dressed, and this has given them additional strength.

Not knowing what the summer of 1889 was likely to be, wet or dry, dull or sunny, and having a lively recollection of the complete failure of the open air Tomatoes in 1888, we prepared to avoid this again by having some robust plants in 10-inch pots by the end of May, and these were plunged at the bottom of the fruit walls, and the shoots tied up to the wall. These produced ripe fruit by the middle of July, and would have done so before the end of the season in spite of the weather, but others were planted out in the usual way, and although they have not produced ripe fruits they are bearing quantities of green ones, and indicate that they will soon prove remunerative, and from all I can see and hear this will soon be the case with open air Tomatoes generally. The warm weather during the hay harvest suited them admirably, and they will benefit by it to the end of the season.

I am of opinion, however, that the failure of Tomatoes in the open air is very often neither the fault of the weather nor of the plants, but is directly produced by the neglect of the cultivator. I have known many cases where considerable attention was devoted to raising the plants, or a good deal of expense incurred in buying them, and they were planted out with an amount of care which suggested that they would have proper attention throughout, but before a ripe fruit had been gathered the plants had become crowded with superfluous growths. An instance of this kind came under my notice in two different gardens in Carmarthenshire last week; many of the shoots were carrying fruits, but they were small and deformed for want of air, and, in short, a capital crop had been ruined. Their owners were under the impression that once planted they had only to wait a little while and then begin gathering the fruit. They were sorry for their mistake, and would have done all possible to rectify it; but although they might have thinned the shoots and trained those remaining so as to expose them fully to the sun and air, the plants would fail utterly to produce the satisfactory crops they most assuredly would have done had they been trained from the first.

Those who complain that their open air Tomatoes are in danger of failing must see at once that they are not suffering from the same cause, and the evil should be rectified as far as possible without a day's delay. It is better to have one or two dozen good fruits from a plant than try to have scores which never become really fit for the table. Large size and fine form are not the only points necessary to constitute a perfect Tomato, as flavour is the most important point of all, and those who care to test a few varieties in this respect will be astonished at the excellency of some and the deficiency of others. As to very late Tomatoes they can only be secured in fine condition under glass, and if cuttings are rooted now, grown in pots, and placed in warm corners in October in much the same way as the earliest plants are treated, there need be no scarcity of fruit of the best description until Christmas or much later. We all know the trouble that many take to secure late or winter Cucumbers, but Tomatoes might be secured at the same time with much less expense and anxiety, and they would be more valuable in the market, and equally as much appreciated on private tables. It certainly does not pay to keep old Tomato plants until the last fruit has been gathered, and if they were cleared out when nearing the end young vigorous plants would soon afford another supply.—J. MUIR, *Margam Park, S. Wales.*

THE SHIRLEY POPPIES.

A WISE man once said there was nothing new under the sun, a statement that often contains more truth than appears on the surface at first glance. Although the Shirley Poppy cannot, per-

haps, be traced back to the reign of that distinguished monarch, I can at least trace one back for a quarter of a century that is so much like it as to make no difference, unless it be that I consider it superior to the Shirley strain, inasmuch that they not only represent every shade of colour as the Shirley ones, but many of them are as full hearted as a Rose. I first saw it about five years ago in a garden in Scotland. The lady told me she had gathered the seed two years previously in a churchyard in Spain, and in consequence called them "Spanish Poppies," and was most particular that no one should get seed of them, so that she would have something in her garden that no one else had, something at once the delight and the envy of friends and visitors. I was very much surprised, on account of this conservatism, to find the same Poppy blooming in the garden of a farmhouse on the estate, on the opposite side of the river certainly, but within a mile of the lady's garden! Being interested in the matter I inquired of the farmer how he came by the Spanish Poppies. He said "Spanish?" we call them Australian, having had the seed originally from a friend of ours out there some one and twenty years ago, and have always saved a pinch of seed annually ever since."

I sent a pinch of seed to a leading firm of London nurserymen last spring for comparison with the Shirley, and they write me that while the foliage differs slightly, and some of the petals are spotted black at the base, they cannot otherwise observe any difference between the two strains. At the same time I ought to state that the seed I sent them does scant justice to their true beauty, as a hen with a brood of chickens had nearly deprived me of Poppies, seed and all.

Of course the fact that there was one in existence does not detract one iota from the credit due to the Rev. W. Wilks for bringing his one before the public.—H. C. W.

PRUNING OR NOT PRUNING FRUIT TREES THE FIRST YEAR.

MR. GEORGE BUNYARD is a busy man, but if he was busier between March and July, the period elapsing before his reply to my remarks on the above subject, than I have been since that reply appeared on page 16, July 11th, I should be sorry for him if the pressure were not to his advantage. I hope he may have sufficient leisure now to read my somewhat tardy rejoinder. The remark to which I took exception in Mr. Bunyard's generally excellent paper read at Chiswick last October was this, "No Apple should be pruned the first year of planting." It was a precise dictum without any qualification, and as such I was unable to accept it. Nor am I now. I said in my article I could understand particularly well rooted standard Apples, such as Mr. Bunyard I thought had in view, growing well without the previous summer shoots being pruned, but I could not nor cannot see how it is possible for trees of a contrary character—that is, those with large tops and few roots, of which I have seen so many planted—to grow as well, or nearly as well, as if the shoots were shortened in somewhat the same proportion as the roots were in the process of removing them from the ground. Thus I made an exception, but Mr. Bunyard made none, though in his reply to my observations he now makes exceptions, and the fact of his doing so proves, if not the necessity, the reasonableness of my original dissension.

I have not the least doubt that when Mr. Bunyard advises on trees of his own raising, or of others which he examines, his advice will be good; but when he was speaking at Chiswick his remarks applied to all trees, ill or well rooted, that were to be planted during the then ensuing season; and laid down the rule simple, forcible, and inflexible, that "no Apple" should be pruned the first year of planting. In the discussion in this Journal he had one adherent, a very good one I readily admit, in Mr. Arthur Young, but I am not prepared to admit that his experience is greater than that of the majority of others who took a different view of the case. With one exception the gardener having perhaps, as such, the greatest experience of all of us (Mr. G. Abbey). I have seen the trees on which their remarks were founded. I do not include Mr. Kruse in the category of gardeners, but judging by his writings he is a most careful and successful fruit grower, whose plantations I hope some day to see. There may be trees in Kent that equal at the same age some of those referred to which were pruned the first year, but I have not seen them, though I have seen thousands in the famed county.

The thrifty orchard to which Mr. Young pointed as evidence of the soundness of non-pruning the first year he did not plant. I saw the trees before he did, and they were good at the top and no doubt at the roots, for I believe they were from Messrs. Smith's of Worcester; and further, if my memory is not wholly at fault,

some at least of the strong shoots were shortened the first year. Mr. Young may have planted other trees since; but be that as it may, and however well they have grown, his experience of necessity falls short of that of others on which I am content to rely in support of my own, which is not so short, perhaps, as I could wish in this pleasant world full of pleasant friends, of whom Mr. Bunyard and Mr. Young are among the most esteemed.

I think it was in 1847 when I saw the first experiment made for testing the question of pruning and non-pruning the first season; and the last was during the present year. I cannot say how many times I have tried the two methods during the interval of forty years, but often enough to satisfy me that the former plan is, as a rule, the better. I know quite well that when the branches are left untouched the first season, and make scarcely any growth, that the same branches if cut back the second season will push fresh growths from the base even if no buds are visible. Old trees do that when cut down for grafting. The second year's growths may be good, and they ought to be, but a year is lost all the same, as I will show from examples.

A gentleman procured a number of Apple trees from Mr. Bunyard last year. They were good trees. Though his experience was sufficient to guide him rightly, he yet read attentively Mr. Bunyard's paper and my comment thereon. It may not have been in consequence of what either of us said, and probably was not, nor does it matter whether it was or not, but the fact remains that he did not follow Mr. Bunyard's advice with Mr. Bunyard's trees, and is now delighted with their condition. The number of branches is doubled, or more, and they are as strong as is desired for ripening, with fruit buds forming on the lower portions—last year's wood. By the autumn good heads will be formed, and a good "framework" for fruitful trees provided.

Another planter of equally good trees, but in better soil, did not shorten the branches. I have been to see both sets of trees, and the number of branches of the latter remains the same as when planted, and not appreciably thicker. One or two have pushed shoots 2 or 3 inches long, but the majority only produced a few small leaves, the root force being inadequate to do more than that. The branches must be cut back in the winter, as Messrs. Bunyard and Young advise, or the trees will be ruined, and next year they will not, and cannot, produce more and better growths than those above referred to of the first year pruned trees. Is there not by comparison a year's growth gained in one case, and a year's growth lost in the other?

If the two sets of trees were dug up in the autumn and sold by auction in Maidstone market, those first alluded to that were pruned after planting would realise at the least thrice the price of the non-pruned, indeed some of these would not be saleable, for they are dead, yet the same price was paid for all nine months ago. I am meeting Mr. Bunyard, I hope fairly, on the ground of practice, and this as borne out by trees that were his own last year shows that there is at least one exception to the soundness of his doctrine as represented by scores of trees, and these not growing in a garden but an open field. It would almost appear from this experience that his trees are better than he thinks they are, and will do more than he expects of them.

I can quite understand there may be a difference in the growth of field and garden trees, also that in the former case, where the soil is heavy and cold and the trees roughly planted, the first growth after the first year's pruning might not be strong and matured at the end of the season, but "pipy and sappy;" but on the other hand if not shortened some might be dead. Mr. Bunyard now says his remarks were "never intended for garden practice." Had he said this at the first I should not had the same scope for comment; but his statement covered all sorts of Apple trees and all sorts of practice, and I am free to confess that I had not in my mind roughly planted trees in fields, but rather trees well planted in land fitted for their reception. My experience has been gained from good workmen and good workmanship rather than bad, and this I had in view when first writing on the subject. Nurserymen have to deal with all sorts of people, and some of them no doubt commence spoiling trees as soon as they receive them by bad planting in bad soil. Mr. Bunyard has found that for them his plan is the safest. Thus reduced I have no desire to say anything against it, but I am not prepared to admit that what is best for bad workmen and bad soil is also best for good workmen and good soil, but believe in as much skill as can be acquired being turned to account, and the best made of immediate circumstances.

I quite comprehend Mr. Bunyard's references to "hospital trees," and also know that his method of treatment is not universal. He adopts the plan he finds best; others do the same, though not in the same way. This is a question on which doctors differ, and the millennium when they will agree is, I suspect, a few years distant.

I cannot follow the *rationale* of Mr. Bunyard's advice to leave the branches of comparatively fibreless Apples on Crab stocks unshortened after planting, while those on Paradise stocks, "full of roots," may be pruned. Most persons would, I think, be inclined to reverse the proposition, though Mr. Bunyard thinks "both benefit by being uncut the first year." The majority of experienced gardeners do not, nor does Mr. Kruse. I called at Chiswick in the spring, and observed a number of young Apple trees recently planted. They included several varieties on different forms of the Paradise stock. Mr. Barron is not a great talker, but he has as clear ideas as most men on the subject of fruit culture, and his work as represented by hundreds of trees of various shapes in the garden is more forcible than words. It was not necessary to ask if he was a believer or otherwise in the practice of pruning trees soon after planting, for the trees were pruned. It does not follow that he will prune them similarly next year, as they may produce a sufficient number of sufficiently strong branches the first season, instead of waiting for the second, for the foundation of fruitful trees.

Spring, when the sap is moving, is the time to shorten the branches of newly planted trees. Mr. Young once said he could not understand this. I thought it best to leave him to "think it out," and when he says he is unequal to the task of solving the problem I will endeavour to come to the rescue. I think I have said enough at present, and thank Mr. Bunyard for his useful and suggestive communication.—J. WRIGHT.

JOTTINGS.

POPPIES.

THE variable character of the annual Poppies has been taken advantage of by cultivators, but not perhaps to the fullest extent possible, or our cornfield Poppy (*Papaver Rhæas*) would have been the subject of more experiments. Even in a wild state it varies considerably both in the size, colour, and markings of the flowers; in some the flowers possess the dark spots in the centre as described in most of the text books to British botany, while in many others they are absent, and this seems to be almost exclusively the case with the plants in my district. This Poppy is not strictly a native of England, but is regarded, in common with all the others found in this country, as a colonist, as might be expected in the case of a plant that produces seed so freely and is so closely associated with cultivated plants. It is widely distributed, being found throughout Europe, northern Africa, parts of Asia to India, and even apparently to Japan. At least, it has been an inhabitant of Japanese gardens for a considerable time, as some years ago M.M. Vilmorin & Cie. of Paris introduced from Japan a series of distinct double and single varieties which were placed in commerce under the name of "*Coquelicots Japonais Pompons variés*," *Coquelicot* being the French designation of *P. Rhæas*, and familiar to ladies in this country as the title of a fashionable shade of colour. These Japanese varieties have been increased in number and diversity, and now constitute a pretty group, the double forms in particular being notable for their compact habit and neat richly coloured flowers, constituting, when well grown, really handsome garden plants.

There is also a double form of *P. Hookeri*, which has been grown at Chiswick as Hooker's Double, having good sized dark red full flowers and freely produced. Like the Shirley Poppies it was accorded three marks by the Floral Committee, and will, no doubt, prove useful, as one strong point in favour of the double Poppies is that they last much longer than the others, and, though wanting in the gracefulness of the singles, their durability compensates for this defect.

Before quitting these a little experiment may be noted, though the results cannot be given. The charming perennial Iceland Poppies, *Papaver nudicaule* varieties, are well known and equally appreciated both as garden plants and for cutting. Crosses between these and the Shirley Poppies, either with a view of procuring yellow annual forms, or preferably with the desire of transferring some of the colours in annuals to the Iceland Poppies, ought to give something of an interesting character if the cross could be effected. With the object of testing this a plot was devoted to plants of the two types named, leaving them in a great measure to the chances of insect cross-fertilisation; but in a number of cases also the flowers were fertilised with pollen of the other type. It is almost needless to say that abundance of seed was secured; but of course it is as yet impossible to say whether the cross has really been effected or not, nor can we imagine what the results will be, though we hope for something good.

One other species of the *P. Rhæas* type remains to be mentioned—namely, *P. umbrosum*, which displayed its charms in the

Chiswick Garden to the best advantage, and it also was honoured with three marks. It is one of the most brilliant of the whole group, as the flowers are of considerable size, of the richest scarlet, which is rendered even more intense by the shining black blotch at the base of each petal. In beds this Poppy has a grand appearance, and the colour renders some of even our brightest plants dull in comparison. Autumn-sown seeds yield plants that should be strong little specimens by the following spring, as it is quite hardy in most southern and midland districts, like other natives of the Caucasus, and in June and July it will yield its flowers liberally.

Turning to another type of Poppies, the varieties produced by *Papaver somniferum*, we have numbers that have taken a place in gardens, though not distinguished by the rich colours of the preceding, and in fact altogether less pleasing. *P. somniferum* is familiar as a wild plant both in England and other European countries, yet it is unquestionably an introduction very widely diffused. It is readily recognised by its upright growth, hard deeply cut glaucous leaves, and large flowers, white with purplish spots at the base, and in cultivated forms the colouring ranges through some very peculiar shades of purplish mauve and dull crimson. By far the best of the group is *Danebrog*, which is said to be a hybrid between *P. somniferum* and *P. umbrosum*; it has scarlet deeply serrated petals and a silvery white centre, a peculiar contrast but very effective. *Mephisto* is a companion to the last named, also with scarlet serrated petals, but purplish black central blotches take the place of the white ones in *Danebrog*. Both these received three marks, as did also the following of the same group:—*Steinforth*, pink and red, dwarf; *Rawson's Fringed*, taller, red and white, deeply fringed; *Snowdrift*, double white, fringed; and *Double Pæony*, white, large flower, not fringed.

THE BEST ANNUALS.

Most of these are so well known that a list of the sorts selected by the Committee will suffice if given at the conclusion of these notes; but there are some that deserve a little more attention, and first amongst them is the charming Algerian annual *Linaria reticulata aureo-purpurea*. Several of the annual *Linarias* are extremely graceful and bright flowered plants, far more worthy of a space in the garden than dozens of weedy occupants. *L. maroccana* and *L. bipartita* are both capital plants, but there is something very charming about *L. reticulata*. It is not so useful for massing as some other annuals, but its neat richly coloured purple and gold flowers in slender elegant spikes are well fitted for cutting, and look excellent in small glasses. This was evidently a general favourite with the Committee, as nearly everyone present gathered a specimen.

Another plant which stood out conspicuously by reason of its distinct appearance was *Bartonia aurea*. It is a Chilean member of the peculiar and rather forbidding *Loasa* family, growing about 12 to 18 inches high, and producing its rich golden flowers in profusion. It is not one of the common garden annuals by any means, and perhaps it has lost favour with some because it has not had a suitable situation. The fact is it requires a rather warm position and light rich soil; it is useless attempting to grow it in wet, heavy, and cold soils with the object of obtaining it in the best condition.

For its rich blue flowers *Eutoca viscida* is worthy of a place in the best collection, even though its charms are of short duration. Blue flowers are not too numerous in gardens, and such a blue as this is as satisfactory to those who appreciate pure bright shades of colour as the lovely and unrivalled *Salvia patens*. This *Eutoca* is one of the many beautiful annuals obtained from California that can be grown here with good results, and plants are readily raised either from spring or autumn sown seed.

Two useful members of the annual *Compositæ* are *Coreopsis coronata* and *C. Drummondii*, both of which were well represented in the Chiswick trial. They are easily raised from seed, and their bright golden flower heads, borne on long slender graceful stems, are capitally adapted for cutting. The value of these plants is by no means generally recognised in gardens, but some of those engaged in floral decoration have discovered their merits and utilise them accordingly. At the Royal Botanic Society's Evening Fête this year it was interesting to note what a large quantity of these flowers were employed in different exhibits, but especially in those from Stoke Newington, where Mr. Chard has employed it for some time in various ways. These annuals are amongst the few that really pay for cultivation in pots, as they can be had in flower much earlier under glass, and the plants are well suited for arranging with others in a conservatory, or wherever groups are required.

Platystemon californicus is one of the Californian allies of the Poppies with small Buttercup-like flowers, of a creamy yellow colour,

and having a central tuft of stamens. Singly the plants are too small to be very conspicuous, but in patches they look well, and though perhaps the plant is rather more delicate than some of the annuals usually grown, it is worth a warm, sheltered, and moderately dry position, where with a little care it will succeed.

The other annuals distinguished by the Committee were as follows:—*Silene pendula compacta*, *Candytuft*, *Dunnetti* (deep purple), *Eucharidium grandiflorum*, *Silene Armeria*, *Leptosiphon roseus*, *Campanula macrostyla*, *Nolana atriplicifolia*, *Limnanthes Douglasii*, *Kaulfussia amelloides*, *Asperula azurea setosa*, *Linum grandiflorum*, *Mignonette Covent Garden Favourite*, *Gilia linifolia*, *Gypsophila elegans*, *Eschscholtzias*, *Viscaria cardinalis*, *Clarkia integripetala*, *Erysimum arkansanum*, *Schizanthus pinnatus*, *Lupinus nanus albus*, *L. luteus*, and *Malope grandiflora*. The Stocks and some other plants were examined at a subsequent meeting, but the above selection will be some guide to those who wish to sow a selection of seeds this autumn, as they were chosen for their general qualities of habit or flowering.—L. CASTLE.

CANKER IN FRUIT TREES.

I AM glad that "W." and Mr. Hiam do not permit the question of the cause of canker to rest. I did hope others experienced in cultivation would have joined in the controversy, and by giving the benefit of their observations have aided in taking away the opprobrium of orchardists—that notwithstanding centuries of cultivation nothing definite is known of a disease which is their greatest terror and bane. There may be favoured districts where the disease is unknown, but my experience leads me to believe that most growers of fruit trees have under their care cankered trees which it would be well worth their while to study and treat experimentally. The work would soon interest them, and by patient observation and availing themselves of modern scientific methods and appliances, especially the microscope, in the use of which, considering the mischief wrought by low forms of life invisible to the naked eye, every good cultivator ought to be an expert, they might in course of time satisfactorily and definitely solve the question as to the origin of canker, and when the cause is known it might not be difficult to find a remedy.

I hope some will give a fair trial to the treatment suggested by me, which is based on the assumption that the disease is caused by imperfect nutrition. I recommend in the case of the Apple that they should apply as a top-dressing a complete artificial manure containing full proportions of lime and soda, as the analysis of the ashes of this fruit tree shows it to contain an unusually large proportion of these elements. Wood ashes or stable manure, preferably the former, may be substituted for the artificial manure; but whichever is used proportions of lime and common salt should be added. I can in support of my recommendation appeal to my own experience of this remedy. Four years ago many of my Apple trees were very much affected; in fact, as I have elsewhere stated, about a score having become very unsightly were marked for destruction, but ultimately reserved for the experimental treatment. The whole of my Apple trees in the winter of 1886 were dressed with artificial manure to which soda and lime had been added. These trees from 1887 have been from time to time carefully examined by experts, yet up to the present date not a single trace of the active disease has been found. Under these circumstances it is difficult for me, having used no insecticide, to believe that Mr. Hiam's theory, that "canker is caused by an insect," can be true. "W.," with many of whose views on the subject I agree, has inspected my trees (I shall be happy to show them to anyone interested in the matter who will give me timely notice of his intended visit), and has quoted my case in opposition to Mr. Hiam's. "W." correctly stated that I had used no insecticide, as in fact nothing other than the manure has been applied to my trees. Will Mr. Hiam kindly give fuller information of the treatment of the trees stated by him to have been cured? Did he previously to the application cut away the diseased parts? If so, it would be interesting to know what was the appearance of the wound in succeeding years. Did Mr. Hiam in the course of his treatment root-prune, transplant, top-dress, mulch, or in any other way, excepting the application of the insecticide, deal with the trees? I hope that Mr. Hiam will send to the *Journal of Horticulture* some more specimens of the insect which he charges with the offence in order that it may be identified.

Some eminent German authorities have stated that a form of fungus is the cause of the mischief. This may be the case, but I think it quite possible that the fungus, equally with the insect, is the consequence and not the cause of the disease. It would be well if Mr. Hiam carefully inspected the cracks in the bark other than those caused by canker; it may be he will find the insects so

unjustly slandered by him as innocently housed in these as in the crevices of the cankered wound which he accuses them of generating.—EDMUND TONKS, *Packwood Grange, Knowle, Warwickshire.*

CATTLEYA ELDORADO.

THE varieties of this Orchid are numerous, varying as they do from pure white to the darkest shades of colour, and are invaluable for ornamental purposes as well as for cutting during the months of autumn. To grow the plants well they should be grown at the warmest end of the Cattleya house, where a good supply of moisture can be maintained during the season of growth. They appear also to enjoy more water at their roots than the majority of Cattleyas. Where the plants have been grown warm they will have completed their growth and have commenced to show their flower sheaths. When they reach this stage remove them to the coolest and lightest end of the house, so that their pseudobulbs will become thoroughly ripened. The supply of moisture may be gradually diminished, but on no account should they be allowed to become so dry as to prematurely ripen them. Although this Orchid enjoys liberal supplies of water at its roots during the growing season, it cannot endure large quantities of wet unoccupied soil. Being only of moderate growth it does best when somewhat limited in its root space; in fact, succeeds admirably in a basket suspended from the roof, or on a good sized block with a little sphagnum.

ONCIDIUM JONESIANUM.

Few Orchids are more beautiful suspended from the roof of a house. The lip, which is pure white, is very conspicuous with the richly spotted sepals and petals behind. The freedom with which it flowers and the length of time that the flowers last should commend it in this respect to all, however limited the collection may be. It is only right, however, to point out that few Orchids are more seriously injured than this by flowering early and the flowers remaining on the plants until they fade. Imported plants very often flower profusely, even before they have established themselves. It is a mistake to allow them to do so, or even allow them to retain their flowers long after the first season's growth. Plants that are allowed to flower from the first gradually dwindle and eventually die. Remove the spikes as they appear until the plants have made a good quantity of roots and strong growth. Although only a small rooting plant they should not be secured to smooth small thin pieces of wood. They will be found to do better on larger and thicker blocks of wood that are moderately rough outside, so that they are capable of holding moisture for a greater length of time. A little sphagnum on the block is also useful for this purpose. Like most *Oneidiums* it appears to enjoy a moderate amount of light, and grows and roots better in the *Odontoglossum* than in the *Cattleya* house.

DENDROBIUM FORMOSUM.

This and its variety *giganteum* are well worth growing in quantity, on account of the large flowers they produce and the length of time they last in good condition. The flowers are admirably adapted for bouquet making. They are produced on the top of the young pseudobulbs after they have obtained a fair amount of solidity. Both are evergreen, and do well in baskets or shallow pans suspended from the roof. They require more light during growth than is necessary for *D. Wardianum*. Strong sturdy growths should be produced, and these are certain to flower. This can be accomplished by growing the plants in a warm moist structure where they can enjoy shade from strong sunshine and a good circulation of air. Liberal supplies of water are needed during the season of growth, and the syringe may be used freely. The plants do well in good peat with a little living sphagnum on the surface.—ORCHID GROWER.

LIQUID MANURE FOR FRUIT TREES.—Numerous large fruit trees are well set with fruit this season, but in many instances much of this will either drop or be very small if it hangs on unless the trees are fed at the roots in some way. Those against walls or situated in the open cultivated ground and which are growing healthily may not need this assistance, but any that are stunted in growth and perhaps overrun with red spider, as well as old orchard trees generally, will repay for timely attention. Heavy rains have fallen in most parts of the country,

and these will have well moistened the ground to a good depth, rendering it in excellent condition for the reception of fairly strong liquid manure. It is not at the bole of the tree where the feeding roots are to be found, but at a considerable distance from it, or say as far as the spread of branches. On cultivated ground it will hasten the work if a large basin is formed to hold the liquid manure, or shallow furrows may be drawn for a similar purpose, while holes may be formed thickly under orchard trees with the aid of a crowbar. Nothing surpasses the drainings from a farmyard, this being freely supplied to the roots, but sewage water and diluted drainings from a piggery are also safe fertilisers. In any case, or if a special manure is substituted and washed in, a thorough soaking should be given, and repeated if possible, or it will be so much labour thrown away.—I.

SELECT ALPINE PLANTS.

ACANTHOLIMON VENUSTUM.

FOR some time past this has been a very pleasing plant, producing in abundance its elegant sprays of delicate pink blossoms, such as are sure to give satisfaction to a large proportion of those who delight in the cultivation of alpine plants. It appears to thrive best in a mixture of sandy loam and leaf soil, to which a proportion of one-fifth of decayed manure and a sprinkling of old mortar rubbish has been added, preferring a sunny spot and well drained, and delighting in abundant moisture in the summer months. It is essentially a rockery plant; or, if no rockery exist, a raised position in the border should be assigned to it, or it may be grown quite well in pots. Its near ally, *A. glumaceum*, is of free growth, and may sometimes be seen used as an edging; indeed, it was employed thus many years ago in the Exotic Nurseries, Tooting, where it formed compact cushions, ornamental as well as useful. Both species may be propagated by division, an operation best performed in early spring, giving water rather sparingly to *A. venustum* till it has taken well to the soil. Though rather freely flowered, seeds are, according to my experience, but sparsely produced. They are closely allied to the *Staticee*.

PRIMULA MINIMA.

The Fairy Primrose is an alpine gem of considerable merit and deserving extensive cultivation. It is usually recommended for dry positions, but my experience is rather opposed to this. My plants are growing in a rather rich loamy soil in pots, and are abundantly supplied with moisture, which, judging by their luxuriance, suits them admirably; the situation is somewhat shaded and generally moist. The plant throughout is of diminutive growth, not more than an inch high from the soil, the leaves forming the rosettes deeply notched at the extremities; from these tiny rosettes a simple stem bearing a solitary flower springs, which is of a rose colour, nearly an inch across, and these when well grown will nearly hide the plant—that is the spreading tuft of leaves—from view.

A much superior plant is a variety of the Fairy Primrose, called *Vivid*, the flowers considerably larger, brighter in colour, and generally more effective than the type. I only procured this one during last year, having previously no knowledge of it, and am much pleased to make its acquaintance; and since it has proved so decided an advancement upon the original species I am with every confidence recommend it to all lovers of choice alpine. Though readily increased by division of the stools its multiplication is not to be generally recommended, for a large plant is calculated to produce a very telling effect if in one mass, as it should be, though they make but little show if cut up into small seraps. Some years ago I had plants growing in pots 7 inches across, the plants being perfect masses, quite filling the pots; they flowered profusely annually, and were greatly admired. I gave them a similar treatment to that I now adopt, taking care always to withhold water from them during the greater part of the winter season, and admitting abundance of air to the frames day and night, even in the most frosty weather, to these and other choice *Primulas*, believing that our continuous damp winters are opposed to their welfare, and at the same time they encounter no injury from prolonged frost when comparatively dry overhead and at the roots.

As regards repotting—i.e., merely shifting on into larger pots—this may be done at any time during the early summer months; but for dividing and repotting the plants I have found both the early autumn and early spring alike good, with little or no apparent difference as the result. Personally I prefer the month of March, just when these plants exhibit signs of new life, for then the new roots which are annually formed have a better chance of getting away into the soil. After flowering is the generally accepted time for potting these plants, though it has never had my support, for many plants make a great quantity of new roots prior and up to

their flowering, and which in the case of these *Primulas* are subject to injury, to say nothing of the check they may receive when dividing and potting them in the height of the summer.

SAXIFRAGA ARETIODES PRIMULINA

Is a diminutive gem among the many choice kinds which constitute the crustaceous section of this genus. The tiny rosettes of leaves are not more than a quarter of an inch across, tightly packed together, and forming a perfect cushion. It is still, as it always has been, a comparatively rare plant owing to its slow growth, in this respect resembling the type as well as some other small-growing species, as *cæsia*, *diapsioides*, *squarrosa*, and the like. The only generally adopted mode of propagation is by division, but the operator has to be content with very few at a time. Cuttings, however, root readily in moist sand under bell-glasses, the cuttings in this case being the tiny rosettes separated from the parent with the point of a sharp knife, and, if possible, with a heel. Press these into the sand and keep moist and shaded for two or three weeks, by which time many will have formed roots and may be potted singly in small thumb-pots, in a mixture of very sandy loam and finely broken brick rubbish. Progress is naturally slow in the first year, but in the second compact little plants will be formed, which, if carefully attended to, will flower the following year. All this tribe of small-growing *Saxifragas* grow well in sandy loam, leaf soil, and broken brick or old mortar rubbish, and are well suited for the rockery or for pot culture.—J. H. E.

STRIKING CUTTINGS OF BORONIA

MEGASTIGMA.

It is not generally known that cuttings of this deliciously scented and useful greenhouse plant will with proper care and attention root easily and quickly. Our first attempt to strike the cuttings resulted in failure, owing, I believe, to the fact that the young shoots selected were a little too hard and well ripened before being inserted. A more recent attempt has been quite successful. The cuttings taken on this occasion were about half ripened, and were taken off with a heel and inserted in sandy peat in well drained pots, which were plunged to the rim in sawdust and kept close under a handlight placed in the *Camellia* house. The cuttings were dewed with a syringe every day if the foliage was dry, and if several dull or wet days succeeded each other a thin label was placed under the top of the handlight to dry up condensed moisture. The cuttings were, as a matter of course, shaded from bright sunshine till well rooted, when they were potted firmly in small 60-pots and placed under handlights again till they were sufficiently inured to light and air to be placed in a cold frame, where plenty of air is given. In addition to being much appreciated for its sweet scented flowers, this *Boronia* is extremely useful for arranging in groups during the autumn and winter months. Plants in 5-inch pots with numbers of elegant shoots make useful dot plants to intermix with those of dwarfer growth.—H. DUNKIN.

THE LONDON PARKS.

HYDE PARK.

DURING the spring and summer months horticulturists can always pay a visit to Hyde Park with advantage, as something noteworthy can invariably be found, some hint can be gained by observers, and probably turned to good account, as this park has been long famed for the excellent gardening there displayed. In the spring months the beds are gay with bulbs, and these are no sooner past their best than their places are occupied with the plants that provide the summer attraction, for just at the season when the visitors to the park are most numerous it would never do to have a series of bare beds in the most conspicuous positions. The spaces between the carriage drive and Rotten Row, and at the sides, are usually adorned with *Rhododendrons* in variety in early summer, to be succeeded by *Palms*, *Ferns*, *Musas*, and all the usual sub-tropical plants later on, which impart a cool refreshing appearance to that very fashionable and much-frequented portion of the park. Near the head of the *Serpentine* is a particularly pleasing little sub-tropical dell, which from its sheltered moist position is well adapted for such plants. Extensive beds of a similar character, and others filled with flowering plants, are seen in other parts, but the chief floral display is concentrated between the Marble Arch and Stanhope Gate, on the east side, adjoining Park Lane. These are arranged in single and double series, mostly spacious oblong beds, some with the corners rounded, and some small circles between; all are cut in the turf, which is close, fresh, velvety, and admirably kept.

To what may be termed the Park Lane flower garden a few descriptive notes may be devoted, and first it must be remarked that it is evident from a general inspection that no attempt has been made to produce the dazzling effect of masses of colour such as *Zonal Pelargoniums* afford, and which at one time, not long past, were considered

indispensable in summer flower gardening. For several years it has been evident that a gradual change in popular taste was occurring, and at Hyde Park advantage has been taken of this to introduce more variety in the style; more beds of mixed plants have been employed, and we have frequently had occasion to commend these as affording a welcome break from the monotonous masses of colour afforded by the *Pelargoniums*. This year the exclusion of the latter is still more marked, and with the exception of a few beds at intervals they are almost confined to the long ribbon borders near the shrubberies, where they look well as a relief to the rather sombre leafage of town shrubs. It would be impossible, or at least very inadvisable, to attempt to dispense with *Pelargoniums* in large parks like this. Some colour is indispensable, and though *Tuberous Begonias* are now being usefully employed to furnish rich and bright tints, they cannot altogether supersede the older favourites. It is, however, somewhat strange that though Messrs. Laing and Son have for some years most satisfactorily shown what can be effected with *Begonias* as bedding plants, yet in none of the London parks have they been tried at all extensively, and the experiments with them seem to have been made in a rather half-hearted manner, mostly too with varieties that are not the best fitted for the purpose.

The great feature of the bedding at Hyde Park this year is afforded by the *Fuchsias*, of which some thousands have been employed with pleasing results, and all who admire these plants will welcome any attempt to increase their popularity. Not only have they been planted in mixed beds, but larger, bush-like, and taller conical specimens have also been plunged between the beds and on the turf slopes, where they seem to have well escaped the ill effects recent storms were likely to produce. The varieties, however, are not very numerous, and of those selected the well-known useful variety *Mrs. Marshall* is far the best for the purpose, in habit, number of flowers, and colour; the pure white corolla contrasting with the scarlet calyx renders the flowers more conspicuous than those with purple corollas. The latter in quantity have a rather dull effect, and that perhaps is the chief defect of *Fuchsias* for bedding purposes, particularly where the display has to be viewed from a distance. In other respects much can be said in their favour, and if they are only sparingly used they aid very agreeably in increasing the diversity. Besides the variety named the principal sorts grown at Hyde Park this year are *Tower of London*, with a deep purple corolla and red calyx; *Annetti*, with peculiar rosy mauve flowers, the corolla much expanded and funnel-like, free, but the strange tint is rather against it; *Empress of Germany*, double purple corolla and red calyx; and *Madame Cornilison*, an attractive variety with a red calyx and white corolla.

Some of the most distinct of the beds may be noticed briefly, as conveying an idea of the plants employed and the method adopted. From the Marble Arch to Grosvenor Gate the beds are in a single series on the left hand side of the walk when proceeding in a southerly direction, then for the greater part of the distance from the last-named gate to Stanhope Gate there single beds on the left and a double series on the right, the turf here being somewhat raised, and each opposite pair of beds is planted alike. Starting from the Marble Arch there is a showy ribbon border down to the Green Street Gate, occupied with scarlet *Zonal Pelargoniums*, *Ageratums*, *Calceolarias*, and *Lobelias*, a similar border being continued for some distance beyond the latter gate. In one of the first of the beds *Fuchsia Madame Cornilison*, about 2 feet high, is planted in a groundwork of *Violas*, edged with *Coleus splendens* and *Lobelia pumila magnifica*. Another mixed bed contains *Fuchsia Empress of Germany* on a ground of *Mimulus*, edged with *Centaurea candidissima* and *Lobelia Swanley Blue*. In a third *Iresine Lindenii* and *Pelargonium Rosamond Wright* are planted in alternate diagonal lines, the white-edged foliage and pink flowers of the latter contrasting with the dark *Iresine*, and the bed was edged with the golden bronze-foliaged *Fuchsia Meteor*. *Fuchsias* on a ground of *Amaranthus* edged with *Pelargonium Golden Fleece* and *Lobelia* had a rather dull appearance, the ground colour not being light enough. *Iresine Lindenii*, in lines with *Pelargonium Happy Thought*, and edged *Koniga maritima variegata*, formed a fairly good bed; but a more effective one comprised *Fuchsia Tower of London* on a base of *Stenotaphrum americanum variegatum* (erroneously labelled *Stenophorum*) edged with *Centaurea candidissima* and *Lobelia Swanley Blue*. *Fuchsia Mrs. Marshall* or *Mentha Pulegium gibraltaria*, and dot plants of *Iresine Wallisi*, edged *Coleus refulgens* and *Lobelias*, was not very bright, and the *Fuchsias* where employed in this way seem to need a much lighter groundwork to show them to advantage; some grey or white-leaved plant would be more suitable, or a light-flowering plant.

At the Grosvenor Gate commences the double series of beds, and there also are the majority of *Fuchsias* plunged in the grass, plants 3 and 4 feet high, well furnished with growth, and bearing abundant flowers. *Palms* and other large specimens are placed out in a similar way, with the result that this portion of the park has a most diversified and attractive appearance. Mixed beds of *Mignonette* and *Stocks*, or the latter with *Phlox Drummondii*, diffuse an agreeable fragrance, and this is a point that should never be lost sight of, for a few fragrant plants are most welcome in every flower garden. Noting some of the beds in this portion we have in the double series pairs planted in the following manner:—*Pelargonium Triomphe*, pink, small flower, in good trusses, and free, edged *L. pumila magnifica*; tall plants of *Fuchsia Tower of London*, in a ground of *Viola Mrs. Turner* (lavender), edged *Lobelias*; *Tuberous Begonias* in a bed of *Musk*, edged *Iresine Lindenii* and *Veronica Andersonii variegata*; *Fuchsia Madame Cornilison*, 3 feet high, well flowered in a bed of *Viola Cliveden Purple*, very rich, edged *Veronica Andersonii variegata*; *Pelargonium Henry Jacoby* (edge

Veronica), this Zonal Pelargonium well maintains its character as one of the best of the dark-flowered varieties; Chrysanthemum *Précocité*, the early yellow variety, but not yet in flower, associated with Tagetes, and edged with Lobelia Swanley Blue; Calceolaria Bijou, small dark bronzy red flower, free, but rather dull, edge Lobelia; Fuchsia Tower of London on bed of Viola Beauty of Chipping Norton, edge Fuchsia Cloth of Gold—an effective bed, the margin being good.

Next to these is an oblong carpet bed, with centre crosses of Alternanthera versicolor, edged with Pachyphytum; a scroll of A. magnifica and panels of A. amoena, edged with A. paronychioides aurea, edged with small plants of Sempervivum tabulaforme, the whole being on a ground of Herniaria glabra. This bed was well coloured and the design pleasing, without being too elaborate or formal. There were also a few others to which these remarks equally apply, but it is evident carpet beds are not so much in favour as they were. A large circle of the dark bronze-leaved Canna Adrien Robini had a bold appearance, but four small circles of Alternanthera paronychioides major, in which was planted scarlet Tuberous Begonias edged with Alternanthera nana aurea, were not very pleasing, the two shades of red together rather spoiling each other.

Upon the lefthand side one of the most showy beds contained the dazzling scarlet Pelargonium C. Schwind, which possesses as many good qualities as Henry Jacoby for bedding purposes, edged with the golden-leaved Pel. Robert Fish and Lobelias. A mixed bed of the following plants was also interesting though a trifle crowded:—Verbesina gigantea, with large deeply cut leaves and winged stems; Wigandia caracasana, with its bold broad foliage; Nicotiana affinis, Verbena venosa, and the curious Amicia zygomeris, which is rarely seen in bedding arrangements. Mixed beds like these chiefly of foliage plants with a few flowering plants have a good effect. Beyond these there are two other series of beds, one on each side of the walk, and representing most of the plants that have already been noted, with the exception of Carnation Raby Castle, which occupies a large circle, and has some fine rose-coloured flowers. This probably is the same as that which has been for some years so successfully bedded out in the gardens at Raby Castle under the charge of Mr. Westcott, and where a year or two since were some admirable examples of the variety.

With so large a number of beds to fill and such enormous quantities of plants to raise annually it is surprising that so much diversity can be introduced, but the work is well done and thoroughly creditable to the superintendent (Mr. W. Browne) and his assistants.

MR. ROBERT SYDENHAM'S CARNATIONS AND PICOTEES.

THIS collection is well worthy of notice, for it is not only a very extensive one, but the plants are also noticeable for excellent cultivation. These are grown in Mr. Sydenham's private garden at his residence in the Bristol Road, Birmingham. Three span-roof houses are devoted to Carnations and Picotees, one for the former, another for the laced or edged section of Picotees, and another for Fancy and self Picotees and Carnations. These houses are about 33 feet long, 5 feet high at the sides, 7 feet 6 inches in the centre, with a 6-feet high door at each end; sliding glass lights at the sides, removable at will, with removable lights at the top; glass ends and doors, the glass at the sides and ends to within a foot or so of the ground. There is also ample top ventilation on each side of the apex. The pots rest on blue tiles. The shading of the houses is arranged on Mr. Dodwell's plan, and is both efficacious and easily worked. Each house holds about 175 pots. Mr. Sydenham does not overpot; pots firmly, and uses freely inverted oyster shells on the surface of the soil.

CARNATIONS.

Scarlet Flakes.—Alisemonde (Douglas) and Matador were very fine indeed, and Harry Carswell, John Ball, and Sportsman were good.

Scarlet Bizarres.—Robert Houlgrave, very bright; Arthur Medhurst and J. Crossland were very noticeable and striking.

Rose Flakes.—Rob Roy, very bright and clear white ground colour; Miss E. Wemyss, Thalia, and Sybil were particularly handsome; and Dorothy's Sister, delicate and lovely.

Crimson Bizarres.—Master Fred, extra fine; Duc d'Aumale, clear in the white and fine; J. D. Hextall, Joseph Lakin, and Edward Rowan all good; John Harrison was washy in colour.

Purple Flakes.—James Douglas was excellent, and George Melville is one of the best; Gordon Lewis has a good clear white ground, a pleasing shade of purple; Florence Nightingale and Mayor of Nottingham both good.

Pink and Purple Bizarres.—Mrs. Gorton and Sarah Payne stood out prominently as excellent varieties.

PICOTEES.

Mr. Sydenham is strong in these. *Heavy Red-edged* varieties.—Brunette was pure in the white and well marked; John Smith, Dr. Epps, and J. B. Bryant all admirable. *Light Red-edge*.—Emily, Violet Douglas, Thomas Williams, and Mrs. Bower particularly fine.

Heavy Purple-edge.—Muriel, very fine generally; Juliette, Zerlina, and Mrs. Chancellor. *Light Purple-edged*.—Several very fine blooms of Her Majesty, a refined flower of great merit, and Clara Penson very good; Alice, a handsome flower; Nymph, and Sylvia, pure, with fine petal and bloom.

Heavy Rose-edge.—Edith D'Ombrian, rather thin, but lovely in colour; Daisy, a refined lovely flower, and Lady Holmesdale, a very

beautiful flower, good everywhere; a seedling of Mr. Lakin's, marked in Mr. Sydenham's list 109, is a promising flower with a well formed petal. *Light Rose-edge*.—Orlando is a grand flower, and Amy Lakin good.

Heavy Scarlet-edge.—Constance Heron, a fine flower, but with a tendency to "bar"—i.e., to show colour beyond the edge; Mrs. Rudd and Mrs. Sharp both good; also Juliana. *Light Scarlet-edge*.—Lyddington's Favourite in capital form, some grand flowers. The varieties enumerated are but a portion of the collection.

Like many other growers of the Carnation and Picotee, Mr. Sydenham is fully alive to the claims of our superb Fancies and selfs, of which he already has a fine collection. In Fancies there is to be seen such flowers as Agnes Chambers, Annie Douglas, Germania (grandest of all yellows), Colonial Beauty, Mrs. Reynolds Hole, Almira, Dorothy, Countess of Bective, Dodwell's 197, pale yellow and very fine, all flowers of great beauty and sterling merit, which should be in every garden. A full collection of the Kilmurray seedlings are here, some of novel and lovely tints of colour. Then there are the selfs and Fancy Carnations, many seedlings, and some new flowers. Mr. Sydenham has a very beautiful rose self sport from Thalia, several plants and all true selfs, and a very superb rich deep scarlet and maroon sport from Arthur Medhurst, superb petal and form; then another brighter scarlet and maroon sport from Joseph Crossland. On all the plants from each sport the blooms were true. There is a dark ruby self of great promise, Beauty of Whitby, a salmon scarlet, with fine petals and form; Virgo, a lovely pure white; The Bride, another good white; Florence, buff yellow, all good. Another very fine white is to be found in Emma Lakin, a superb flower of fine form. These glorious selfs and Fancies are coming rapidly to the front, and must no longer be ignored, as they have been by old florists in the past. Such is also the opinion of Mr. Dodwell, who gives them every encouragement and carefully hybridises to obtain sterling new varieties.—AN OLD HAND.

EVENTS OF THE WEEK.—The annual Show at Maidenhead will be held to-day (Thursday), and the Co-operative Show will take place at the Crystal Palace, Sydenham, on Saturday next, August 17th.

— **ROYAL HORTICULTURAL SOCIETY.**—At a General Meeting of the Society held last Tuesday in the Drill Hall, London Scottish R.V., James Street, Victoria Street, S.W., Rev. Wm. Wilks, M.A., Secretary, in the chair, the following candidates were duly elected Fellows of the Society—namely, Hon. Mrs. Barton, Henry Thomas Bird, Jonathan Thomas Carr, William Cuthbertson, Robert Moses Dawson, William Day, Saml. Fellows, William Gaymer, Arthur W. Hutton, William B. Morle, Henry Pain, Rev. Canon Phillpotts, G. W. Riley, and Henry Tate.

— **GARDENERS' ORPHAN FUND.**—The Gardens at Ketton Hall, Stamford, were opened to the public, by the kind permission of Mr. and Mrs. Hopwood, on Monday, August 5th (Bank Holiday), in aid of the Gardeners' Orphan Fund. Sixpence each was charged for admission, and 6d. more for tea, the materials for which were kindly given by Mrs. Hopwood for the benefit of the Fund. The sum of £3 16s. 3d. was taken for admission and tea, 12s. for fruit and flowers sold, 1s. 10d. by collecting boxes—total, £4 10s. 1d. After paying expenses of printing and advertising, which amount to £1 18s., this leaves a balance of £2 12s. 1d. in favour of the Fund. The morning was showery, with thunder also, which prevented numbers of people from attending. We may add that the conditions of Mr. H. J. Veitch's generous offer at the anniversary dinner in London having been fulfilled, two more children have been appointed annuitants of the Fund—namely, Robert James Todd, Chester; and Olive Chapelow, Willingham, Cambridgeshire; the non-successful candidates who received the highest number of votes at the recent election. This method of placing children on the Fund as soon as sufficient money is procured for their support, is very suggestive.

— **THE VEGETABLE CONFERENCE AT CHISWICK.**—At a meeting of the Committee appointed to carry out this project, held on Tuesday last in the Council room of the Royal Horticultural Society, Mr. H. J. Veitch in the chair, the revised schedule was presented and will be forthwith distributed. The only alteration from the schedule issued in January is in classification, the vegetables to be represented being the same as originally announced. Mr. Shirley Hibberd was appointed Deputy-Chairman of the Committee, in view of Mr. Veitch's absence during the next few weeks, and a Sub-Committee was nominated, consisting of Messrs. A. Dean, H. Herbst, J. Hudson, J. Wright, G. Wythes, with the Deputy-Chairman and Secretary, Mr. A. F. Barron,

to make the necessary arrangements for adjudication and other matters; also for the dinner of gardeners, nurserymen, and friends, to be held at the Cannon Street Hotel on the first evening of the Conference, Monday, September 24th. As the price is to be 5s. a large gathering is expected, and it is thought the date may be convenient for several country gardeners and provincial seedsmen making arrangements for visiting London on the occasion. With the cordial co-operation of growers of vegetables a large, diversified, instructive, and enjoyable gathering may be expected. The Conference will then be what its promoters hope—a great success.

— GARDENING APPOINTMENT.—Mr. Wm. Rye, late gardener to R. N. Hooper, Esq., Stanshawes Court, Chipping Sodbury, has been appointed head gardener to Captain Belfield, Malmaison, Frenchay, near Bristol.

— THE SPHINCTER GRIP ARMoured HOSE COMPANY desire us to announce that they have just acquired a patent for a new wire mat, which they claim surpasses all others, being self-cleaning, not requiring shaking or beating, and will not rust.

— A STORM of an unusual character visited the neighbourhood of Toddington, eleven miles north-east of Cheltenham, on Sunday evening. After a downpour of rain there was a heavy fall of large hailstones, covering the ground to over an inch in depth. Many of the hailstones were like solid pieces of ice, the largest measuring $1\frac{1}{2}$ inch in circumference. Many plants are injured. The ground under Chestnuts is covered with fragments of leaves; Lettuces look as if they had been shot; Brussels Sprouts have most of their leaves broken down; and most green vegetables are more or less riddled by the hailstones. Onions were so much bruised as to smell quite strong after the storm. Chrysanthemums have had a good many leaves cut off, as well as some tips cut out. Tomatoes have suffered a good deal; those in the open ground have most of their leaves cut off, the stems very much bruised, and considerable injury is done to the fruit; but the injury to the fruit will be more apparent in a few days' time. A cold night followed the storm, as may be gathered from the fact that some of the hailstones remained till far into the following day.—E. BUTTS.

— ROYAL BOTANIC SOCIETY OF LONDON.—The fiftieth anniversary of this Society was held in the Gardens on Saturday last, Mr. John Birkett in the chair. The reports of the Council and Committee of Auditors for the year were read. From these it appears that though the competition of the present is more severe than at any previous time in its history, the year has been a very successful one. The accounts submitted show a gratifying increase in every branch of revenue over the last and for several previous years. The number of Fellows elected—viz., 109, is above the average, and the receipts from the various exhibitions amount to £4022 6s., making, with subscriptions, &c., a sum total of £7378 13s. 7d., or an excess over last year of above £2000. In the more scientific work of the Society the same improvement is seen. 744 students have received free admissions of from one to three months each, and 42,000 specimens of plants and flowers cut for study and examinations by the various colleges, hospitals, and medical schools in London. The collections of medicinal, economic, and interesting plants have been largely increased, and their usefulness added to by more favourable disposition and greater space being granted them. His Highness the Duke of Teck and Mr. H. L. Antrobus were re-elected President and Treasurer, and the meeting closed with unanimous thanks to the President, Council, Secretary, and executive officers.

— THE WEATHER IN JULY.—July was changeable, with a few very cool nights. Some of the days were warm, but only eight were bright. The wind was westward seventeen days during the month. Total rainfall was 1.60 inch, which fell on sixteen days, and 0.36 of which fell on 23rd. Barometer highest 30.49 at 9 A.M. on 1st and 2nd; lowest, 29.50 at 9 P.M. on 25th. Highest shade temperature, 80° on 30th and 31st; lowest, 40° on 24th; lowest on grass, 38° on 17th. A good deal of thunder during the month. Garden spring running 23 gallons per minute on 31st.—W. H. DIVERS, *Ketton Hall, Stamford.*

— ALOYSIA CITRIODORA.—The young shoots, if taken off before they become hard and woody, inserted in light sandy soil, and kept close under handlights placed in a cold frame, will root quickly provided the soil is never allowed to become dry till the cuttings are rooted. Another important point is to take the cuttings from plants in the houses where they have been well syringed; those from the open air are frequently too hard to strike well, and it is in consequence of such shoots being used that "the Scented Verbena" has the reputation of being a

little difficult to strike. At any time of the year that young shoots can be obtained they may be rooted with success, although they strike more freely during the spring and summer months.—H. D.

— ONE of the best early flowering Jasmines is JASMINUM REVOLUTUM for a wall; its dense green foliage makes a capital setting for the bright yellow flowers freely produced. A close annual pruning in the autumn will suffice to keep a specimen within bounds for many years. On a western aspect under a window about 5 feet high to the sill this Jasmine flourishes well; the new growth and freely produced blossoms rise over the window sill and partly up the glass, which has a pretty effect when viewed from the inside of a room.—T.

— BLACKBIRDS.—I do not know what others have to say on this subject, but my experience is that under the "Wild Birds' Preservation Act" they have become a great nuisance. It is almost impossible to keep fruit of any sort except nuts, and netting everything is impracticable and expensive. Catching and also shooting lessens them for a day or two, but fresh flocks come from the woods and fields and take their places. It is not unusual in the early morning to open one's window and drive a score or more from a Gooseberry bed. Now, what may others have to say, and what is the most economical and best way to deal with them?—J. HAM.

— THAT there is more than one variety of STEPHANOTIS FLORIBUNDA few people will deny. I lately saw a striking instance of this in the nurseries of Messrs. Drover at Fareham, who cultivate this plant extensively. With nothing special in the method of culture, one plant had blooms much larger than those generally seen, the corolla being so much more massive as to present a striking contrast to other blooms. In a business of this sort especially a great advantage must be secured by cultivating the finest types of any kind of flower. In private establishments this rule holds good also.—A.

— GOLDEN ELDER.—This useful plant should be grown on a sunny bank in a mass or in the front of the shrubberies, as when backed up by other foliage of a dark colour the effect is improved. To render the leaves larger and of a deep golden tint pinch out the point of each shoot, when the colour will commence to deepen at once and will remain more golden all the summer than when it is allowed to grow uninterruptedly. By pinching the growths a much more compact growth can be assured than when allowed freedom. The tallest bushes can be regulated to a nicety to give the best effect, as in a sloping position a larger area of golden foliage is seen than when the front row of plants is allowed to grow the tallest. By timely and judicious pinching a better effect is obtained than by allowing the growths to ramble at will.—E. M.

— ATHERSTONE SHOW.—A correspondent writes:—"By this post I send an account of the Atherstone Flower Show. I promised the Committee I would endeavour to get a report in the *Journal of Horticulture*, and should feel much obliged if you would give a short space to it. The Show is one of the best in the Midland counties, and the quality of the cottagers' exhibits was beyond praise. You will see that financially the Exhibition was a great success." [Both this letter and report were misdirected, and only reached this office in time for the insertion of the above few lines. Short original reports of shows are at all times preferred to long extracts from newspapers.]

— VIBURNUM OPULUS STERILIS.—This Guelder Rose is the most showy of the Viburnum family, and is much appreciated in the shrubberies, where it produces its snowball-like heads in great profusion, if it be accorded a favourable position as to light and freedom from other shrubs. To supply flowers for cutting it is also valuable, and for wreaths it is most useful. Much depends upon the method annually practised in the matter of pruning this shrub. If it be closely cut in every year, few flowers may be expected. The best plan is to allow plenty of space for it to grow, treat it liberally by adding a small portion of manure to the roots annually in the autumn, which will assist it in making vigorous growths during the summer, and from these growths the flowers will be produced the following season. All the pruning needed when the plant is either covering too much space or getting too thick of branches is to remove the most weakly, allowing space for the stronger to develop and ripen their growth more thoroughly. If a plant show signs of exhaustion, cut it hard in to the old wood, when it will break into new growth, and in this manner reinvigorate itself.—S.

— TUBEROUS BEGONIAS AT MANCHESTER.—Under the auspices of the Northern branch of the National Carnation and Picotee Society the annual Exhibition was held at the Royal Botanical Gardens, Old

Trafford, on Saturday. The weather was not favourable for visitors, but there was a considerable number present in the afternoon and evening. The exhibitors were numerous, and represented a wide area, and the Show was excellent, especially in the class for Picotees. There was also a display of Gooseberries, for which the Carnation Society offered prizes. Some of the berries were of enormous size, one weighing 24 pennyweights 14 grains. The principal prizewinners were Mr. J. Harvey of Stone, and Mr. J. Threlfall. Not the least attractive part of the Exhibition was a beautiful collection of Begonias from the nurseries of Messrs. Ryder & Son, Sale, to whom the Council of the Botanical Society awarded a gold medal. Great advances have been made in recent years in the cultivation of Tuberous Begonias, and Messrs. Ryder have shown what can be attained by careful and scientific hybridisation. The doubles were exceedingly fine, one of the most remarkable specimens being a large scarlet flower called Brightness of Sale. Another immense crimson variety was Samuel Ryder, forming a pretty contrast to Charming Bride, a pure white flower. Messrs. Ryder hold that it is a mistake to suppose the Begonia is simply a greenhouse plant, and in proof of this they exhibited a large collection taken from the open ground at Sale.

— DR. HOGG PEA.—I was fortunate in procuring seeds of the true Dr. Hogg Pea in the spring. I sowed them along with Carter's Lightning on the same day; they flowered the same day, and were ready to pull on the same day. The difference between them lay in the Dr. being the more robust, heavier cropper, and by far the best flavoured. After the long drought in June we had continued heavy rains, which caused a second growth in the early Peas. On looking at them one day I was surprised to find that all the blooms on the Dr. were double. I have sent you a box of the blooms by this post. No one about here has seen such a thing before. Please let me know if it is a common occurrence.—C. W. [We have seen the so-called Dr. Hogg Pea, differing materially from the true variety as raised by Mr. Laxton. It is a first early Pea, and still one of the best in cultivation. We have seen similar examples of flowers in which most, but not all, the stamens are converted into petals, but such changes are not common, and the few that have come under our notice have occurred late in the season.]

— EFFECT OF CAMPHOR ON SEEDS.—Certain curious and all but forgotten experiences of much interest to agriculture and gardening have lately been revived by a German savant. Very many years ago it was discovered and recorded that water saturated with camphor had a remarkable influence on the germination of seeds. As of many other useful hints, the world took no notice of this intimation; but a Berlin professor, having seen the record of it, appears to have established the fact that a solution of camphor stimulates vegetables as alcohol does animals. He took seeds of various sorts, some being three or four years old, and possessing a slight degree of vitality, and placed them between sheets of blotting paper. Some of these he wetted with pure water, and others with camphorated water. In many cases the seeds did not swell at all under the influence of the simple moisture, but in every case they germinated where they were subjected to the camphor solution. The experiment was extended to different kinds of garden seeds, old and new, and always with the result of showing a singular awakening of dormant vitalism and a wonderful quickening of growth. It also appears from the professor's researches that the young plants thus stimulated continued to increase with a vigour and vivacity much beyond that of those which were not so treated. On the other hand, when pounded camphor was mixed with the soil, it appeared to exercise a rather bad effect upon the seeds. The dose in this latter case was possibly too strong. At all events, this action of camphor is worthy of an examination by seedsmen and gardeners, and even farmers might determine how far Wheat and Barley may be profited by the strange power this drug appears to possess over the latent life of vegetable germs.—(*American Horticultural Art Journal*.)

BERBERIS ANGULOSA.

THE *Botanical Magazine* for the present month gives a coloured figure of the above named Barberry, and the plant is interesting, as apart from its attractive yellow flowers and richly coloured foliage in autumn the deep red good sized fruits are eatable and less acid than those of the common Barberry.

"Berberis angulosa is a rare Himalayan species, and one of the largest flowered and fruited of the thirteen found in that mountain range; it is also one of the most distinct, though referred by Lindley to the race-mose *B. aristata*, which he has by error published as *B. umbellata*, Wall.

(Bot. Reg. 1844, t. 44). It was discovered early in the century by Mr. Blinkworth in Kumaon, and gathered later by Wallich in Nepal, and by myself in the adjacent province of Sikkim, at elevations of 11,000 to 13,000 feet. The only evidence of its occurring elsewhere in the Himalaya is the specimen figured, which was sent in flower to Kew by Thomas Acton, Esq., of Kilmacurragh, Rathdrum, Ireland, in May 1888, and the fruit in October of the same year, with the information that it was raised from seed obtained from Cashmir by his brother, Colonel Ball Acton. In the Kew Herbarium there are specimens raised from seed sent to the Edinburgh Botanical Garden by Mr. Gumbleton in 1885, and others sent to Kew by Mr. Gumbleton himself in 1887.

"In Sikkim *B. angulosa* forms a shrub 4 feet high and more, often accompanying the beautiful little *B. concinna*. It grows at a greater elevation than any other of the larger shrubby species except *B. macrosepala*, and forms a striking object in autumn from the rich golden yellow and red colouring of the foliage.

"An erect bush, 4 feet high and upwards, with stout angled and grooved erect puberulous branches; spines three to five-branched, slender. Leaves deciduous, fascicled, 1 to 1½ inch long, sessile or narrowed into a short petiole, obovate or oblanceolate, quite entire or with a few spinous teeth on the thickened margin; tip rounded, apiculate or aristate, thinly coriaceous, often puberulous beneath, opaque above, rather shining beneath, scarlet and yellow in decay. Peduncles solitary or fascicled, very rarely two-fld., decurved, about two-thirds of an inch long. Flower one-half to two-thirds of an inch in diameter, pale golden yellow. Outer sepals narrowly oblong, inner as long but nearly twice as broad; petals obovate, tip rounded, pale yellow. Berry two-thirds of an inch long, globosely obovoid, scarlet, five to six seeded; style very short or 0, stigma pulvinate."

SAFFRON.

"MEDICUS" asks us if we can tell him "something about Saffron whether it is a native plant or not, and if cultivated to any extent in this country." We do not know to what extent it is grown, but evidently more importance was attached to its culture in past times than now. Mr. J. Clark, in his "Notes on the Name of the Town of Saffron Walden," has the following statements:—

"*Crocus sativus*, Saffron Crocus, or Saffron is an autumnal Crocus, the corolla of which is divided into six equal segments. The petals are of a purple blue colour. It has three linear-oblong golden stigmas, which are the Saffron. It flowers in October, and the leaves continue to grow all the winter.

"In October the flowers were gathered early in the morning, and conveyed home in baskets. Then commenced the process of picking out the stigmas (or chives as they were called). These were then pressed into cakes, and dried on kilns constructed for that purpose.

"Saffron was at that time thought a most valuable medicine for many diseases. The produce appears to have varied from 8 lbs. to 20 lbs. per acre.

"The price of Saffron at different periods may be estimated from the presents made by the Corporation to the Sovereigns who visited Walden.

"The quantity of Saffron varied, but it was usually presented in a silver cup or salver.

"Queen Elizabeth received a cup in 1571, but no mention is made of the quantity.

"1614. James was presented with a cup and 1 lb. of Saffron, which cost £3 3s. 4d., a considerable sum in those days.

"1631. 5½ ozs. of Saffron given to Charles I. are charged at 18s. per ounce.

"1665. 20 ozs. of Saffron for Charles II. are charged £5 15s.

"1689. 14 ozs. for William III. cost £3 11s. 3d.

"1717. The Saffron to put in the salver given to King George, cost £1 6s. 6d.

"The first introduction of the plant into Walden is attributed to Sir Thomas Smith, born here in 1512 (the house he was born in is in the Market Place). He was Secretary of State to Queen Elizabeth and Edward IV. But although our illustrious townsman was an extensive grower of Saffron, he certainly was not the individual who first introduced it, for it is evident from the writings of Fleming, a clergyman who resided in the neighbourhood in 1584, that it was extensively grown here in 1540, when Sir Thomas was but young. That the town was celebrated for its culture in 1549, in the time of Edward VI., may be inferred from the circumstances that on its charter being granted by that monarch, the Corporation bore three Saffron plants in their arms. The town must then at that period have been famous for its cultivation.

"Holinshed, who wrote early in the time of Elizabeth, states that the Saffron grown about Saffron Walden (sometimes called Waldenbury) was first planted there in the time of Edward III., and Lord Braybrooke, in his history of Audley End, states that the town took the name of Saffron in the reign of Edward III.

"It was a tytheable commodity by the Abbot and Vicar of Walden in 1444, which was sixty-eight years before Sir Thomas was born; and at a court held for the manor in 1518 the owners of certain hogs found trespassing in the Saffron beds were prosecuted. These facts sufficiently prove that Sir Thomas was not the introducer, but that it was cultivated long before his time. The popular opinion might have originated in his

successful attempts to revive the culture of the plant at a time when it was much neglected.

"Saffron is still retained in the 'British Flora' as a naturalised plant; but I am of opinion that it does not naturalise, as no traces of it are to be found in this neighbourhood. The only instance in which I ever saw the plant growing wild was when this building was erected, and large quantities of earth removed, a few plants came up at the west end of the building, but the next season they all disappeared."

[The name of Saffron is of Arabic origin, and is thus traced in Lyte's "Herbal," published in 1578:—"In the Arabian speech Zahafaran, from thence it was called in French and high Dutch Saffran; in base Almaine Saffraen, and in English Saffron."]

Saffron was in reputation as a medicine, and was cultivated in Greece when Theophrastus wrote, about three centuries before the Christian era. Writing of "odours," he says that the Saffron (*Crocium*) prepared in Aegina and Cilicia was the best. Pliny says that it could not be grown profitably in Italy; and he also states that the Saffron most esteemed was that of Cilicia, especially that grown on Mount Coryeus; next in estimation was that from Mount Olympus; and, lastly, that from Centuripa in Sicily. Columella, Palladius, Varro, and Vegetius, all give some slight directions for its cultivation, as does Florentinus (*Geoponica*, xi., 26) who was a Greek writer on the cultivation of plants early in the third century.

Some have thought, considering that the Romans introduced Vines and other plants which they valued into Britain, that Saffron might have been one of them; but we think a tolerable test of the source from whence a new plant has been imported is the name by which it continues to be popularly known. The Vine and the Cherry, for instance, were introduced by the Romans, and retain names corrupted from those by which they were called by that nation. Saffron retains a name of Eastern extraction, and this inclines us to believe that there is some truth in the tradition preserved by Hakluyt (ii., 164), that bulbs of the plant were smuggled from the Levant by a palmer, and introduced into this country. Gough, Camden, and others of our oldest historians agree in stating it is "a commodity brought into England in the time of King Edward the Third." A time of crusading and pilgrimages.

Conrad Heresbach, writing in 1570, states that it was then cultivated about Spire and other places in Germany, and three years later our Tusser, whose farming experience was gained chiefly in Essex, writes thus in "August's Husbandry," as if Saffron were then commonly cultivated:—

"Pare Saffron between the two St. Mary's days,
Or set, or go shift it, that knoweth the ways,
What year shall I do it, more profit to yield?
The fourth in the garden, the third in the field.
"In having but forty foot, workmanlike dight,
Take Saffron enough for a lord and a knight.
All winter time after, as practice doth teach.
What plot have ye better for linen to bleach?"

This needs little comment—a plot of 40 feet square produced enough for a nobleman's establishment. The bulbs were taken up and planted in fresh ground every third or fourth year; and during the winter the green leaves of the Saffron (*Crocus sativus*) remaining after the stigmas were harvested, made a clean surface on which to outspread the family linen for bleaching.]

ROYAL HORTICULTURAL SOCIETY.

AUGUST 13TH.

THE Drill Hall, Westminster, was well furnished on this occasion, chiefly with nurserymen's exhibits, which were well worthy of inspection. Messrs. James Veitch & Sons exhibited one of the finest collections of variegated and ornamental trees and shrubs ever seen, represented by sprays in pots, resembling small bushes; also a bright group of Gladioli of the Lemoinei type; and boxes of Java hybrid Rhododendrons. Messrs. Paul & Sons, Cheshunt, had an imposing display of Roses, large and small, and various other interesting plants. Messrs. H. Cannell & Sons had a group of exceedingly floriferous double Begonias, some of the blooms of enormous size. Mr. T. S. Ware had a collection of very fine Dahlias, a striking group of Gaillardias, and a new yellow summer flowering Chrysanthemum, which was honoured with a certificate; and Messrs. J. Cheal & Sons contributed an effective display of Dahlias, including varieties of marked excellence. The above collections, with sundry other exhibits, imparted a gay and diversified appearance to the hall, to which fruiting plants of Tomatoes in pots from Chiswick materially contributed.

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair, Messrs. Shirley Hibberd, R. Dean, W. C. Leach, W. Goldring, H. Herbst, J. Walker, F. Ross, H. Cannell, W. Holmes, B. Wynne, C. Noble, J. Frazer, G. Paul, G. Nicholson, and Dr. M. T. Masters.

In Messrs. Veitch's group, for which a silver Banksian medal was awarded, the very distinct *Nepenthes Curtisi* superba was prominent. The plant had four handsome pitchers, dark brown clearly barred with yellow, and was adjudged a first-class certificate. Similar awards were granted for *Rhododendron* Duchess of Fife, with large, well formed, straw-coloured blooms, and to *Gladiolus nanceianus* President Carnot (Lemoinei), with large deep red and yellow blooms. Awards of merit were granted for *G. Aleace*, primrose, and *Chesnier*, yellow and white.

In Messrs. Cannell's group (silver Banksian medal), *Begonias* Mrs. Sitkie, pink; Mrs. Cayzer, yellow; and A. Blanc, rose, were accorded awards of merit; as was *Negelia* or *Achimenes pyramidalis*, a compact floriferous variety with rosy red flowers; and a vote of thanks was awarded for *Colcus Vesuvius*, with very large red and yellow leaves. Small plants of *Rochea falcata* with bright scarlet heads of flowers were effective, and specimens of the pure white double *Begonia Octavie* were remarkable for their floriferousness.

From Messrs. Cheal's (bronze medal) group the single *Dahlia* James Scobie was selected for an award of merit. It is a large well formed flower flaked with orange and scarlet.

A silver Banksian medal was recommended for Mr. Ware's excellent contribution, and an award of merit for single *Dahlia* C. H. Harvey, and summer *Chrysanthemum* The Shah. This is an improvement on the good old *Felicity*, being dwarfier in habit and deeper in colour, and will be of substantial value for pots, flower beds, and borders. A first class certificate was awarded to Messrs. J. Laing & Sons for *Pteris tremula Smithiana*, a distinct and elegant form of this free and useful decorative Fern. A silver Banksian medal was recommended to Messrs. Paul & Son for their Roses and other flowers. Messrs. Hawkins and Bennett exhibited plants of their double Zonal *Pelargonium* Duke of Fife, with bright scarlet flowers freely produced, for which an award of merit was awarded. A botanical certificate was recommended for *Tritonia scurigeria* exhibited by Mr. O'Brien, and a vote of thanks accorded to Mr. G. Ross for *Physianthus albens*. Messrs. Daniels Brothers exhibited glowing bunches of *Godetias* Duke and Duchess of Fife, and Mr. Beale several plants growing healthy, and some flowering freely in fertilising moss; he also staged other garden requisites.

ORCHID COMMITTEE.—Present: Dr. M. T. Masters in the chair, and J. O'Brien, G. Hill, H. J. Veitch, C. Pilcher, J. Dominy, H. M. Pollett, and H. Ballantine.

Mr. G. Norman, gardener to the Marquis of Salisbury, exhibited a dozen cut racemes of *Saccolabium Blumei*, most of them being 2 feet in length, for which a cultural commendation was worthily adjudged. Mr. H. Ballantine, The Dell, Egham, was granted a first-class certificate for the elegant and beautiful *Cypripedium Orphanum*, the result of a cross between *C. Druryi* and *C. barbatum*. He also exhibited fine cut specimens of *C. Morganæ*. First class certificates were awarded to Sir Trevor Lawrence, Bart., M.P., also to Messrs. Hugh Low & Co., for *Vanda Kimballiana*. The plant is of neat somewhat compact habit of growth, and the flowers, which are an inch or more across, with white sepals and petals and purplish violet lips, appear to be freely produced. A cultural commendation was awarded to *Lælia monophylla* from the Burford Lodge collection, and votes of thanks for *Saccolabium cœleste* and *Cypripedium Stonei superbiens*. H. Tate, Esq., Allington Beeches, Liverpool, was accorded a vote of thanks for the rich and beautiful *Cattleya Warscewiczii Hardyana*, which had been previously certificated.

FRUIT COMMITTEE.—R. D. Blackmore, Esq., in the chair, with Messrs. John Lee, J. Willard, J. Cheal, Harrison Weir, F. Q. Lane, W. Warren, A. H. Pearson, J. T. Saltmarsh, G. Bunyard, H. Balderson, G. Norman, G. Cliffe, J. Hudson, P. Crawley, J. Burnett, J. Wright, and Dr. Hogg.

The Gunton Park scarlet flesh Melon was again sent by Mr. W. Allan, very large handsome fruit, the result of a cross between *Hero* of Lockinge and *Austin's* Incomparable, juicy but lacking in flavour, hence passed. Mr. William Smythe, The Gardens, Basing Park, Aiton, sent a medium-sized oval-shaped distinctly netted green-fleshed Melon. It was deep in the flesh, rich in flavour, and a first class certificate was unanimously awarded to it under the name of Basing Park Green Flesh. Mr. H. Divers sent a medium-size well-netted fruit of *Ketton Gem* Melon, but it was distinctly overripe, and no award was made. Mr. F. Nicholas, The Gardens, Upleatham Hall, sent a closely netted fruit of an oval shaped Melon, very tender and unusually sweet, but somewhat lacking in aroma, and lost a certificate by a considerable majority of votes. Mr. Joseph Brutton, Yeovil, sent *Brutton's Perfection* Melon, that had been certificated at the Crystal Palace, but it was decidedly overripe, and no opinion could be formed of its value.

A seedling Apple was sent by Mr. F. R. W. Rich, but extremely acid, and passed. It was thought it would do for a "roadside" Apple, on the ground that boys would not eat the fruit. Mr. W. Roupell sent from Roupell Lodge, Streatham, excellent samples of Irish Peach, Red Astrachan, Red Juneating, and Devonshire Quarrenden Apples—well-grown highly coloured fruits in excellent condition, and a cultural commendation was unanimously awarded.

Mr. H. Balderson sent a bunch of a new black Grape raised by Mr. Wattam, Shendish Gardens, Hemel Hempstead, raised from *Muscate* of Alexandria and grafted on the *Muscate* Hamburg. The berries had much the appearance of Black Alicante and were similarly soft in texture, but with a decided *Muscate* flavour. As it was grown on an evidently unripened lateral the Committee desired to see it again, as it might possibly be firmer in texture from ripened wood. Mr. James Douglas, Great Gearies, exhibited bunches of a white seedling Grape, somewhat resembling *Buckland Sweetwater* in appearance, but much firmer in the flesh, and although it was considered agreeable and refreshing in quality no award was proposed; all the same it is a good white companion to the Black Hamburg, and will perhaps be heard of again. Messrs. H. Lane & Son sent well grown bunches of the American Strawberry Grape, and a vote of thanks was accorded.

Mr. J. Green sent fruits of the Peach Tomato, distinct in colour and

character, but it was passed; a variety similar, if not identical, is grown under the name of Luscious. Some admirably grown Tomatoes in pots were exhibited from Chiswick similar to the one figured on page 69, for which a cultural commendation was unanimously awarded; and a first-class certificate granted to a new variety named Chiswick Hybrid, the result of a cross between Horsford's Prelude and Perfection, the fruits of medium size, smooth, deep red, of good quality, and borne in large clusters, characteristic of the first-named variety.

SHEDFIELD LODGE, HANTS.

In the ground attached to this, the residence of Mrs. Franklyn, an Exhibition was recently held, the place being specially suited to the purpose. The garden is well sheltered from south-west and easterly winds, there being some grand Elms, Oaks, and other forest trees, also choice Conifers. The flower garden is situated on two sides of the house, the beds being informally arranged and planted. The combinations are so effectively displayed that I was compelled to jot down a few of the more striking, as the record might prove useful in future. One large bed was filled with small plants of Tuberous Begonias intermixed with Abutilon Thompsoni, the ground being carpeted with Sedum glaucum; the bright red flowers of some of the Begonias contrasted favourably with the "sentinel" like Abutilons and the glaucous grey of the undergrowth. Another long narrow bed of Begonias was rendered attractive by associating with them down the centre thinly some plants of Ricinus africanus, and on each side well grown and coloured plants of Zea gracillima, the pendulous habit of this striped Maize rendering it appropriate for the purpose and ornamental. Another bed was filled with seedling Verbenas of mixed colours, with here and there a plant of Ricinus africanus. A mass of Heliotrope Swanley Giant had immense trusses of bloom, interspersed here and there with Ricinus Gibsoni and Nicotiana affinis. A circular bed of small shrubs thinly planted was made the home of Iceland Poppies in a variety of colours which belong to that section. A bed of the double Zonal Pelargonium Guillon Mangilli showed its adaptability for bedding purposes. Festuca glauca made a neat edging to a bed of scarlet Pelargoniums, as did Poa trivialis variegata to a bed of Delphiniums. Single, Cactus, and double Dahlias were flourishing, being well in flower even at this early season. The admirable condition of the garden reflects much credit on Mr. Chequer.—E. M.

CULTURE OF CAMPANULA PYRAMIDALIS.

THIS fine old plant seems for many years to have been under a cloud, so seldom has it been seen in fashionable quarters; but as it has claims which will not be set aside, it is almost certain that it will soon come up again with almost the freshness of a novelty, and gardeners may successively find out that two or three plants tenfold more worthless might with advantage be transferred from the greenhouse to the rubbish heap, to make room for the steeple Bellflower of olden times.

Although it has been treated with coldness by many of those who ought to have known better, it has been all along a favourite window plant with amateur cultivators, and I can say without fear of contradiction, that no other plant grown combines in itself so many of the qualities essential to plants suitable for window decoration. In the first place it is strikingly handsome; it is no minute beauty which we must bend over, and after due examination pronounce pretty, but it levies the tribute of admiration at first sight from all who see it. It is not, in general, thought "the correct thing" to stare in at people's windows; but when they contain one or more of these blue pyramids, 8 or 9 feet high, there is no help for it. It is also easy of cultivation, not subject to the attacks of vermin, and, which is a great desideratum in window plants, it does not obstruct much light. As an example of what can be done with it as such, I have seen two plants grown in the windows of a large public school. They had been in flower for nearly two months, and were likely to continue so for a month longer. One of them was 8½, the other 9 feet in height, and their cultivator, on my remarking that they were only in 8-inch pots, informed me that in general he found every inch in the diameter of the pot counted a foot in the height of the flower spike; thus, if the last shift was into 6, 8, or 10-inch pots, the plants would throw up stems 6, 8, or 10 feet high.

The reason why this Campanula is so seldom grown will most likely be found in the fact that, as things go, it is considered rather slow. In these days, when Vines have to carry crops at eighteen months old, and when the old saying, that "He who plants Pears plants for his heirs," has become absolute nonsense, it seems folly to expect that any considerable number of people could be found who would patiently wait nearly three years for a spike of Blue-bells, however grand; but if we begin at the beginning, and raise our own plants, we must do so.

Campanula pyramidalis is generally propagated either by seed—and seedlings make the best plants—or by division of the old plants after flowering. The seeds should be sown in heat about the middle of March in light, sandy soil, and merely covered with a dusting of fine peat and silver sand. When large enough to be handled, prick out the seedlings singly in small pots, and continue them in heat until the pots are filled with roots; afterwards place the plants in a cold frame or pit, giving small shifts when necessary, the last for the season taking place not later than the beginning of August. For this use a rich but porous compost, and take care to insure perfect drainage. During winter the plants should be kept rather dry, in any place where damp rather than frost can be guarded against, and for that purpose the sill of a large,

light window is all that can be desired. Receiving the same treatment during the second summer, with the addition of frequent waterings with liquid manure, next August should find them in 8 or 10-inch pots, leaving room for one more shift in spring, just before the flower stems begin to rise. After the roots have penetrated this, and all the time the plants are in flower, continue to give rather weak guano or other manure water every second day, and soon the great blue Gothic spires, which more than sufficiently repay all these little attentions, will be worth looking at.

After the flowers are past, cut the stems down, and in the following spring, when growth has begun, divide the old stools into as many plants as there are growing points. Treated the same as seedlings, these will flower in the second season, but I have always found plants from seed the freest growing.

Of course plants are to be bought if we know where to purchase them, and thus much trouble is saved; but when once a beginning is made, and a dozen plants or so are raised every year, they form a succession, and the weary waiting for more than two years, which so harasses the imagination, is lost sight of.

The white variety is scarcely so robust, but when grown along with the blue is equally ornamental. As plants for the mixed or herbaceous border, these Campanulas are very fine, although there they have not the same stately dimensions nor delicate colours which characterise them under glass. A warm sheltered border, backed by a wall or shrubbery, is the situation which suits them best.—A. G.

CHRYSANTHEMUMS—TAKING THE BUDS.

THE essay given by Mr. Tunnington at Sheffield, and published at page 49, substantiates in a great measure the critique on Mr. Molyneux's book which was read by Mr. Garnett at Leeds in December, 1886, and part of which was published in the Journal a short time afterwards. It appears to me that the great difficulty is to get crown buds to appear near a certain date; for instance, late varieties such as Boule d'Or, Eve, Meg Merrilies, &c., must show their buds from the 8th to the 20th of August in order to have the blooms at their best about the same dates in November. As far as my experience goes I have failed to bring about this result by letting the plants grow naturally however early they are propagated, notably Boule d'Or, which is one of the latest I am acquainted with. Cuttings of this variety inserted in November, and grown without topping, generally make their first break about the middle of June, and the crown bud appears about the first week in September, which is much too late for securing blooms at the same time as the general collection.

To remedy this I treat most of my plants of Boule d'Or in the same manner as Mr. Molyneux recommends for Eve and Mabel Ward, only about a week later, and generally secure crown buds at the time required, and notwithstanding the unusually warm weather just past, the buds will not be too early. I have, however, again tried one plant of this variety without topping, which at the present time is upwards of 5 feet high, and has advanced 14 inches since making its first break.

Again, as regards the early varieties, such as Elaine, Mdle. Lacroix, Comte de Germiny, &c., what becomes of them if grown naturally and the early crown buds secured? The blooms will be much too early, but if topped from the beginning to the middle of July they will, if in good condition, make a strong growth and show a secondary crown bud about the middle of September.

Some varieties with me make quite a succession of crown buds—three or four—before they come to a stop; these are notably M. Tarin and Fair Maid of Guernsey, the latter of which must not be taken too early, or the buds will resemble small drumsticks, and the flowers be "hen and chickens."

I am quite sure there are many intelligent growers who thank Mr. Tunnington for his Sheffield paper, also Mr. Garnett for his critique, as I know them both to be men of high standing in the Chrysanthemum world.—A FOUR-YEARS EXPERIMENTER.

NATIONAL CHRYSANTHEMUM SOCIETY.

ANNUAL EXCURSION.

FOR several years past the members of the above Society have adopted the laudable custom of meeting once during the summer months to discuss in a friendly way the prospects of the Chrysanthemum season, and at a time which is free from the bustle and excitement of the exhibition period. Mr. Holmes started the idea in the first place, and his suggestion that such a meeting could be rendered more enjoyable and instructive by arranging a trip to some place of horticultural interest was immediately seized upon as the right one, with the result that he has been annually desired to plan a fresh excursion. This year, after careful discussion and several suggestions had been considered, it was decided that the historic seats of Hatfield and Knebworth should be visited if the necessary permission could be obtained from the Marquis of Salisbury and the Earl of Lytton, their respective owners; and this being

readily accorded in both cases, the circular of invitation and programme were issued to the members of the Society. There was a good response, for at the appointed time (10.15 A.M. at King's Cross, Great Northern Station, on Monday, August 12th) no less than sixty-five assembled, including representatives of widely separated districts. All were glad to welcome again their past President, Mr. Sanderson, who looks as sturdy, vigorous, and energetic as ever. Mr. R. Ballantine was also present, with, of course, the indefatigable Hon. Secretary, who is happily fast regaining his usual health. Then, too, the presence of Mr. Shirley Hibberd added materially to the happiness of the party. Mr. Pearson of Nottingham discoursed extensively and interestingly on varied topics; and the veteran exhibitor, Mr. Donald of Leytonstone, recounted some of his past successes. Amongst others the following were noted:—Messrs. Allis, Old Warden; Barnes, Stoke Newington; Brown, South-end; Burgess, Cambridge; Jay, Winchmore Hill; Neary, Hornsey; G. Stevens, Putney; Witty, Nunhead; Bevan, Finchley; Trinder, Dogmersfield; B. Wynne, and L. Castle.

HATFIELD.

Starting from King's Cross shortly after 10.30 the party reached Hatfield Station very near the announced time 11.17, and were met by Mr. Norman, who at once conducted the party to the park entrance, a few minutes' walk from the station, and throughout the time spent with him he proved an admirable, courteous, and instructive guide. It was

take the place of its antiquated relative. The first point to which the party were conducted was the vineyard, where a succession of terraces and slopes, facing in a southerly direction, lead down to the river bed, which is there quite a respectable stream. The Vines which are supposed to have occupied this site in Hatfield's early days have long ago vanished, and the slopes are now occupied with Yew, kept closely clipped, while the paths and the terraces are really avenues of the same, originally probably intended as hedges for protection, but the plants have assumed the dimensions of tall trees with slender bare stems 30 or 40 feet high, their upper branches circling over and interlacing to form quite dense bowers, giving a peculiar appearance to the walks. In the centre a vista is cut from the upper terrace commanding a view of the river, and beyond that it is continued through a green arch of Horse Chestnut to the old kitchen garden, some distance on the other side.

From the vineyard the visitors journeyed back through the park admiring the old Oaks, Beeches, and Limes, with the thickets of Bracken covering extensive tracts, through which the deer were hastening alarmed by such a formidable host. The lake surrounded by shrubberies was next inspected, and several good views of the stately old mansion were obtained. Then we came to a quaint piece of old gardening, which might well be imitated in modern days—namely, the garden of fragrant flowers. It was a moderate sized enclosure with hedges on the lower sides, Roses and Rose arches on the upper side, four corner beds being occupied with Everlasting Peas, red and white varieties in

FIG. 17.—HATFIELD HOUSE.

soon found, however, that the time at disposal would only admit of a most cursory survey of the attractions of Hatfield, and it was a source of regret to many of those present that the extensive ranges of fruit houses had to be omitted. The train to Knebworth was due at a few minutes after 2 P.M., and this necessitated a hurried walk over a considerable extent of ground, and did not admit of any lingering in historic spots, or a comfortable inspection of the quaint features of this most interesting establishment. Some would have preferred remaining for the day at Hatfield, but Mr. Holmes, no doubt judging the walking capabilities of Chrysanthemum growers and admirers by his own energy, was not satisfied with so short a programme; and perhaps he was right, for all were perfectly satisfied before the day was concluded.

Passing through the handsome gates near the station and across a little bridge commanding a pleasing view of the quaint little town of Hatfield and its red tiled roofs, the avenues of old Limes were soon reached, which constitute one of the features of the park. These remind one at once of the extensive avenues of Limes in Burleigh Park, "by Stamford town," and we are informed that they were planted about the same time, and therefore rank amongst the oldest in the kingdom. Here, too, was seen the remains of an old tree known as Queen Elizabeth's Oak, which is said to have been a large tree at the time she ascended the throne, as she was sitting beneath it when the news of Queen Mary's death reached her. Now nothing but a shell of bark and wood remains, one side being filled with cement, but at the top is growing a young Oak which may possibly at some future time

opposite corners; then there were large central beds of Lavender, Carnation, Violets, Mignonette, &c., all yielding their varied perfumes to the air. It was of such an ideal garden Francis Bacon wrote in his essay "Of Gardens" (1625) in this way:—

"And because the breath of flowers is far sweeter in the air (where it comes and goes like the warbling of music) than in the hand, therefore nothing is more fit for that delight than to know what be the flowers and plants that do best perfume the air. Roses, Damask and red, are fast flowers of their smells; so that you may walk by a whole row of them and find nothing of their sweetness; yea, though it be in a morning's dew. Bays likewise yield no smell as they grow. Rosemary little, nor Sweet Marjoram. That which above all others yields the sweetest smell in the air is the Violet, specially the white double Violet, which comes twice a year, about the middle of April and about Bartholomew-tide. Next to that is the Musk Rose. Then the Strawberry leaves dying, with a most excellent cordial smell. Then the flower of the Vines; it is a little dust, like the dust of a bent, which grows upon the cluster in the first coming forth. Then Sweet Briar. Then Wallflowers, which are very de'ightful to be set under a parlour or lower chamber window. Then Pinks and Gilliflowers, specially the matted Pink and Clove Gilliflower. Then the flowers of the Lime tree. Then the Honeysuckles, though they be somewhat afar off. Of Bean flowers I speak not, because they are field flowers. But those which perfume the air most delightfully, not passed by as the rest, but being trodden upon and crushed, are three—that is, Burnet, Wild Thyme, and

Water Mints. Therefore you are to set whole alleys of them, to have the pleasure when you walk or tread."

Above this garden on the east side of the mansion is the flower garden, gay with Pelargoniums and similar plants of the conventional bedding character, but the standard Heliotropes, 3 or 4 feet high, placed out on one side of the garden were much admired. Light and dark varieties were employed, and they looked extremely well, but their appearance will be still more improved when the kinds are more fully developed. The lofty terrace wall bounding the garden on the west side is thickly clothed with Ivies of many varieties, all fresh and beautiful; but one, determined by Mr. Hibberd to be the Azorean or Fig-leaved Ivy, was notable for its distinct light green shade and its deeply cut leaves. A good space was also covered by the Algerian Ivy, another fine variety. Hurrying onwards we find that the south side of the mansion commands a fine view of an open glade in the park flanked by trees on each side, while on the west side is a curious old garden of quadrangular form containing some antiquated Mulberries and flower beds, surrounded by a covered walk formed of Limes arched overhead to form a cool shady retreat on a hot day. A glance at the conservatory and a sheltered dell of fine Conifers completed our inspection, and in a few minutes we had bade Mr. Norman farewell and were on the way to Knebworth, where something of an important character, to wit, a dinner, awaited a hungry party.

of the kind had been intended. Mr. Hibberd followed by proposing votes of thanks to the Marquis of Salisbury and the Earl of Lytton for the permission so freely accorded to visit their gardens, and Mr. Wynne had a similar proposition thanking Messrs. Norman and Kipling for their assistance. Then, after a hearty recognition of Mr. Holmes' labour in arranging the excursion, the members hastened, under the charge of Mr. Kipling, to view the house, gardens, and park at Knebworth.

KNEBWORTH.

The inspection of the mansion occupied some little time, for it is as interesting internally as it is handsome externally, but the first portion of the party was soon busily engaged amongst the outside attractions as the afternoon was shortening rapidly, and there were some who wished to return to town by the earlier of the two trains named in the programme. After quitting the house one of the first features noted were some beds of Phlox Drummondii, and throughout the garden it was subsequently found that this plant is not only a great favourite at Knebworth, but it also succeeds in quite an exceptional way. The value of Phlox Drummondii as a bedding annual have frequently been advanced, but its admirers could not have a better example of the plant for this purpose than is afforded in the garden under notice. One point in their favour was that most of the beds were in the form of Ivy baskets,

FIG. 18.—KNEBWORTH.

A somewhat long walk from the station brought the visitors to the Lytton Arms, where with all due speed they assembled in a tent and did full justice to the substantial 'are placed before them; then followed a little speech-making, but necessarily brief, as there was still much to be done; but the chief event, and one of a very pleasant character, was the presentation to Mr. Sanderson of an illuminated testimonial, bearing the following inscription: "Presented to Mr. E. Sanderson by the members of the National Chrysanthemum Society, in recognition of his valuable services as the President for many years, and for his unwearied efforts on behalf of the Society since its formation. They desire also to place on record their admiration of his skill as a grower and exhibitor of the incured varieties of the Chrysanthemum, which has placed him in the front rank of successful amateurs. That he may long be spared to aid the Society with his advice and experience, and that his future life may be very happy, are the earnest desire of every member."

Mr. Ballantine in making the presentation and Mr. Holmes in supporting it made a few kindly remarks respecting their appreciation of Mr. Sanderson's services, and the recipient responded appropriately, stating that they could not have accorded him any recognition that would have been more agreeable or acceptable. It was just such a form as he should have suggested had he been consulted in the matter. So carefully, however, had the scheme been concealed that until a few minutes before the dinner he had not the slightest idea that anything

a deep edging being composed of that plant, and the arched wire trellis corresponding to the handle being covered with the same. This deep edging serves not only to support the plants, but also to conceal a good portion of the stems which, when this Phlox is grown strongly, is rather too conspicuous, the consequence often being that they fall about, presenting a weedy, dragged appearance that is far from satisfactory. The flowers were large, the colours rich and varied, and the beds altogether were very charming. The flower garden near the house is also one of the most effective, though simple in design, of any in the Pelargonium style of bedding that we have seen this year, and it proves that when carried out in a tasteful manner and varied as much as possible there is much to recommend it wherever bright colours are required. The great point is to avoid a elashing of brilliant tints, and this has been carefully studied at Knebworth, for while sufficient scarlet Zonals have been employed to give the necessary brightness, white flowered varieties, Verbenas, and other plants are used as foils in intermediate beds. Verbena venosa is well grown and telling, as also is Verbena Blue Bonnet, and several beds of Tuberos Begonias show conclusively what can be done with these plants when good varieties are selected. Ivy-leaved Pelargoniums are also placed out in small beds with satisfactory results, Madame Thibaut being especially noteworthy.

Some distance beyond the flower garden is the wild garden, an extensive tract that abounds in beds of plants allowed to ramble un-

checked, mounds of Blackberries and Honeysuckle, beds of Rosa rugosa, and rustic bridges being the chief features; but this appears to be at present in an unfinished state, though it will ultimately be very picturesque. A delightful Fern dell, and a tree-embowered pond surrounded by marsh and water-loving plants (the Water Soldier, Statice being very conspicuous), were successively visited and admired. The collection of Chrysanthemums which Mr. Kipling grows well for late flowering was scrutinised with interest. The vineries and Peach houses also received some attention, for all alike show the skill of an experienced cultivator. A short time was spent at the lake in the lower portion of the park, and then a small contingent departed homewards, leaving the rest to conclude the day with a tea and a journey to town by a later train.—JOURNALITE.

FLORAL DECORATIONS IN NEW YORK.

THE American gardening papers frequently give elaborate descriptions of the expensive floral decorations undertaken in connection with balls and parties in the United States cities, and the following in a recent number of *The American Florist* is an example of what is accomplished. It is a description of the decorations at a ball given by Mr. Cornelius Vanderbilt of New York in the spring.

"Through my connections in this city I had no difficulty to gain entrance to the mansion and take a stroll through the gorgeous apartments. The floral decorations were finished, the florists had left the premises, and the tables were set for 200. The entry has carved oaken walls and ceiling; opposite the door is a broad, beautiful stairway of about eight or ten steps; to the right and left of this hang the life-size oil paintings of Commodore V. and W. H. V.; a half looped up oriental portiere of a creamy white tint hangs across the head of the stairs, and divides this apartment from the hall beyond; to the right of the foot of the stairs is an open door leading to the entry room for the billiard and card rooms below; two large antique bronze vases form the caps of the balusters and from two black antique lamp posts falls a mild light over the surroundings.

"This entry or stair hall was decorated as follows:—The vases, about 2 feet in diameter, were filled with yellow Tulips and yellow Narcissus arranged in a loose, natural way, in a manner that about a dozen of each variety were in a group or cluster; as foliage, sprigs of English Ivy stuck in a careless, irregular manner, and native Fern leaves were used; the background for this display of 'yellow' was formed by a solid bed of Orchids on the plants, the flowers hanging to the right and left of the balustrade; at both sides of the head of the stairs, touching the paintings above mentioned, stood two handsome specimens of Cocos Palms. Standing at the foot of this stairs and turning a little to the right, you caught a glimpse of the entry room. The walls and ceiling of this are polished ebony, decorated slightly with gold and mother-of-pearl; the mantel, also black and gold, is opposite the door; on this stood two small vases, each containing about one dozen American Beauty Roses—and 'beauties' they were, averaging 4½ inches in diameter; these two were just carelessly stuck in, care being taken to have the stems of different height to make them appear natural. The effect produced by these few flowers with their foliage on the polished black background was simply immense. From the stairway they appeared like two pictures of Roses painted on the wall. Only this and nothing else constituted the floral decoration of this magnificent little room.

"Entering over the stairs into the main hall we saw before us another stairway leading to the upper floors of the house. This stairway has but one baluster, as it runs alongside of the wall, but at a height of about 6 feet it makes a turn to the right, displaying its balustrade. Along the entire length of this railing, as far as it was in view, white Azaleas in pots were placed, forming the upper border; then followed white Lilac mixed with Vinea vines; these were in turn followed by various varieties of Orchids hanging irregularly out of what appeared like a rockwork, and which was formed down to the floor with Virginia Laurel boughs. On top of the baluster set a bunch of 100 Magna Charta Roses, while in the corners formed by the stairway stood large specimens of Cocos and Areca Palms. Immediately to the right there is a large fireplace; the mantelshef of it is about 10 feet from the floor, supported by two large carved oaken figures. In this fireplace were two rustic logs, apparently burning, the flames being imitated with scarlet Tulips, and red hot ashes were figured with scarlet Geraniums; to the right and left of these burning logs, but without covering or hiding any part of the carved figures, stood two fine specimens of Yews in pots, while in the background bunches of single white Primroses with their foliage and Vinea vines reminded one of the rough coating of an old-time fireplace back; bunches of flowers hung up inside the fireplace in imitation of some useful articles our forefathers used to appreciate, I suppose, made the 'fireplace of the old homestead' complete. The mantelshef was covered with Orchids, their flowers hanging over the sides in all directions.

"Close to this fireplace about 8 feet from the floor is a little window. The decoration of this insignificant little space was in keeping with the old homestead and a perfect little gem of floral decoration. So simple and yet so effective! A Dracena indivisa, a white Azalea smaller in size than the Dracena, and one conspicuous Orchid were all the plants used for it. The bulk of the decoration rested in the right hand corner; the pots were hidden by green foliage, part of which, together with the flowers of the Orchid hung in a careless natural manner down the wall.

"In the drawing-room where the dancing was to go on only a few

specimens of Palms were used in safe corners. The musicians were on the same floor, but hidden behind a balustrade 6 feet high made of Laurel boughs, which again was crested with a compact row of Orchids, over this balustrade rose the crowns of three handsome Cocos Palms, and the four spaces thus formed were spanned over by Orchids fastened against heavy wire arches. Last, but not least, I must mention a little fireplace in this same drawing-room close by the gorgeous display of Orchids; this was modestly decorated with dark green foliage, native Fern leaves, &c., and from the midst of all these, as if by accident, peeped a modest plant of Marguerite Daisy. I found it strange that not a sprig of Smilax was used in this decoration, and learned since that many people 'of society' have a dislike for it, and it is therefore banished from many houses.

"The decorations of the dining tables consisted of loose bunches of flowers and Ferns, and among the bunches carried by ladies I noticed some containing white Violets as one half and Lily of the Valley as the other, or Ulrich Brunner Roses for one and Heliotrope for the second half; others had Lily of the Valley for one and Orchids for the other. I am told that such bunches range in price from 10 dollars to 35 dollars each.

"Considering the size of the apartments there were not many plants and flowers used in this decoration, but the manner in which they were displayed brought every one to count, and the effect was impressive. Quality took the place of quantity, and if the New York aristocracy makes the style for America, the American florists are to be congratulated that the old custom once more comes to reign."

TERRA COTTA ROSE.

I HAVE no recollection of making any mention of this Rose, or of ever having heard of it before, and think there must be some mistake. Four small blooms now sent me do not seem to differ practically from Anna Ollivier; rather yellower in ground colour, perhaps, but that is probably the result of fading. There does not seem to me any likelihood of its forming a distinct sport. I have now many blooms on my plants of Anna Ollivier with little or no shading, and others fully coloured with the "terra cotta" tint, which has always been quite distinctive of the variety. Many of the Tea Roses are very changeable in colour, and it requires a very decided variation indeed, as from Souvenir d'un Ami to Souvenir A. Prince, or Catherine Mermet to The Bride, to give any hope of a fixed and distinct sport which can rightly be called a new Rose.—W. R. RAILLEM.

PACKING ROSES FOR PARCEL POST.

HAVING always been congratulated on the freshness of my Rose blooms sent to friends at long distances, perhaps a hint or two may be of some use to amateurs. The following is an extract from friends in Luton, about 100 miles from here. "We duly received your Roses yesterday morning. They were indeed beautiful, and opened out splendidly, looking as fresh as if only just cut. They were very delightful, and gave us much pleasure."

These Roses (as usual) were cut in the early morning with the dew upon them. A milkpan was about three parts filled with grass pressed firmly down all round. The pan was then half filled with cold spring water. The grass being raised from the side of the pan, Roses were inserted all round the edge, those with the longest stems being used, and the shortest were stuck upright in the middle until the pan was filled. They were placed in a cool cellar until evening. A box sufficiently large for about three dozen blooms and buds intermixed being procured, this had about 2 inches of short fresh cut grass placed in the bottom, which affords a soft damp, but not wet bed. On this the blooms were laid and placed with the stems towards the middle of the box from either end until only a few inches of space remained. Here a good thickness of the short grass is placed firmly well above the sides of the box, so that when the lid is shut it requires pressing to close, which holds all firm, so that no shaking and rubbing occurs. Before nailing or tying down, a layer of tender Lettuce leaves gently presses on the blooms. Being despatched in the evening they avoid the drying effects of the sun in transit, hence that freshness and bright colour which is so highly prized.—J. HAM.

[Of flowers sent to us to be named few arrive fresher than those packed in soft newly cut grass.]

NATIONAL ROSESHOWS. SHEFFIELD.

IF a warm and liberal support to the Show and to the prize list is required by the National Rose Society in choosing the place for their provincial Exhibition, those authorities must have been amply satisfied that they accepted the invitation of Sheffield for 1889. Two ten-guinea cups, and large contributions to the local prizes, and other rewards offered by the National Rose Society, formed a tempting programme indeed, and it was a great pity that the earliness of the season

and the showery character of July caused so many gaps to be seen on the tables. The conservatory was well fitted up, and formed an admirable situation in the Botanical Gardens, where it was difficult to imagine one was really in the town of Sheffield. The large attendance of visitors in the afternoon must have been gratified to find Yorkshire well to the fore among nurserymen, though the big county seems to want an amateur able and willing to exhibit in the first flight. It was hardly to be expected that the Jubilee Trophy would be wrested from Messrs. Harkness, and, among amateurs, Rev. J. H. Pemberton and Mr. W. J. Grant seem to have brought back the old days of Messrs. Jowitt and Baker, when there were only two "in it," and the rest of us stood by and wondered. At Sheffield the rivals seemed to have tacitly agreed to a division of the spoils, Mr. Pemberton taking the Jubilee Trophy, and Mr. Grant the handsome cup offered by the Mayor of Sheffield for twenty-four. I do not myself think that any exception can be taken to Mr. Grant's entering and showing in division D, which seems below his calibre. He naturally went for the biggest prize, which one would have expected to find offered for thirty-six in division C. Those who have much the best Roses will surely win much the best prizes; and, if we cannot win ourselves, we can admire the Roses of those who do.

Sheffield is certainly centrally situate, and should be fairly easy of access to all parts; and if I again intrude my personal adventures on the readers of the Journal it is with the hope that I may "point a moral" as well as "adorn my tale." Lincoln was my sleeping-place, where my worthy landlady, hearing that I had fetched my show Roses from the cloak room for fear of the gas, and was seeking a night lodging for them, kindly provided a small basin filled with fresh water, and was somewhat dismayed when she saw my boxes. In the morning an unexpected change at Retford caught me napping. I saw all safe into the van of the fresh train, but omitted to interview the guard! Alas! how soon had I forgotten the lesson of Darlington last year, when my best twenty-four performed part of the journey literally standing on its head. Arrived at Sheffield, I flew to the van. Too late! A porter was there before me, and I caught him in the very act of rolling my two six-boxes over and over, as if they were barrels or cheeses, in order to get them out. I must have been very gentle with him outwardly, for he hung about the horse-van as we were starting in evident expectation of a tip. He cannot have known how little disposed I was to prevent his hanging in any sense. Arrived at the place of exhibition, one box of six, though much injured, was exhibited and gained a prize. The other box contained when I started:—One soup-plate, Her Majesty, over-blown; one cheese-plate, Mrs. J. Laing, ditto; three thimbles, Princess Beatrice, Comtesse Frigneuse, and Ethel Brownlow, too small to be called buttonholes; and one indifferent Rose, The Bride. These productions of Nature I had purposed to exhibit if I could muster sufficient cheek, and the tables were fairly crowded so that they would not be much noticed, as the consummation of my entry in Class 14 for "six new Roses." But there was nobody against me, and a good-sized table with "Class 14" on it held my little box, while it was yet elosed, in a commanding but desolate position in its very centre. One of my earliest mentors in the Rose-showing world held (and holds I believe) the letting good money go begging by failing to show in any class in which you possibly can, to be simply unpardonable. Yet when I opened that little lonely box in that prominent position, and saw nothing whatever but tubes upside down and some of the petals of one Rose visible under a heap of wet dirty moss. I am not sure now whether I ought not to have been grateful to that porter after all for so potently solving the question of whether the box was to be shown at all. Class 14 contained no exhibits, and my little moral is—not only to make friends with every fresh guard at whatever cost, but also, to exhibitors in a small way, to remember that six-boxes are especially liable to be upset (though not often rolled, I hope), and can really travel without much inconvenience with the owner himself.

Messrs. Harkness's trophy stand of thirty-six was really very fine and well ahead, Horace Vernet, The Bride, Sir R. Hill, Dupuy Jamain, Duchesse de Morny, Niphetos, and A. K. Williams being quite first-class. Messrs. Mack, however, showed strongly, having a most lovely Maréchal Niel in a prominent position, "dressed," it is true, but very telling. They had also Susan, Duchesse de Morny, and Dupuy Jamain in very good form. One naturally came to Messrs. Dickson's stand with interest, hoping to see some of their new Roses. It was a great disappointment to find they had brought none, and no consolation to read in the Journal that their novelties were exhibited at Wirral and Manchester, though not at the National Show. It was rather sad to see only two seventy-twos, and the name of Cant entirely absent from a National Show. But Messrs. Harkness's first prize stand seemed to show that the end was nearly at hand even with them; and Mr. G. Paul's blooms, though creditable for the season, were small, and had a tail. Messrs. Jefferies and Merryweather showed well in division B.

In the amateur classes the trophy again naturally attracted the best blooms, Rev. J. H. Pemberton's winning twenty-four being quite in his best style. In form and colour his Victor Hugo, which won the medal as best H.P. in the amateur classes, was a bloom to remember, and he had also Comte Raimbaud (very large and fine), with Horace Vernet, Duke of Edinburgh, and A. K. Williams, quite first-rate. The same gentleman was the only competitor in division C, but there was nothing

to be ashamed of in his thirty-six; he must have made a wonderful record at all the late shows. Mr. Grant had not much difficulty in winning the cup for twenty four, but he seemed to be past his best, and a had bloom of Madame J. Desbois in the centre rather spoilt the appearance of his stand. Mr. Prince was well to the front in nurserymen's Teas, but the weather had been sadly against them, and all had suffered from the wrath of St. Swithen. Rev. F. Burnside was fortunate in obtaining such a handsome prize for his twelve, for they could not be called first-class, though Jean Ducher was fine. They were, however, decidedly better than any other amateur could show, and that is the main thing. In Mr. Grant's third prize box there was a truss of Adam (more often shown as President) exhibited unthinned, and consequently with two or three younger Adams affectionately, but perhaps rather obtrusively, surrounding their parent. Someone as I passed by was endeavouring to point out an allegorical meaning in these descendants of our common ancestor, but I incline to the supposition that the exhibitor had no such intention.

It was noteworthy, in class 21, "twelve single trusses of any yellow Rose," to find Francisca Kruger first and Maréchal Niel second. I seem to remember having read in the Journal two or three years ago some depreciatory remarks on Francisca Kruger as being, though the best of M. Nabonnand's raising, not a Rose of much merit; and I fancy this may have been true, and that the fact is it has very much improved lately, as I believe Roses sometimes do. Sometimes green-eyed or malformed, it is often, when half open, a most lovely flower. In the next class, twelve of any white Rose, Mr. Prince's new sport was beaten by a box of Niphetos, exhibited by Miss Mellish, of surpassing purity and cleanness. I was not surprised to hear that all these blooms had been cut from one plant. Such a spotless stand in such showery weather could only have come from under glass. A wide range was offered in class 25, twelve Roses, six of any H.P. and six of any Tea; and it seemed therefore somewhat surprising that the first and second prize stands exhibited exactly the same varieties—Alfred Colomb and The Bride. The explanation is that each of these is a late and yet a first class Rose, and they certainly seemed to show very well together. On the whole, the N.R.S. and the Botanical Society of Sheffield may be congratulated upon as good a Show as could be expected considering the circumstances of the season.—W. R. RAILLEM.

REVIEW OF BOOK.

A Handbook of Cryptogamic Botany. By ALFRED W. BENNETT, M.A., B.Sc., F.L.S., AND GEORGE MURRAY, F.L.S. London: Longmans, Green & Co., 1889.

To the more advanced botanical student no division of the vegetable kingdom presents so much interest and is so encouraging to original investigation as that devoted to Cryptogamic plants. Flowering plants have been under close observation for such a length of time, and the facts connected with their life history have been so freely and fully recorded in popular text books, that they have been within the reach of all. Differences of opinion have existed amongst the authorities, it is true, respecting the more intricate structural or functional peculiarities, and with regard to the classificatory value of certain organs in particular groups of plants. Generally speaking, however, there has been little of an important character in recent years to add to the knowledge of flowering plants as affecting the principles of their structure and reproduction. Investigations regarding the evolutions of plants, or the gradual transition of variation effected by cross-fertilisation through insect aid, have been the most numerous and the most prolific of interesting results, while the microscopic observation of embryonic development has extended our knowledge on the relationship of plants and the origin of singular forms of structure.

In the case of the Cryptogamic, or so-called flowerless plants, progress of a very different kind has been made within the past twenty or thirty years, chiefly because much less was known respecting them, and because there has been a great concentration of attention upon them. Considerable improvements have been effected in the means of microscopic research, and this has been an enormous assistance, as the reproductive organs in the Cryptogamia are in all cases minute, and in all the lower forms exceedingly so, necessitating the highest powers and the greatest care in observation. No doubt the use of imperfect instruments by the earlier investigators led to the record of so many erroneous statements that have puzzled and misled subsequent observers. There has long been a kind of mystery attached to the lower forms of vegetation included in the Cryptogamia, and the researches of recent botanists have not entirely dispelled this, but they have thrown a much clearer light upon the phenomena connected with the growth and reproduction, and within recent years well authenticated facts bearing on these matters have increased at a rapid rate. Unfortunately they have been widely scattered through special treatises, monographs, or papers published on the Continent and in the proceedings of scientific societies, so that they were practically inaccessible to the ordinary student. The work on Cryptogamic botany by the Rev. M. J. Berkeley, whose death we have so recently had to deplore, was the first reliable attempt to convey a general but scientifically accurate knowledge of these plants, and since its appearance in 1857 it has constituted a standard work on the subject. Necessarily, however, since then the advance has been very great, and something bringing the information up to date and containing all that is available has become requisite.

This task has been undertaken by Messrs. Bennett and Murray, and in the work now before us, the title of which is given above, we have the results of their labours.

We have no hesitation in saying that this is an extremely valuable contribution to the literature of Cryptogamic botany, and it will become a text book for students as well as a useful compendium of existing knowledge for botanists generally. It does not claim to be a popular or indeed an original work, but is a scientific exposition of Cryptogamic structure, and a condensation of information obtained from a great variety of sources. But in it is incorporated much of the original work of the authors, Mr. Bennett having undertaken the Vascular Cryptogams, the Muscineæ, the Algæ, and the Schizophyceæ; Mr. Murray having dealt with the Fungi, Mycetozoa, and Schizomycetes. The authors invite original investigators to send them respectively as the divisions named, though each holds himself responsible for the whole of the volume.

The book comprises 473 closely printed pages and contains 378 excellent illustrations from different sources, but including many that are original. All have been selected with great care, are duly acknowledged, and assist considerably in elucidating the descriptions in the letterpress. One important matter deserves special notice—namely, the attempt to simplify the nomenclature by anglicising the terms employed in designating the respective organs. In the place of Sporangium, Archegonium, Antherium, &c., we now have "sporangium," "archegonium," "antheridium," "cænobe," "sclerote," "epiderm," &c. The use of the term "spore" is also restricted to "any cell produced by ordinary processes of vegetation, and not directly by a union of sexual elements, which becomes detached for the purpose of direct vegetative propagation." The word is, however, compounded with other terms to denote special characters in certain classes, as "chlamydospores" in the Protophyta, sporangiospores in the Myxomycetes, &c. In some of the vascular Cryptogams, as, for instance, in the Selaginellas, two forms of spores are produced, one series having hitherto been termed macrospores by many writers, and the other microspores. Messrs. Bennett and Murray now discard the former term in favour of megaspore, as in all respects preferable, and that is adopted throughout the volume. Antherozoid is also employed instead of spermatozoid for the fertilising agents furnished with vibratile cilia and moving by their aid, pollinoid being applied to motionless antherozoids destitute of cilia. In several other respects alterations and improvements have been effected in the existing systems of nomenclature.

The work is in seven sub-divisions, dealing respectively with vascular Cryptogams, Muscineæ, Characeæ, Algæ, Fungi, Mycetozoa, and Protophyta, the descending order having been adopted in preference to the ascending as more in accordance with the method of arrangement in such works adopted by the best authorities, and on the principle of proceeding from the known to the unknown. Under each sub-division are groups, classes, and orders, but except in the lowest classes the distinguishing characters of genera are not dealt with except as illustrating the peculiarities of the order or class. After each section a list is given of the books consulted, and each of the larger divisions is accompanied by a review of the fossil members of the families, some seventeen pages being apportioned to the fossil vascular Cryptogams.

As an example of the style adopted, and also as conveying the most recent information upon a subject that is still very imperfectly understood amongst practical horticulturists, we give the following extract upon the fertilisation of Ferns, the three illustrations having been kindly lent by Messrs. Longmans to accompany the description:—

"The germinating spore develops into the prothallium by the bursting of the cuticularised exospore, and the rapid growth and division of the contents of the endospore into a plate of cells. Before germination the contents of the spore become invested with a new cellulose membrane. But the tabular prothallium does not always result directly from the contents of the spore. In the Hymenophyllaceæ the spore undergoes division, even before the rupture of the exospore, into three cells, one of which only attains great development, dividing by transverse septa, and branching until it greatly resembles the protoneme of a Moss; the flat prothallia then springing from lateral shoots. In most of the Polypodiaceæ, which include by far the greater number of the genera of Ferns, and in the Schizæaceæ, the contents of the spore develop directly into a short segmented filiform protonemal structure, which expands at the apex into a cordate or reniform plate of tissue, consisting at first of only a single layer of cells. If a single apical cell is present, it soon disappears, and is replaced by a growing point situated in a depression at the anterior end of the prothallium, behind which a cushion, several layers in thickness, is formed by tangential cell divisions. The prothallium is most commonly monœcious, though the sexual organs may not appear at the same time, and is strictly bilateral or dorsiventral, the result, according to Leitgeb (Sitzber. Akad. Wiss. Wien, lxxx., 1880, page 201), of the action of light. The archegones are found exclusively (except in Marattiaceæ) on the under side of the cushion. Rhizoids are produced in large numbers on the under side of another part of the cushion; the antherids also on the under side among the rhizoids, or less often on the margin. In *Gymnogramme leptophylla* (Desv.) the prothallium is many lobed, and the archegones and antherids are produced on separate conical tubercle-like outgrowths from its under side, which penetrate into the soil, where they are perennial, and may give birth by budding to new prothallia, while the sporophyte generation is annual. The prothallium is occasionally, in the Hymenophyllaceæ, reduced to a single row of cells terminating in an antherid, or even to a single cell. Campbell has

detected continuity of protoplasm in the cells of the prothallium of *Struthiopteris germanica* (L.). In the Osmundaceæ the prothallium springs directly from the spore without any intermediate protoneme, a plate of cells being formed on germination by longitudinal and transverse divisions; the first rhizoid is formed out of a posterior cell. The ribbon-shaped prothallium of *Osmunda* (L.) is characterised by the presence of a midrib composed of several layers of cells running along its whole length. The archegones are produced on the under surface on this midrib; the antherids either on the margin or on the under surface with the exception of the midrib. An approach towards a higher type of organisation is indicated by the tendency of the prothallium to become dioecious in the Osmundaceæ, and in *Struthiopteris* (L.). All the spores from the same sporangium sometimes produce male prothallia—i.e., such as bear antherids only, the archegones being produced later, and in smaller numbers, on female prothallia; or the same prothallium may produce first antherids and subsequently archegones, when it may be termed proterandrous. This is remarkably the case also in *Gymnogramme*. In *Cystopteris fragilis* (Bernh.) (Polypodiaceæ) Campbell states that there are two kinds of prothallium, a smaller male

FIG. 19.

Germination of prothallium of Fern, with exospore still attached. *a, b*, *Dicksonia antarctica*, Lab. ($\times 240$); *c, d*, *Aspidium Filix-mas*, Sw. ($\times 150$). (After Luerksen.)

and a larger hermaphrodite. The prothallium of Ferns is sometimes propagated vegetatively by the production of adventitious shoots from single marginal cells, which become detached and form independent prothallia. This takes place especially in Hymenophyllaceæ and in *Osmunda*, but occurs also in Polypodiaceæ, abundantly in *Gymnogramme* (see Cramer, Denkschr. Schweiz. Naturf. Gesell., 1880). The prothallium of *Vittaria* (Sm.) produces peculiar stalked bulbils.

"The antherids of Ferns are small papilliform projections on the under side or margin of the prothallium (very rarely on the upper side), produced amongst the rhizoids, and of similar origin—i.e., from a single superficial cell; in the Hymenophyllaceæ they are produced also on the protonemal filaments. The protuberance becomes separated by a septum from the parent superficial cell, and then sometimes divides at once into the parent-cells of the antherozoids. But more often the papilla divides first of all into a central cell surrounded by a single layer of peripheral cells. These last are barren, but contain chlorophyll; while the central cell divides still further, each derivative nearly cubical cell then producing a flat spirally coiled antherozoid contained within a vesicle, or 'special parent-cell.' In no case is the number of antherozoids produced by a single antherid very considerable. The function of the peripheral cells appears to be to absorb water violently when the antherid is mature, in consequence of which they swell up considerably

and rupture the central cells, thus causing the escape of the parent-cells of the antherozoids. From each of these is then discharged, by the bursting of its delicate cell-wall, an antherozoid consisting of a flat band of protoplasm coiled spirally three or four times, and bearing at its anterior end a number of fine cilia (fig. 20). To its posterior end is

FIG. 20.

Antherid of *Adiantum Capillus-Veneris*, L. in different stages. *p*, prothallium; *a*, antherid; *s*, antherozoids; *b*, vesicle with starch grains ($\times 50$).

frequently attached for a time a vesicle containing starch grains, which is probably the remains of the special parent-cell of the antherozoid. As in other vascular Cryptogams, the body of the antherozoid appears to be formed from the nucleus of the mother-cell, the cilia from the cell-protoplasm.

"The archegones are produced on the under side of the cushion of the prothallium, but in much smaller numbers than the antherids. Like them, each archegone is derived from a single superficial cell, which at first bulges only slightly, and is first divided into three cells by two tangential walls. The lowermost of these three, or basal cell, divides further, and takes its share in the formation of the venter, or swollen part of the archegone, which is altogether imbedded in the prothallium. The outermost of the three cells develops into the neck wall, or outermost wall of the neck of the archegone, dividing at first into four cells, from which the four rows of cells which constitute the neck are formed by oblique septa. Since the neck grows more rapidly on the anterior side—i.e., the side nearest to the apex of the prothallium, and hence become convex on that side, the number of cells is also larger in the anterior rows of the neck, the usual number being six, while there are seldom more than four in the concave posterior side. From the middle one of the primary cells arises the whole of the axial row of cells of the archegone, consisting of the central cell and the canal cells. During

FIG. 21.

Archegone of *Adiantum Capillus-Veneris*, L. in various stages. *A B C E*, in longitudinal section; *D* in transverse section: *h*, neck; *sl*, canal-cells converted into mucilage; *s*, ventral canal-cell; *e*, oosphere; in *E* divided into a two-celled embryo ($\times 800$). (After Goebel.)

the development of the neck this middle cell becomes pointed upwards, and forces itself between the neck cells; this pointed portion becomes divided off by a septum, and now forms the single neck canal cell, which lengthens as the neck lengthens. The large central cell now breaks up into an upper and smaller ventral canal cell and a much larger

lower cell, the protoplasmic contents of which subsequently become rounded off, and constitute the oosphere. According to Campbell, the ventral canal cell is wanting in *Struthiopteris germanica* (L.). The walls of the canal cells swell up and become converted into mucilage, and finally this thin mucilage, together with the protoplasm of the canal cells, is expelled from the open neck. The antherozoids are retained by the mucilage, and collect in large numbers before the archegone; a number of them force themselves into the canal of the neck, and of these some eventually reach the oosphere, and coalesce with it, entering it at a light coloured spot near the neck, which is termed the receptive spot. After impregnation the neck closes up. It is very rare for more than one archegone to be fertilised on the same prothallium, and the enormous majority of prothallia perish without producing any sporophytic generation."

The book is neatly and substantially bound, well printed on good paper, and creditable alike to authors and publisher.

HORTICULTURAL SHOWS. ROMSEY.

THE annual Exhibition of the above Society took place in Broadlands Park on Monday, August 5th, and was in every way a great success. Many readers will remember that Shows were held by the same Society in the years 1880 and 1881, but through wet days and other causes were allowed to die out. The Society has now made another successful start, and it is hoped will go on for many years. The Society is fortunate in having for its President the owner of Broadlands; the Hon. Evelyn Ashley, who places at the disposal of the Committee the beautiful park and pleasure grounds. The Society has also an excellent Secretary in Mr. B. Chignell, who tries his utmost to make the Show a success.

The principal prize in the schedule—that for twelve stove and greenhouse plants, distinct, six to be in bloom—was easily carried off by Mr. Budd, gardener to F. G. Dalgetty, Esq., Lockerby Hall, Romsey, who had a very fine collection of plants, comprising large *Stephanotis floribunda*, *Allamanda Hendersoni*, *A. grandiflora*, *Ixora Williamsi*, *Bougainvillea glabra*, a very fine *Croton Queen Victoria*, *C. paradoxa*, *Gleichenia Mendellii*, *Areca Verschaffeltii*, and a good plant of *Alocasia Lowii*. In the class for six stove and greenhouse plants, distinct, the same exhibitor was again first, having capital plants of *Cycas revoluta*, *Dasylirois corymbosa*, *D. longifolia*, *Croton angustifolius*, and *Cassia corymbosa*. There were five groups put up for the prizes offered, foremost among which was Mr. Budd, who showed a very tastefully arranged group, having for the back plants of *Cocos Weddelliana*, a groundwork of *Maidenhair Fern*, interspersed with well-coloured small *Crotons*, *Tuberose*, *Francoa ramosa*, *Cattleya Eldorado*, *C. crispa*, &c. Mr. Osman, gardener to Mrs. Strong, had a good group for the second prize. Mr. R. West, gardener to J. R. Wigram, Esq., Northlands, Salisbury, was third. Mr. Evans, gardener to Lady Ashburton, Melchet Court, was the most successful with *Colcus*, Mrs. Strong and Mr. R. West taking the remaining prizes. Mr. R. West had the best *Gloxinias* and *Achimenes*, showing well in each class.

Fruit.—There were three collections of six dishes put up, all of which were good, there being a very close run for second and third places. Mr. Budd had very good samples, which won for him the first prize. They were a handsome *Queen Pine*, beautiful colour, good *Muscat of Alexandria* and *Black Hamburgh Grapes*, *Brown Turkey Figs*, *Violet Hâtive Nectarine*, and *Peaches*. Mr. Fowler, gardener to the Hon. Evelyn Ashley, Broadlands, also staged a first class collection, including *Muscat of Alexandria* and *Black Hamburgh Grapes*, fine *Dr. Hogg Peaches*, and good *Moor Park Apricots*. Mr. Evans was third. Mr. Fowler was the most successful with *black Grapes*, having fairly well finished *Black Hamburghs*, Mr. Budd being second; and in the class for two bunches of white *Grapes*, Mr. Budd was first and Mr. Fowler second for *Muscat of Alexandria*. Mr. Fowler had the best dish of *Peaches*, very fine fruits of *Dr. Hogg*, as also he was first for *Nectarines* and first for *Apricots* for a very good dish of *Moor Park*. Mr. Budd showed the best six dishes of hardy fruits, having in his collection *Rivers' Prolific Plum*, *Early Alexander Peaches*, and *Moor Park Apricots*. Mr. West had the best stand of *Roses*, and also the best stand of twelve herbaceous cut flowers, the latter being very good.

Vegetables were well shown, Mr. Evans being the most successful, having very fine *Cauliflowers*. Mr. West showed the best six dishes of *Potatoes*. Mr. Evans had the best brace of *Cucumbers*, and Mr. Fowler the best dish of *Tomatoes*. The Judges were Mr. Cox and Mr. C. Warden.

STREATHAM.

A SHOW was held in the Streatham Town Hall on August 7th and 8th, and though the exhibits were not very numerous for such a good district, the quality was satisfactory in the leading classes. With keener competition the Exhibition might be greatly improved and extended. H. Tate, Esq., Park Hill, Streatham (gardener, Mr. W. Howe), was the most successful, securing first prizes for six foliage plants, six Ferns, six plants in flower, a group of plants, a collection of vegetables, and six dishes of fruit. The chief feature of the Show was formed by the groups in competition. Mr. Howe's premier contribution was very tasteful, bright, and well finished, tall *Palms* at the back, with *Campanula pyramidalis* (blue and white), *Lilium auratum*, and *Celosias* rising from a bed of *Ferns*, well coloured *Crotons*, *Fuchsias*, and

Acalyphas, with a margin of *Clerodendron fragrans*, *Caladium argyrites*, *Adiantum cuneatum*, and *Panicum variegatum*. Mrs. Gabriel, Norfolk House (gardener Mr. E. Cherry), was second, also with a good group, but the background was not quite satisfactory. Campanulas were freely employed with *Fraucoas* on a base of *Adiantums*, *Grevilleas*, *Zinnias*, and *Hydrangeas*. T. Gabriel, Esq., Elmstead (gardener, Mr. Guyatt), was third, his group containing well-grown plants, but the arrangement was a little heavy; *Vallotas* and *Primula obconica* had a good effect. Miss Lambert, Oak Hill (gardener, Mr. Sadler), was fourth, the group being chiefly composed of Campanulas. In the other classes for plants Mr. Howe was followed by Messrs. Fullbrook, Cherry, and Guyatt. Miscellaneous non-competing groups were contributed by Mr. J. W. Silver, Norbury; Messrs. J. Peck & Son, and Mr. Sadler.

HURSTPIERPOINT.

THIS Society held its third annual Exhibition in the Chinese Gardens on Wednesday, the 8th inst. The exhibits, over 500 in all, were arranged in one large tent under the able superintendence of Messrs. Richardson and Bunney, and when completed certainly presented as bright and cheerful a picture as anyone would expect to see. The exhibits as a whole, were without a doubt as much in advance of that of last year as the present season has all along been over that of 1888. This improvement was very noticeable in the miscellaneous groups of plants, which is one of the leading features of this Show, not only in the arrangement, but the plants were better, a result that might be gratifying, and local gentlemen who are fond of having their homes furnished with well grown plants would do well to encourage exhibiting in this class. The premier award was worthily given to Mr. M. Burchell, gardener to S. Hannington, Esq., Strood; Mr. A. Scutt, gardener to G. F. Jenkins, Esq., Burgess Hill, being a very fair second. In the class for six specimen plants, mostly foliage plants, Mr. A. Bish, gardener to Miss Fitzhugh, Street, was a good first. The same gentleman also had the best single specimen plant, a very fine *Adiantum farleyense*, and was first for *Gloxinias* with such plants as are rarely seen at a local show. The *Begonias* were fine and bright, those shown by Mr. G. F. Wickham, gardener to J. Humphrey, Esq., Keymer, being placed first; and Mr. Burchell's *Coleuses* were a remarkable fine colour, and good plants. Amongst cut flowers hardy herbaceous flowers were well represented. In two classes fourteen stands of twelve were staged, and W. Manton, gardener to Mrs. Clifford Borrer, Bolney, was the fortunate winner in both classes. The ladies' baskets of flowers were as attractive as they were last year, two of which were entered. Miss Bird was placed first with one of light graceful arrangement, in which Sweet Sultans and Maidenhair Fern were the chief features. Mrs. Sharwood was second, and Mrs. Ball third. There was also a good show of hand bouquets.

In fruit, Grapes were well represented by neat if not very large bunches. Mr. F. Godby, gardener to Dr. Wither Moore, Burgess Hill, was first in his usual good style, closely followed by Mr. J. Holman, gardener to A. H. Good, Esq., Burgess Hill. Mr. J. White, gardener to Mrs. Bacon, Keymer, showed some fine Peaches in the class for a dish of six, and also in the class for the dishes of fruit, and was first in each case. They were named Noblesse, but colour was so good as to make many who saw them doubt its identity. The same exhibitor was also first in both classes of Apples against numerous entries. Mr. W. Chandler, gardener to Rev. R. Holme, St. George's, was first for twelve Tomatoes, with splendid fruits of Sutton's Perfection. The competition in the vegetable classes was very close indeed. The trays were numerous and good. For the Society's prize, eight dishes, Mr. F. Godby was the winner. Mr. G. F. Wickham won Mrs. Mud's prize, and Mr. W. Manton was awarded Messrs. Sutton's prize. Over a hundred dishes of Potatoes were staged in the various classes, and were of high quality. Some of the sorts that came most to the front were Snowdrop, Schoolmaster, Vicar of Laleham, and Beauty of Hebron.

For the special prize list the local tradesmen came out in their usual liberal style, with shoulders and legs of mutton, garden tools, &c., for cottagers, not the least appropriate of which, perhaps, was "ducks for Green Peas." Messrs. Balchin & Son, of Hassocks and Brighton, made the only trade exhibit—a collection of well-grown decorative plants, &c., and G. B. Woodroof, Esq., Oaklands Park, had a large group of plants, not for competition, at the far end of the tent. The weather was all that could be desired, and a most enjoyable day was spent. Perhaps the hardest work fell on the shoulders of their worthy Secretary, Mr. T. G. Neil.

LEICESTER.

A CORRESPONDENT sends us a long newspaper cutting of this Show, from which we take the following extract:—

The exhibits were staged in five spacious marquees, the first being devoted to groups and stove and greenhouse plants, &c. There were only two groups entered for competition, and the Judges had no hesitation in awarding the first prize to Mr. S. A. Murray, gardener to Mr. S. Bennett of Knighton. The beauty of his collection was greatly enhanced by the facility and taste displayed in the arrangement, the colours being charmingly distributed, and there being a general air of lightness in the arrangement which had a really beautiful effect. From a base of greenery the flowers sprang up in the most natural way, and four large and handsome Palms towered over them in the centre, which gave a capital finish to the group, which comprised a number of rare tropical and greenhouse plants. Of the other group less can be said, the Judge's decision being generally endorsed. The individual specimen plants in this tent were not particularly striking, but the exotic Ferns were a splendid collection, and there was also an admirable display

of Fuchsias. In the marquee devoted to cut flowers the Roses and bouquets were prominent features amid collections which were throughout excellent. The principal exhibitors here were Messrs. Perkins (Coventry), Burch (Peterborough), Mack & Son (Catterick), Merryweather (Southwell), Harkness & Son (Bedale, Yorks), and Pemberton (Havering). Considering the lateness of the season the show of Roses was truly magnificent, and in several of the classes competition was exceedingly close. The Tea Roses, and the new Sir Rowland Hill particularly, pleased the connoisseurs, both for cleanness of growth and delicacy of colour. Messrs. Harkness & Son, Merryweather, and Mack and Son carried all before them in this department, while Messrs. Perkins' bouquets and wreaths, Mr. Taylor's table decorations, and Mr. J. Smith's sprays were triumphs of skilful arrangement. The herbaceous plants exhibited in this tent were also wonderfully good, the Zonal *Pelargoniums* attracting perhaps most attention. The Picotees and Carnations were also an admirable feature. In class 20, for twelve bunches, one competitor was disqualified, owing to sending too many varieties. Mr. Blair, gardener to the Duke of Sutherland, came first in this class, and Mr. Hickling of Loughborough was awarded second, but there was no doubt as to the relative merits of the different collections. Messrs. Thomson & Co., and Mr. Brown of Birmingham, were also very successful exhibitors of Picotees, which seemed to have been brought to the height of perfection. Considering that the season for Asters is yet early, the show of this bloom was also very commendable, and the cut flowers throughout were excellent. Mr. B. S. Williams of Holloway, London, sent a choice collection of plants, not for competition, and noticeable in the same marquee was a splendid display of valuable ware, comprising handsome designs in stands for table decoration, by Mr. J. Staynes of the Market Place and Gallowtree Gate.

The show of fruit was declared to be better than at any previous Show. As in other open departments the entries in some classes were not numerous, but any lack of quantity was amply made up by the extraordinary good quality. The gardeners to the Duke of Sutherland and the Duke of St. Albans were most successful in the open classes. The first prize for six distinct dishes was awarded to Mr. Edmonds, gardener to the Duke of St. Albans. His collection included some magnificent Black Madresfield Court Grapes, an English-raised fruit particularly well grown, which with White Muscats, Peaches, &c., were deservedly placed first. The Duke of Sutherland's gardener (Mr. Blair) came second. His collection included some very fine Hamburg Grapes and White Muscats, and the Nectarines here were also very noticeable. Of the other Grapes shown the best came from the same vineries, and were remarkable for their colour. English fruit was well represented by Gooseberries and Currants, the season having been favourable for ripening, as evidenced by the deep colour of most of the specimens. The Melons were also much admired, particularly those shown by Mr. Blair, for which first prize was awarded, and in this tent the splendid show of Tomatoes was favourably commented on. The plants shown by amateurs not employing a regular gardener also deserved a word of recognition, many of them being admirably grown.

In the next tent Dahlias, exhibited by Mr. Wright of Leicester, and Mr. Hickling of Loughborough, and a remarkably fine show of *Begonias* by Mr. B. R. Davis of Yeovil, immediately attracted attention; and the show of cut flowers in this department was throughout very creditable. In division F, open to amateurs, the Roses, though comparatively few in number, were of excellent quality, considering the somewhat advanced season. Picotees and hardy herbaceous plants were well represented. Four splendid baskets of cut flowers and six hand bouquets were exhibited, of the latter bridal bouquets being greatly admired. In division D, open to cottagers, window plants were hardly so well represented as might have been expected, but the specimens on view were certainly the best of their kind. Collections of flowers, vegetables, and fruits, not for competition, were contributed by Messrs. Hickling, Loughborough; H. Vann, Wigston; Mawbey, Humberstone (who were awarded an extra prize); J. Wright, Leicester; Pearson and Son, Nottingham; B. R. Davis, Yeovil; C. F. Clarke, Narborough; and Smout of Hastings, the latter of whom had on view a magnificent collection of seaweed and ocean flowers, arranged for the purpose of table decoration. In division H, for fruits, the eight classes—Strawberries, Raspberries, Currants, and Gooseberries—were well contested, and the quality of the produce was of uniform excellence, but not worthy of special note.

There was an admirable display of vegetables. In the open classes the collections were excellent, notably the one from Shropshire (Mr. J. Lambert's), which took the first prize, every specimen in this collection being in the "pink of condition." The Potatoes, Peas, Onions, and Cucumbers were likewise large in size and of excellent quality, so much so that in many instances the Judges experienced considerable difficulty in awarding the prizes. There was also a strong competition for the special prizes offered for vegetables by various local nurserymen and seed merchants.

TRADE CATALOGUES RECEIVED.

James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea.—*Illustrated Catalogue of Hyacinths and other Bulbous Roots.*

Messrs. Armitage Bros., High Street, Nottingham.—*Catalogue of Bulbs, Roots, and Plants.*

Messrs. Dicksons & Co., 1, Waterloo Place, Edinburgh.—*Catalogue of Flower Roots.*

Harrison & Sons, Market Place, Leicester.—*Catalogue of Flowering Bulbs.*

HARDY FRUIT GARDEN.

EARLIEST PEARS.—Doyenné d'Été, or Summer Doyenné, being thinly cropped, is rather larger than usual. In favoured districts some of the fruit was fit to gather during the last week in July, and the trees would be cleared in about a week. This, when gathered and eaten directly it will part freely from the tree, is juicy and sweet, but if kept for a short time it becomes dry and mealy. Citron des Carmes, another small variety of unattractive appearance, has this season produced numerous large clusters of fruit, and unless these were well thinned out the quality will be very poor indeed. It is about ten days later than the Summer Doyenné, and ought also to be used when first gathered. Beurré Giffard is rather larger than the foregoing, and also superior in point of quality. This should be fit to be gathered and eaten by the middle of August, by which time the delicious Jargonelle will also be available in southern districts. The latter is carrying extra good crops, and in order to prolong the season (the variety will not keep a week after it is ripe) it is advisable to at once gather a few of the most forward fruit, wrapping these in tissue paper, and, after they are packed in a box of soft hay, placing this in gentle heat. It is in this manner the Jargonelle is often ripened for the shows early in August, and in any case a gain of a week or more will be effected. Birds soon discover when the Jargonelle is becoming soft and palatable, and unless netted over in anticipation of their attack a considerable number of the best fruits may be disfigured in a few hours.

THE EARLIEST DESSERT APPLES.—Early Red Margaret was fit for use during the third week in July, and fairly plentiful. Eaten soon after it is gathered, the quality is decidedly good. Early Harvest, which follows closely, has not proved a success this season, but it is a delicious little fruit eaten when first ripe. Mr. Gladstone is quite a failure, but, as a rule, it is a showy early variety, of small size, and good in quality. Beauty of Bath surpasses all the preceding as far as size is concerned, and is a handsome variety, of excellent quality if eaten soon after the fruit parts readily from the tree. It is a sure bearer, and ripens during the first or second week in August. Irish Peach, an old favourite, and somewhat later than the preceding, is very lightly cropped this season, and ripe fruit keep for a few days without being spoilt. Devonshire Quarrenden, another handsome well-known variety, is very scarce this summer. It is usually crisp, juicy, and sweet towards the end of August, and must not be kept long. Either of the three last named may be forwarded much as advised in the case of Jargonelle Pears, but it must be remembered the quality and appearance of the fruit is not improved by this artificial method of ripening.

EARLY KITCHEN APPLES.—The culinary varieties, unlike those fit for dessert only, will keep fairly well after they are ripe, and where the crops generally are thin; this unfortunately being the rule, it is advisable to use the Apples in great moderation while Gooseberries, Red Currants, Plums, and other more perishable fruit last. One of the first to be fit for cooking will be found in Carlisle Codlin, and this happens to be well cropped this season. The seedlings of this as well as Keswick Codlin and Lord Suffield cook beautifully when not more than three parts grown, and their removal will improve the size of those left on the trees. Duchess of Oldenburgh does not keep so well as the Codlins, and may well be used early, and where Stirling Castle, Hawthornden, and Red Hawthornden are well cropped, these also may be gathered from for early use, the first named being the best keeper of the three.

GRAPES.—These are quite a failure this season, but that is no excuse for neglecting the Vines. Last season the wood ripened badly, but this summer the growth is firmer in character, and if duly thinned out and stopped there is every prospect of its ripening satisfactorily. The budding and stopping ought really to have been attended to while yet it could have been done without the aid of a knife, but if this was neglected all superfluous growth should at once be cut out, and the best placed lateral growth reserved and shortened back to the fourth or fifth joint. Any with a bunch attached ought to be stopped at the second joint beyond this, and in all cases the sub-laterals or the side shoots pushed out from the stopped or pruned laterals should be pinched back to a single leaf or joint. Young rods are usually the most productive, especially if they have been laid in early, and stopped when from 4 feet to 6 feet in length.

FIGS.—Very vigorous trees have failed to fruit this season, but those rooting in hard poor ground, as well as any that have attained a great size without being of gross habit, are well furnished with fruit. Firm, short-jointed wood, in addition to being the most hardy, is also the most productive, and this cannot be found on much-crowded trees. In some instances the only way to secure abundance of fruit is to allow a moderate number of shoots to grow out from the walls, only the main branches being strongly secured. In any case the summer growth must be freely thinned out, light and air being absolutely essential for the proper ripening this, the fruit-bearing wood of next season. Summer stopping is sometimes resorted to, but this is a doubtful proceeding, the fruit, as a rule, being most plentifully produced near the points of well-ripened

unstopped shoots. Trees long established and heavily cropped are much benefited by a summer mulching of manure, and an occasional soaking of water or liquid manure in hot dry weather, the finest and most luscious being obtained from old trees thus liberally treated.

KEEPING RED CURRANTS.—Very heavy crops of fine fruit are now hanging on the bushes duly protected from birds, and those in structures permanently covered by wire netting are wonderfully productive. Should the weather keep dry the fruit will keep well, but in a showery muggy August it is liable to rot off wholesale. The only preventive measures are—first, the shortening to the fourth or fifth joint of all lateral growth not needed for enlarging the tree, and thinning the clusters of fruit according as it is required for use. This will admit much more air to the fruit and cause it to keep better.

WASPS AND FRUIT.—A considerable number of wasps are already at work among ripe fruit, and unless checked will soon do incalculable damage. As many nests as possible should be taken or destroyed; one of the most simple plans being to pour a little gas tar into the holes. Davis's wasp killer, used as advised by the maker, is singularly effective when placed where there is ripe fruit. It poisons many wasps and keeps away the rest. Bottles partially filled with beer, sugar, and water, and suspended among the fruit, attract large quantities of wasps and flies, few of which leave the bottles alive.

FRUIT FORCING.

FIGS.—Early Forced Trees in Pots.—Directly the second crop is gathered examine the trees, as keeping them somewhat drier at the roots with a drier condition of the atmosphere, consequent on a free circulation of air, tends to an increase of red spider and scale. These pests are almost inseparable from Fig culture in heated structures, so that the cultivator requires to be ever on the alert; still the enemies steal a march upon the grower, especially during the ripening of the fruit, therefore when that is cleared off the trees recourse must be had to cleansing, and as the foliage and wood is far advanced in ripening destructive agents may be employed at a strength which would not be safe at an earlier stage. If therefore those pests, and especially scale, have made undesirable progress it will be advisable to syringe the trees with a petroleum solution—a wineglassful to four gallons of water, in which 8 ozs. of soft soap and 1 oz. of soda has been dissolved, one person stirring the mixture briskly with a broom handle, whilst another applies it with a syringe to the trees, so as to thoroughly wet every part of the trees, the under as well as the upper part of the foliage, and all the wood. To prevent the mixture soaking into the soil a little dry moss may be tied around the stem, and then a sort of pyramid of the same placed around the stem. If the wood is badly infested employ a somewhat stiff brush for freeing it of the scale whilst wet. In bad cases repeat this in the course of a day or two, afterwards syringing thoroughly with tepid water. The trees will need very little further attention, only giving water to prevent the foliage becoming limp, ventilating to the fullest extent day and night; but protect the trees from heavy rains, which have a tendency to keep the trees active instead of inducing that rest so desirable for those subjected to early forcing. The old practice of placing early forced trees in pots outdoors is now little practised, the trees being continued under glass, complete rest being sought in dryness. If placed outdoors it must be in a sunny position, and the pots stood on a layer of ashes with similar material about them, and though they must not be allowed to suffer for want of water, material must be at hand to throw off heavy rains, in order to prevent the soil becoming sodden. Whether kept under glass or placed outdoors they cannot have too much light or air.

Early-forced Planted-out Trees.—The second crop is ripening, and will need a circulation of air constantly, more, of course, by day than at night. If dull weather prevail a gentle heat in the pipes makes all the difference between well-ripened and insipid fruit. Watering at the roots must be diminished and syringing discontinued, but a moderate air moisture may be allowed for the benefit of the foliage. If red spider is present and there is heat in the pipes coat them thinly with sulphur, or a good syringing may be given after the fruit has been closely gathered, choosing a time when there is a prospect of the moisture not remaining long upon the trees. As soon as the fruit is all gathered the trees may have a good washing with the syringe or engine to free the foliage of dust and red spider, otherwise a free circulation of air, dry and warm, should be maintained in the house until the foliage begins to fall naturally, and which must not be accelerated by allowing the soil to become dust-dry at the roots of the trees.

Unheated Houses.—To insure a crop of Figs with certainty and of the highest quality glass cases or structures with a south aspect are indispensable. The trees succeed capitally if the roots are restricted to narrow borders (one-third the width or height of the trellis is ample), well drained, and not more than 2 feet deep, composed of good loam of a calcareous nature, or adding a sixth of old mortar rubbish which contains what Figs require in lime and sand, or a fifth of chalk may be added and a sixth of road scrapings. If the loam be light add a fourth of clay chopped small and intermixed, which require to be placed together rather firmly to induce a sturdy short-jointed habit. With unobstructed light and provision for free ventilation Figs of the choicest description may be obtained if the usual attention is given in watering through a mulch of partially decayed rather lumpy manure, and feeding with liquid manure as required. It is also necessary that the growths be thin, acting upon the extension system, but securing by judicious stopping a fair amount of spurs. In no case allow more growth to be

made than can have full exposure to light. The fruit is now well advanced in swelling, ours are changing for ripening; therefore spare no pains to keep the foliage clean by syringing in the morning and early afternoon. Do not syringe, however, if the day is likely to be dull, or in the afternoon if there is no prospect of the foliage becoming dry before night. Under such circumstances damp the border, especially in the afternoon, with liquid manure. Admit a little air early, increasing it with the sun heat, maintaining it through the day at 80° to 85° with free ventilation, closing early so as to run the temperature up to 90° or 95°, and when the sun's power is declining a little air may be admitted at the top of the house so as to allow the pent-up moisture to escape, the temperature gradually cooling down. Water or liquid manure will be required once or twice a week, according to circumstances, in order to keep the soil thoroughly moist. When the fruit begins to ripen lessen the supply of water and discontinue syringing, securing a circulation of air constantly, and freely ventilate when favourable; but sun heat should be husbanded, and will do no harm if the atmosphere is not confined, a little ventilation being given so as to allow of the moisture escaping instead of condensing on the fruit and causing it to crack.

PEACHES AND NECTARINES.—Early Houses.—The foliage of trees started in December and early January is now beginning to fall, the trees all the same must not lack moisture, affording water or liquid manure to weakly trees as necessary to maintain the soil in a moist but not a saturated condition, as if too much water is given when the trees are going to rest, and the weather continues hot, the excessive moisture at the roots is apt to cause premature growth, which must be guarded against. It does not much matter about rain, as in that case the trees will be exposed, and the air is correspondingly cool; indeed, rain has a most beneficial and invigorating tendency. As a safeguard against starting the bloom buds, allow such laterals as are green and unripe to remain as an outlet for any excess of sap, they being equally effective in maintaining activity at the roots. Early forced trees do not as a rule make strong growth, having generally a larger proportion of single fruit buds than trees grown under more favourable conditions, triple buds not being so frequent; hence in pruning it is not desirable to cut back next year's bearing wood unless they are of great length, and not then unless necessary to originate growths for the furnishing of the trees, or to secure an evenly balanced head. Very little pruning will be needed provided disbudding has been attended to, no more wood being trained in than is required to replace the bearing wood of the current year, and to renew worn-out growths, as well as to provide for the proper extension of the trees. Trees that have long been subjected to early forcing are seldom vigorous, but not infrequently become so enfeebled as to need the removal of the weak growths, which, though plentifully furnished with fruit buds, are undesirable from their affording much smaller fruits than are yielded by the moderately vigorous and well-ripened growths. Some trees, however, from their indifferent crops make too vigorous or long-jointed wood, pushing laterals difficult to restrain, if they do not frustrate the formation of fruit buds, and interfere with an equal distribution of the sap. Any trees which grow too luxuriantly must be lifted, whilst those which are showing symptoms of weakness may have the old soil carefully removed from amongst the roots, applying fresh turfy loam with about a twentieth part of crushed bones and wood ashes mixed. Give a good watering both to the lifted trees and to those that have had the soil renewed about the roots. These operations require to be performed as soon as the leaves are mature, and before they fall from the trees.

Succession Houses.—Do not neglect to cut away the shoots that have borne fruit unless required for extension, and all the shoots where the growths are too crowded should be thinned. This will allow the foliage to be more readily cleansed by the syringing, repeating as necessary, it being important that the foliage be kept clean and healthy as long as possible. With the freer access of light and air the buds will form perfectly, attention being given to a due supply of water to the roots. Where the fruit is ripening a free circulation of air will enhance the quality considerably, sufficient water only being given at the roots to prevent the foliage becoming limp, and secure air moisture by an occasional damping for the benefit of the foliage, also fruit, which in an arid atmosphere is liable to become mealy, whilst it ripens prematurely if the trees suffer for a proper supply of moisture in the soil. Ants in some cases are apt to be troublesome, eating into the choicest and best fruits. Perhaps the best remedy is to procure a mixture of honey with arsenic duly prepared by a chemist, but we have a strong aversion to its use in fruit houses after the fruit commences ripening, therefore sink some saucers in the ground level with their edges, and as near the stems of the trees as practicable, pouring syrup or treacle into each saucer. The active creatures leave the fruit for the sweetness. Our greatest trouble this year are slugs, they are a perfect nuisance, attacking Nectarines in great force, and are not readily detected amongst the foliage with a lantern, which, however is the only means of riddance, and to prevent their excursions have wrapped some cotton wadding around the stems of the trees. The slugs do not like the downy skin of the Peach nearly as well as the smooth one of the Nectarine.

Late Houses.—Attend to thinning and regulating the summer growths, and if they are laid in thinner than is customary with trees in earlier houses the wood will have a better chance to ripen. Gross growths appropriate an undue amount of sap, preventing an equal distribution, and favour nothing but unfruitfulness and gumming. They must be stopped or removed. Endeavour to secure an even balance of moderately strong short-jointed wood, and to ensure its ripening ventilate freely in the early part of the day, allowing a good heat from sun

through the day, closing in good time so as to run up to 85° or more, for sun heat after evaporation has been going on some time will not do any harm if only care is taken to admit a little air before nightfall to allow the pent up heat and concomitant moisture to escape, and the gradual cooling down of the temperature, thereby securing rest. The night and early ventilation tends to the solidification of the wood and its ripening. Keep the trees free from red spider by forcible syringings until the fruits give indications of ripening. The borders must be well supplied with water or liquid manure, and be mulched with short manure.

VINES.—Early Houses.—The Vines have the wood ripe, and the foliage or some of it is falling, but there must not be any attempt at removing it, nor to cut the laterals closely in, as that would probably cause the principal buds to start; therefore remove the laterals by degrees and shorten some of the long shoots, preserving, however, some growth, especially when the principal leaves are down, above the buds to which the Vines are to be pruned, the final pruning being deferred until the early part of next month. The old surface soil should be removed and forked from amongst the roots, taking the opportunity of raising any that are deep and laying them in fresh material nearer the surface. Good calcareous loam is the most suitable, with a twentieth of crushed bones and wood ashes. If the soil be light add a sixth of clayey marl; if heavy, a sixth of old mortar rubbish. Charcoal is an excellent addition to the extent of a tenth. Give a moderate watering, and the roots will push, especially adventitious ones, from near the collar into the new soil above, and be in capital condition for a start when the time comes round. When lifting or renovating the border is deferred until the leaves are all down the start is not nearly so satisfactory.

Midseason Houses.—The Vines have done well as regards crop, but there is probably more shanking and want of colour in Grapes than usual. This may be an outcome of last year's cold, moist weather, and want of sun. The Grapes have been slow in acquiring bloom and colour, and though not so well furnished as desirable the berries are larger than ordinary, and are pronounced excellent in quality. Red spider has been rather troublesome, and though we have tried most remedies we find thinly coating the pipes whilst hot with a thin wash of sulphur and skim milk most efficacious. Copious supplies of water through a good surface mulching and occasional supplies of liquid manure of a sustaining rather than of a stimulating kind are most contributory to a satisfactory result. Madresfield Court is taking its place—the foremost of midseason Grapes. Fire heat has been necessary to secure the necessary ventilation by night as well as day and secure a circulation of air. The heat, however, has been kept down at night so as to give time and rest to Vines carrying heavy crops in order to perfect them.

Late Houses.—Continue to afford full supplies of water through a good surface mulching, and until the Grapes are well advanced in colour, for most late Grapes take a long time to perfect thoroughly; and some, particularly Mrs. Pince (which has a larger per-centage this year of stoneless berries than common), even after appearing finished, are not so up to the shank, which is often a consequence of too early stopping the supplies of food, and in some cases the result of a too short duration of the feeding is manifest in the Grapes shrinking. All late Grapes require time; they ought now to be colouring or advanced therein, and then they will, with a circulation of warm rather dry air constantly, attain a fulness of berry and a perfection of finish. Indeed, poverty of finish is the chief cause of shrivelled Muscats and others shrinking after they have hung some time. Afford a temperature of 70° to 75° by day artificially, 80° to 90° with sun, and close sufficiently early to increase to 90° or 95°. When the sun is losing power put on enough top and bottom air to insure a circulation; allow the temperature to gradually cool, which rests the Vines, and increase the ventilation early with the advancing temperature. The pipes should, if necessary, have a little warmth in them, to prevent the temperature falling below 65° at night.

THE FLOWER GARDEN.

Propagating Summer Bedding Plants.—An early start must be made with the propagation of various bedding plants in order to have a good stock for keeping through the winter. In many instances the cuttings are softer and more plentiful than usual, and no difficulty ought to be experienced in striking sufficient of them.

Tuberous Begonias.—Few realise how very easily these may be raised from cuttings. Now there are so many superior varieties that can be obtained from seed or bought at a comparatively cheap rate it is unwise to perpetuate the stock of inferior forms, and only the best, therefore, should be marked both for propagating and storing purposes. Any side shoots that can well be spared from plants either in beds or pots should be taken off-cut to a joint, the lower leaves being trimmed off, and then dibbled into a bed of sandy soil and covered with hand-lights; or if they are plentiful a few inches of sandy soil may be placed on a shallow bed of half-decayed manure in a frame and the cuttings inserted in this. They require no shade or bottom heat, and only enough water to prevent shrivelling. Earlier in the season cuttings will strike root in a sunny border as readily as Zonal Pelargoniums, but it is rather late to try this plan now. These late-struck cuttings will make no top growth, but will form small bulbs, which may be lifted, stored in dry sand during the winter, and when started into growth next spring will surpass, as far as vigour is concerned, any that may be raised from seed.

Verbenas.—Although not so much grown as of old they are still a

very showy class of bedding plants, and would be more often seen if healthy cuttings could be had in abundance every spring. Too much fire heat is responsible for numerous failures with Verbenas, but if a good stock of plants were raised in the autumn, and wintered in comparatively cool quarters, these would yield superior cuttings when wanted. Too often they are rooted thickly, and kept in a hard, starved condition through the winter in 5-inch pots, and these fail to produce the requisite soft, clean cuttings. The best plan is to at once prepare a frame, large or small according to the requirements of the garden, by placing in the bottom from 9 inches to 12 inches of half spent hotbed material, this being made firm and covered by about 3 inches of fine compost, consisting of loam, leaf soil, and silver sand in equal parts, and which when made firm and smoothed over with the back of a spade, is ready for the cuttings. Select quite young flowerless shoots, these being found springing from the centre of the plants. All should be cut to the third or fourth joint, and after the lower leaves are removed be at once dibbled out thickly. A gentle watering, or enough to well fix the cuttings and to thoroughly moisten the soil, ought to be given, the lights being then placed on, kept close for a time, and the cuttings heavily shaded from sunshine. They must not be hurried, but after they have recovered some portion of their freshness a little air may be admitted every warm evening, and in dry weather syringing every morning is beneficial. When struck, and before the roots are matted together, all ought to be placed thinly in boxes or pans filled with moderately rich loamy compost, and be kept rather close in a cold frame or pit till well established in their fresh quarters. Subsequently they should be well hardened, and kept during the winter in a cool house or dry pit.

Ageratums.—Although these come well from seed, cutting-raised plants obtained from a good stock are most to be relied upon for effect. Unfortunately they are apt to bloom so very freely that suitable cuttings for striking in August or the early part of September are not often procurable. What are needed are soft shoots without the bloom head being far advanced. These can be rooted in pans or boxes stood in a close frame, or the cuttings can be treated exactly as advised in the case of Verbenas. After August a little bottom heat is usually necessary for propagating these and various other plants. *Ageratums* may be wintered in a moderately warm greenhouse or pit, and the pots, boxes, or pans containing them should be well drained.

Heliotropiums.—If the advice has been taken of reserving a certain number of spring-struck plants for pot culture, these, in addition to affording a good late display of flowers, will yield abundance of young shoots when placed in heat next spring. Old plants do not lift well from the open ground, and if there are no plants it is advisable to attempt propagating some now. A mild hotbed is of good service in propagating these as well as other plants that will be mentioned. Select short young shoots, cut to a joint, trim off the lower leaves, and dibble them thinly into pans or well drained pots of fine sandy soil. Being kept close and shaded they strike moderately well, and may be wintered in any house from which frost is excluded.

Iresines, Coleuses, Alternantheras.—In each case the simplest method of providing a good stock of plants is to reserve the requisite number of spring-struck for pot culture. If the two former are duly transferred to 5-inch pots and pinched back a time or two, good bushy plants would be available for housing any time before cold frosty weather sets in. Four-inch pots are quite large enough for *Alternantheras*, the soil in larger sizes being apt to become sour. Failing this, well established stock tops from old plants should be rooted in gentle heat and kept in the store pots till the spring; five or six plants or cuttings being ample for a 5-inch pot. All should be wintered on shelves in a warm house.

Lobelias.—The dwarf bedding sections of these can now be had very true from seed, but there are many who still prefer to raise the requisite number of plants from cuttings of a superior named variety. For the purpose of wintering for stock purposes, plants raised from cuttings are preferable to old plants lifted from the open ground. Young flowerless shoots taken off and otherwise treated in every way as directed in the case of Verbenas, will yield a profusion of strong cuttings in the spring, or the plants may be divided freely. It is also a good plan to raise the requisite number of seedlings in the autumn rather than in the spring. The seed should be sown on the surface of a previously moistened pan of fine soil, covered with a square of glass, and set in a shaded frame till it germinates. Winter the seedlings on a dry light shelf in a cool house, and if prevented from damping off, thousands of sturdy plants should be available for pricking off long before it is possible to raise them in the spring.

Antirrhinums, Pentstemons, and Phloxes may all be raised from cuttings made from side shoots and treated similarly to Verbenas, being wintered in cold frames, or the seed of the two former may be sown in pans now, and the seedlings pricked out in the spring.

THE BEE-KEEPER

NOTES ON BEES.

THE HEATHER HONEY PROSPECTS.

PERHAPS not in the memory of man has the prospect of so large a yield of honey from the Heather been so great as it is at

present, nor can we recall a single year that bees gathered to the same extent in July. In a week's time from the 24th of that month good hives rose in weight from 50 to 60 lbs., almost filling to completion two covers of supers from 40 to 50 lbs. in weight, and the Heather not nearly in full bloom, nor will it be till about the 12th August, and will then continue for three weeks longer. We have had three days' rain; but now there are signs of finer weather, and should it continue for a fortnight it will result in one of the largest yields of honey ever recorded, and fully substantiate the necessity for bee-keepers to adopt full-sized hives.

It is a great mistake keeping bees in small hives when larger hives are storing in the body preparatory to the filling of many more supers than any undersized hive can possibly do. I am writing this on the eve of starting for the moors, where my bees will require constant attention. If fair weather sets in I have not the slightest doubt but strong hives when the Heather is in full bloom will gather 20 lbs. of honey daily.

STINGLESS BEES.

Some persons are surprised when they hear about the foreign stingless bees; but they will be all the more so when told that there are native stingless humble bees. These can be recognised by their white abdomen and yellow and black thorax.

THE LATEST OUP.

We are always glad to hear of anything new that is good, and always give credit to the discoverer or inventor. I have long advised youthful queens, not only for preventing untimely swarming, but for strong colonies, and am glad to know that some writers have benefited from my advice. It appears, however, that some editors do not agree with me, as one of these in a contemporary in reply to a querist says, "Young queens breed comparatively slowly for the first few months." This is not my experience, and what induced such an answer may be more readily imagined than explained. Young queens are as a rule not fertilised until the time the greatest laying is past, or at the time it is going on; and few young queens have an opportunity of laying to their fullest extent, being generally with second swarms or old stocks. I have practised for nearly forty years the system of introducing young queens to first swarms suspected of having effete queens; and never yet knew a single case where young queens improved in their laying after the first few weeks of their life. As to "months," no bee-keeper can test properly queens after July. It is to be hoped therefore that your readers will know from the above where to place reliance.

GARDENERS AND BEES.

Gardeners are more inclined now than they were a few years ago to combine the useful with the beautiful. Many gardeners are now bee-keepers on their own account, and many take charge of their employers' bees more cheerfully than was once customary. But there is another way bees are managed between employer and employed. The former provides all necessities, the gardener attends to the bees, and for this extra work the honey is equally divided between them. I know of one case of the kind where the gardener this year will get several cwts. of honey.—A LANARKSHIRE BEE-KEEPER.

A GARDENER'S EXPERIENCE.

I INTENDED writing to you ere this to thank you for your answers to my questions, as well as to let you know how my bees were getting on. I had a Sandringham hive from Messrs. Neighbour; it swarmed on June 12th; the swarm weighed 6 lbs., which I thought a very fair one. I put it into the hive I had from "A Lanarkshire Bee-keeper," giving it two boxes as advised, with nearly full sheets of foundation. By the 28th of June the two boxes were pretty well filled. I placed four of the small supers on the top, and when they were partly sealed placed four more on as directed. I examined them yesterday, and was pleased to find the first four put on nearly sealed over and the other four about half filled. I have not taken them to the Heather yet, the weather has been so bad of late, but as they are only one mile off some they are not taking any harm. My Lanarkshire hive has been much admired by neighbouring bee-keepers. They are quite surprised at the weight of it. I have persuaded one bee-keeper to do without excluder zinc; he is quite convinced that it is unnecessary.—C. R.

°° All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Exhibiting Grapes (Flr).—If the berries of the small and large bunches are equal in size, evenness, and colour, we should stage the larger if not very unshapely. You might have made their condition clearer if you had tried, as is apparent by your fragmentary letter.

Water Melon (W. S.).—The box and contents were crushed into a jelly-like mass, and we can only judge by a portion of rind that the fruit was a variety of Water Melon, several of which, as sold in shops, are inferior, but they vary; and as grown in frames in this country they do not equal the best varieties of Melons that are usually cultivated by gardeners.

Vine Laterals (W. E.).—If the fruit is swelling kindly thin the laterals, but do not remove them all, unless the main foliage is extra large. When the fruit is ripe and almost finished colouring, you may remove the most of them to give more light to the house, to enable the air to circulate more freely round the bunches, and to concentrate the powers of the plant more in ripening the wood. The reason for removing gradually has often been given of late. If removed all at once you would check the growth, and the fruit would not swell so well.

Terra Cotta Rose (H. E.).—As with the third box of blooms you failed to make clear what you appeared to wish us to understand, and as you mentioned that Mr. W. R. Raillem had commented on the variety when writing about Roses at the National Show two years ago, we sent the blooms to that gentleman, and his remarks thereon are published on page 138. The blooms from the Briar are larger than the one from the original bush, but the exact colour is not preserved. Whether it can be in plants from cuttings can only be determined by experience.

Luxuriant Peach Trees (E. Butler).—We presume that your wood was imperfectly ripened last autumn, and that and the frost together injured the fruit buds. That might be done and the wood buds break with great luxuriance, and then the vigour would be increased from there being no fruit to moderate its strength. In thinning, the weaker and middle-sized shoots should be retained, and the other strong ones taken away or shortened. If such thinning does not check luxuriance sufficiently, you ought to examine the roots, and either shorten or raise them early in September; doing so just so much as to check growth, but not to make the shoots flag seriously.

King of the Pippins and Golden Winter Pearmain Apples (H. O.).—The original and true King of the Pippins, which is exceedingly rare, is that described in the "Fruit Manual" under that name. The variety usually known in the markets under the names of "King Pippin" and "King of the Pippins" is the old Golden Winter Pearmain, the name of which was changed by Kirke, a nurseryman at Brompton, to suit some trade purpose about the beginning of this century. The time of ripening of Golden Winter Pearmain is given in the "Fruit Manual" as October to January, and this we have found is correct.

Pansies Dying (James).—The cause of the sudden collapse of Pansies cannot be exactly defined. It is a very old "grievance," and assuming the plants are established in good time and not twisted by the wind, there is either something in the soil that is injurious, such as grubs, or it is defective in some constituent that is requisite for the continued support of the plants. Those planted late in the spring are the most liable to "go off" prematurely, while they fail in one part of a garden and succeed in another. If you are especially anxious to grow them on the particular plot in which yours fail, you will not be likely to succeed unless you remove a great part of the old soil and introduce fresh of a suitable nature. This at least is what experience has taught us in failing and succeeding in growing these flowers. It is always the best to grow them in that part of a garden in which they "naturally do well."

Mignonette Failing (H. F. E.).—It is not safe to trust to Mignonette "sowing itself," and last year was especially unfavourable to the ripening of the seed. Nor can it be expected to grow and flower

satisfactorily on the same ground yearly without the addition of suitable manure. As your plants fail in the centre of the bed, and grow well towards the outside, it would seem as if the necessary constituents for the support of the plants were extracted by the previous crop. Moreover, the plants cannot be depended on to grow so well from seed sown in May as when raised earlier and take deep root before the occurrence of dry hot weather. To this, with poverty of soil, we attribute the failure. The ground should be liberally manured a few months before sowing, and have some lime pointed in the spring. We find sprays of other flowers in the box, but you make no reference to them in your letter. They are, however, named below, on the assumption they were sent for that purpose.

Keeping Black Hamburgh Grapes (R. O. S.).—The Grapes being now ripe it will be necessary, in order to retain them in good condition as long as possible, to keep them cool, allowing a free circulation of air night and day, and when the sun is very powerful it will be necessary to shade for a few hours in the hottest part of the day. Sprinkling the floors in the early part of hot days will also be beneficial. Sufficient water must be afforded the border, especially that inside, to maintain the foliage in good condition. The shading will only be necessary during hot days this month and early September. Keep the laterals closely stopped to one joint, and examine the bunches occasionally for decayed berries, which must be removed promptly. Fire heat will not be necessary for the next six weeks, unless the weather prove very wet and dull, when a little by day will be beneficial so as to admit a change of air, not raising the temperature by that means above 60° in the daytime, and turn off the heat early, so as to have the pipes cool before night. After September an equable temperature of 45° to 50° should be secured as far as practicable, and the Grapes will keep till November, probably later if they have been well finished.

Hydrangea paniculata (B. R.).—This plant can be readily propagated by cuttings of half-ripened wood taken from the plant after flowering and inserted under handlights placed on the shady side of a wall or hedge. Younger growths can also be employed for cuttings, and these will root quickly if inserted either singly in pots or a number together (the first method being preferable), and placed under handlights or in a close frame until they are rooted. If propagated in heat give a good watering after insertion and keep the cuttings close and well shaded afterwards until they are rooted; cuttings possessing two joints—one to be in the ground and the other just above the soil—will suffice. The chief secret of flowering this *Hydrangea* well in a pot is the thorough maturation of the wood. After flowering the plant should be hardened and placed outside, then in autumn or early spring should be closely pruned back; if one pair of eyes is left on the new wood that will be ample. By giving your plant greenhouse treatment after the new year you will be able to have it in flower by the end of the month of June. If required earlier it must be subjected to forcing; an intermediate temperature is best for this purpose, where a fair amount of air can be given daily when favourable to maintain a dwarf sturdy growth. If forced in a close warm house its growths will be weakly and may fail to flower; but they flower freely under a more judicious system of forcing.

Making Mushroom Spawn (A. M.).—No better time for making the spawn can be selected than the end of August and the month of September. Take, as materials, a barrowload of cowdung, rather stiff, and two barrowloads of horse-droppings, with a little short straw with them, and half a barrowload of fibry loam. Mix these up into a stiff mortar-like substance until it is pretty well incorporated and looks like grafting-clay. Then make a frame either of iron or wood, say half-inch boards if the latter, and in four pieces—that is two sides and two ends, enclosing a space of 9 inches long, 4½ inches wide, and 1½ inch deep. Then obtain a flat clean board and a bucket of water, dip the frame in the water, place it on your board, fill it with the prepared dung, strike level with a spade or trowel, and turn out the brick on boards, to dry on its flat side. In a couple of days make two holes in the bricks, but not going through—say three-quarters of an inch in diameter, turn the bricks until they are tolerably dry, then into each hole push a piece of good spawn, and draw a little cowdung or clay over it to prevent its falling out. Next make up a slight hotbed of litter, on which build these bricks in open honeycomb or pigeon-hole fashion, and cover over with litter, so that these spawned bricks shall have a temperature of from 80° to 85°, and not more. As the spawn runs, the bricks must be examined, and, as soon as they are filled with the gossamer-like white spawn threads, removed, and kept in a dry place until wanted for use. Some bricks or pieces will be ready to remove before others.

Peach Leaves Skeletonised (B. Hall).—The leaves which you have sent have not been eaten by any insect. The immediate cause of the injury to the foliage is scorching, but there may possibly be a more remote cause that has led to the evil. If you carefully examine the injured leaves, which at the first glance appear as if they had been eaten by an insect, you will find first a dark discoloration, then a shrinkage of those parts where the tissue has been ruptured, and which eventually separates from the healthy portions of the leaves, and thus form holes and fissures. If the roots of the tree were healthy and active and could obtain the requisite moisture for the support of the growth, the evaporation would not have been so disproportionate with the supply of sap, and the withering would not have occurred provided there was no fault in the glass that led to scorching. As a remedy we should first shade the tree, either by sprinkling limewash on the glass or

covering with tiffany, and syringe judiciously to keep the foliage fresh, then examine the roots and rectify any mistake that you may find there. The border may be too dry at the bottom, or the soil not sufficiently fertile, needing liquid manure, or the roots may have come in contact with something that has injured them. Examine also the stock of the tree, which may not be healthy, or the sap vessels may be too contracted. By some cause or other the supply of sap is insufficient, the sun extracting the moisture from the foliage faster than it is supplied by the roots. A close examination founded on these suggestions will probably lead to the discovery of the real cause of injury, and a remedy will possibly be dictated by the circumstances of the case. We have further to add that we have seen Peach leaves injured in exactly the same way by excessive fumigation, the material not having perhaps been the safest and best for the purpose.

Peaches Falling—Split Stones (C. R.).—There is more mishaps in Peach culture through the constituents and formation of the border than anything else, the borders being formed of too light and rich soil, too wide and too deep, so that the roots run riot in the open and stimulating material, making large leafage, which demands large supplies of sap to sustain the loss consequent on evaporation. This, when the trees are in full foliage, is considerable, and attains its maximum about the time the stoning of the fruit is completed. The fruit may stone satisfactorily, but it does not swell well afterwards, and ultimately drops or ripens prematurely—poor in flesh and, though juicy, is flavourless. This is the result of the defective supplies of food in the last stage of stoning and in the final swelling of the fruit. The remedy is a moist condition of the atmosphere—less air by day so as to lessen evaporation, combined with efficient and recurring waterings through a good surface mulching of lumpy manure. A firmer and more retentive soil is also essential, therefore we advise lifting the trees as soon as the leaves give indications of ripening, and adding some clay marl to the soil, making the border firm. The stone-splitting rarely appears in trees that have small flowers, being mostly confined to the large-flowered varieties, and it occurs equally with Nectarines as with Peaches. It is usually attributed to imperfect impregnation of the blossoms, but it is a fact also that lime containing much phosphoric acid is more beneficial in this case than that containing only a small percentage. Some lime contains as much as 7 per cent., and such when used as a source of calcareous matter has a decided effect upon the stones of fruits in preventing splitting. Iron also has a favourable effect, but the most satisfactory results attend in cases of this kind the application of mineral phosphates—i.e., coprolites, discontinuing the use of nitrogenous manures for a time, and even when the trees have sufficient vigour. Perhaps stone-splitting is as much a defect of soil constituents as of defective fertilisation; but until we have the result of some experiments we are making with a compound of phosphorus, iron, sulphur, &c., on Peaches, also Grapes, to elucidate some points in respect of shanking and non-colouring, nothing definite can be advanced. This is mentioned so that no reproach may attach to cultivators who have Peaches with split stones, as this occurs with the best of growers.

A Mysterious Vine Disease (G. T.).—The samples of laterals sent, small and hard like wire, with apologies for leaves having the appearance of being scorched and tanned, represent a disease with which we are quite familiar, and the cause of which is not determined. We have often had occasion to refer to it, and nowhere is it so well described as in Mr. Barron's "Vines and Vine Culture," as follows:—"A disease which seems to be either rare or of recent origin, for it is not described in any book we know, is a certain strange affection of the shoots and foliage, which—in lack of an authorised name—Mr. Blackmore of Teddington, who has directed our attention to this malady, suggests may be termed diphtheritis or lorification, for the parts attacked assume ere long the consistency of leather, and finally that of wire almost. The first symptom is a contraction of the margin of the half-grown foliage, till the leaf becomes like a cup inverted, then the stem loses its crisp clear substance, goes dull, and is channelled with lines of shrinkage. The tips of the shoots become flat and flaccid, all the gloss is lost, and the vigour gone; and the disease descends from leaf to leaf until the whole tissue is hardened, and the young wood becomes of a dirty black tint. The growth of the season is stopped, and the main stem instead of gaining in bulk is lessened. Young Vines alone, so far as our present knowledge goes, are affected by this disorder, but they seem to take it alike whether grown in pots or planted in their places. The roots appear to be perfectly healthy; the growth is robust and vigorous; the house has been managed as usual, there are no cold draughts or sudden changes, defects or excesses of temperature; but suddenly this disease appears, and Vine after Vine is afflicted. The malady is contagious, or at any rate epidemic. The symptoms seem to be distinct from all the recognised forms of mildew, and cannot be checked by the use of sulphur, yet further investigation may prove that it is of fungoid origin. The only treatment we can recommend is to cut below the parts affected, remove the tainted growth from the houses, and stimulate the Vines if they have strength left to form healthier foliage." You will agree that is an admirable description, but all the leaves on the weak laterals which are produced in a sluggish manner after the leading growth is arrested are not malformed, though in other respects this description applies. We suspect the disease is of fungoid origin, and we have never known it cured by any application, though many have been tried, but we have known healthy growth and strong canes to follow when the Vines have been cut down quite below the affected parts, though some we have seen affected to the base and

ruined. We now leave you to proceed according to your judgment as a competent gardener, and we shall be glad to hear with what result.

Names of Fruits.—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (*A Bristol Subscriber*).—We do not undertake to name Melons. There are many raised which have no recognised names, and when seed is purchased the names of the varieties are on the packets. (*C. M.*).—The Apple resembles the Red Hawthornden, but the characters are not developed.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*H. F. E.*).—1, *Oxalis corniculata rubra*; 2, *Lycasteria formosa*; 3, *Euphorbia Lathyris*. (*H. O.*).—1, *Pancratium fragrans*; 2, *Achillea Ptarmica flore-pleno*; 3, *Insufficient*; 4, *Adiantum assimile*; 5, A crested variety of *Adiantum cuneatum*. (*A. F. S.*).—*Adiantum scutum*. (*W. H.*).—*Miltonia Regnelli*. (*W. O.*).—*Lycaste fulvescens*. (*G. S.*).—*Tecoma radicans*. (*R. S.*).—*Euphorbia Lathyris*, the Cape Spurge.

COVENT GARDEN MARKET.—AUGUST 14TH.

Soft fruit is now finished, and our market is settling down to a quiet trade. Supplies of indoor fruit heavy.

AUTUMN TILLAGE.

AMONG the manifold advantages of clean land, the facility of prompt and timely tillage is by no means the least. Without foul perennial weeds to hinder, each process of husbandry becomes comparatively light, easy, and inexpensive, and we are able to keep always well abreast of our work. Two or three weeks ago the Yellow Suckling (*Trifolium minus*) was harvested for seed; as soon as it was carted the land had a heavy dressing of pig dung, which was at once ploughed-in, the carting direct from the yard, spreading and ploughing all going on together; a Cambridge roller was then passed over the field, and it will be so left in readiness for Wheat sowing in September. This work was nicely out of hand before the general harvest began, and the advantage of thus having land ready for the seed drill in autumn is very great. The Trefoil is given as a familiar example of everyday practice, but there are other crops, such as winter Tares and first-cut seeds, which are cleared sufficiently early for the land to be available for a similar purpose. It will be apparent that our aim here is to enforce a principle, and not simply a way to provide for the early sowing of Wheat.

Autumn tillages point more to a steady and persistent effort to have the land clean, whether we require to turn it to account for winter corn or catch crops, or not. In a season so favourable to growth as this has been the majority of stubbles will be foul, and by bringing the broadshare or paring plough quickly into use the seeding of Thistles, Hog-weed, Cotton-weed, &c., will be prevented, and much labour in hoeing next spring avoided. Seedling Couch Grass, too, will be destroyed, and the spreading of its roots deep down in the soil prevented. Charlock seed of the current year's crop which has fallen upon the surface will also be started into growth. Sometimes the harrows may follow the broadshare at once with advantage, but all such work is necessarily affected by the condition of the soil. Once get rid of superficial growth, and then let the ploughs follow as quickly as possible. We often envy light land farmers, who are able to turn over their land so easily with double or two-share ploughs drawn by two horses. The present season is a most favourable one for them—their crops are excellent; they will all be off the land long before those of heavy land farms, and they certainly ought to derive full advantage from early autumn tillage. Three or four stout able lads well accustomed to horses get through much of such work while the men are at harvest. They should be looked closely after, and encouraged by extra pay and example to do their utmost to push on the work. A healthy spirit if emulated should be fostered among them, and while urging them to activity due care must be taken that there is no ill-treatment of the horses. A lad who was seen flogging a horse badly, in reply to remonstrance said he had charge of the horse and should do as he pleased. He had to be temporarily suspended from duty before he could be brought to his senses.

When the manager of a home farm is so fortunate to have his own steam tackle it can be turned to full account at once to break up the stubbles, but it must not be forgotten that the cultivator requires to be followed by the harrows and heavy rollers to get twitch out of the soil, and it is well to leave each field in as suitable condition as we can for the next crop. To do this in the best way horse and steam power are often used in the same field. The doubtful nature of spring weather has to be remembered, and the soil that is not to be sown till then is when cleaned either ploughed simply in the ordinary manner, or it is first ridged, and then the ridges are split into other ridges by the double-breasted

plough and so left. Then when seed time comes round again in spring we have only to harrow down the ridges to have a fine seed bed quite ready for the drill, and the corn sowing is done both quickly and well.

Very much of autumn tillage is therefore prospective, as indeed so much of the farmer's work must be if he would turn his opportunities to full account. But much good work may yet be done for the present season in view of sowing such catch crops as white Mustard, Cole, stubble Turnips, Kale, Cabbage, and *Trifolium incarnatum*. For the latter crop we have only to take the first clean stubble available and sow the *Trifolium* broadcast, following with the harrows once or twice as appears necessary. If sown at all it must be sown early in order to have a full plant well established before winter. Wherever it answers it is highly valued for the early supply of forage it affords in spring. Mustard sown now depends upon showers to induce germination and sufficiently strong growth to render it useful for folding in autumn, and the crop is decidedly a speculative one, but is nevertheless well worth trying for.

WORK ON THE HOME FARM.

Harvest is now in full swing, and all that is possible must be done to save the corn in sound condition. Much of it is sadly beaten down, and the work of reaping and binding is proportionately laborious. In many fields self-binding reapers are quite useless, and even the ordinary reaper cannot always be used. All this tells upon the cost, and also hinders the work. Very much of the Wheat comes down in excellent order, and the samples are likely to be good enough to compete fairly well with foreign corn. Oats are good generally, and care should be taken to cut them early. The corn is riper than the straw, and if tied into sheaves they must be left a long time in shock and turned at least once. We prefer not to tie Oats, but to mow in swathes and turn them, taking care to cut only when dry and well harvested, so as to avoid all risk of overheating in stacks. There is no doubt that many Oats are spoiled by mismanagement, and yet only ordinary care and judgment are required for them.

To bind Barley or not is an open question. If left till quite ripe, as it always should be, it is best—i.e., more safe, if the weather is at all unsettled. So far Barley has not suffered, and with fine weather now we hope to have a fine bright sample such as maltsters love. Maltsters have had to use so much imported Barley of late that fears have been entertained of serious permanent harm to the market for home produce. But it is generally conceded that imported Barley is decidedly inferior to the best British grain, and we believe the climate of this country to be especially favourable to the production of a superior sample if only we can have fine weather for the ripening and harvest. Whenever corn is tied let there be no slovenly shocks, but have the sheaves well set up to throw off rain as it falls. We have already seen much slovenly work in shock building this season. Let the shocks be small, the sheaves leaning inwards slightly, and the rows run from north to south, so that they may dry quickly. Make good substantial stack bottoms, build carefully so that there is no risk of the stack leaning over in any direction, and take especial care always to leave the middle of the stack full, so that the rick cloth may throw off rain as it falls.

REMARKS.

- 4th.—Fine morning; dull and close; rain at night.
 5th.—Heavy showers at 10.25 A.M., 0.45 and 5.30 P.M., and generally bright between.
 6th.—Generally bright and fine, but two or three slight showers.
 7th.—Bright and fine.
 8th.—Fine and generally bright.
 9th.—Cloudy morning with showers; wet afternoon and evening.
 10th.—Fine, with some sunshine in the morning; bright afternoon.

An unsettled week. Temperature nearly 5° below that of the preceding week, and very near the average.—G. J. SYMONS.

REFERENCE was made in a short note last week to this project, but its importance demands more prominence than has yet been accorded. Exhibitions of flowers are beautiful, and conferences in connection therewith interesting and instructive. From time to time the special gatherings have not only given satisfaction to those who participated in them, but have been the means of eliciting information; and this, being disseminated, has been of service to the flower-loving community, which we are glad to believe is increasing rapidly year by year. Congresses on fruits and representative samples of the different varieties have been similarly acceptable to a large section of the horticultural public, and there cannot be a doubt that knowledge thus concentrated, then reflected to the world through the Press, has been of substantial value to numbers of persons, and these are also happily increasing, who are engaging in the cultivation of hardy fruit. It is fitting that the Royal Horticultural Society should not only countenance but give distinct encouragement to every section of the great industry of which it is the national exponent. This in fact is the keynote of its charter—the advancement of horticulture both useful and ornamental, scientific and practical. At no time was the disposition greater to fulfil all obligations incurred by the Society than at the present time, and as far as means allow to carry out its functions; but whether the methods adopted are the best is a question that is fairly debatable. As is apparent by a perusal of the last issue of the Society's Journal the scientific and the ornamental have had a fair share of attention, and now comes the turn of the "useful and practical."

A vegetable conference, though the term is a misnomer, was due to preserve the balance of the Society's operations, and is now in a fair way of being realised. It has been alleged that the same energy has not been exerted in the furtherance of this gathering of an essentially useful character that was displayed in the preparation of the Orchid and some other special gatherings of an ornamental nature. It would be difficult to show, perhaps, that great activity has prevailed in the Council in pressing the claims of the coming Conference of vegetable growers and patrons on the gardening world. We are not able to fully acquiesce in the allegations we are bound to hear, that the Council is an Orchid Council, a Daffodil Council, an Auricula and Carnation Council—in fact, anything but a useful Council, because it may possess all the floral proclivities indicated and still be useful and practical, as there cannot be a doubt it ought to be. It is to be remembered there are now gardeners on the Council Board, and it may be fairly expected that they will exert themselves in the furtherance of useful practical gardening. The overwhelming number of professional gardeners in this kingdom are not specialists; if they were they would not occupy the positions they, as a body, fill so well; nor are the majority of them who are Fellows of the Society, and it is gratifying to observe these are more numerous than ever, specially interested in a particular family of plants. Their duties, and the demands on their skill, compel them to take wider views of their calling than is thus implied, and the department of all others in which they are most deeply concerned is that which may be designated by the term comestible. The great work of gardeners therefore should be encouraged with the same zest that the work of the florist is, no matter what his "favourite flower" may be.

It is reasonable, then, to expect that those members of the Council who are gardeners will fully and fairly represent the craft to which they belong, and not only follow, but lead, as necessity may arise, in those matters in which their confrères outside are most generally interested.

It is not suggested that the gardeners' representatives have not given the best support they could around the Council table to the useful project under notice, but we understand that neither they nor their distinguished associates have been by any means regular attendants at the Committee meetings at which the business pertaining to the Conference has been conducted, though we think members of the Council have an inherent right to attend all committees, and their presence is naturally encouraging, whilst it indicates their earnestness in the work in hand. It is not given to all men to have the broad sympathies of the Secretary of the Society, who gives his strong support to everything that is promulgated under its auspices, and who works assiduously in its interests, but something seems to be expected that is not forthcoming from other members of the directing body in giving, not passive sanction, but active support to whatever may be under consideration by special committees. The Vegetable Conference Committee is undoubtedly fortunate in its Chairman, who admirably exemplifies the force of the dictum that the busiest men have the most time, and we hear he has been well supported by his coadjutors; and during his absence from London over the next few weeks his excellent deputy, Mr. Shirley Hibberd, will, it is safe to say, be equally supported in doing all that can be done in making the Conference worthy of the Society, of the historic garden in which it will be held, and of the cultural and critical skill of British gardeners.

There can, we think, be no question, generally speaking, for there are necessarily a few exceptions, that the vegetable supply, as represented by the greatest variety of the best quality in season, is the most important part of the gardener's duties; and that being so, he should as far as possible become acquainted with the different varieties, "strains," and selections. It may be expected that the seedsmen will take care that their specialties will be represented at Chiswick on September 24th, but that is not enough to make the event satisfying, and private gardeners should contribute samples of what they consider good, not for the purpose of winning prizes, but for comparison, the determination of nomenclature, and for educational purposes generally. It will be creditable to share in such work with such a worthy object in view, and no one can associate himself with it and be the worse for the effort. Few can do so without gaining knowledge, and none without imparting it to others. That alone will induce gardeners to co-operate, for one of the brightest and most prominent traits in the character of "brothers of the spade, the knife, and the pen," is their readiness to help each other in the vocation in which they are engaged.

The display of vegetables will not be competitive, but representative. The schedule is before us as we write, and with the object of inducing gardeners who may be desirous of co-operating to send to Mr. Barron for a copy we briefly indicate its scope. It is divided into six sections, and as it is right to give credit where credit is due, the plan was adopted on the proposition of Mr. Hibberd:—**A**, Green vegetables, including Cabbage, Savoy, Cauliflowers or Broccoli, Borecoles or Kales, Brussels Sprouts, Globe Artichokes, and Spinach. **B**, Fruits or Pulse:—Vegetable Marrows or Gourds, Cucumbers, Tomatoes, Beans, Peas, Capsicums or Chilies, and Egg Plants or Aubergines. **C**, Tubers and Bulbs:—Potatoes, Jerusalem Artichokes, Leeks, Onions, Shallots, Garlic, Turnips, and Kohl Rabi. **D**, Tap-roots:—Beet, Carrots, Parsnips, Horseradish, Stachys tuberosa, Salsify, and Scorzonera. **E**, Saladings:—Endives, Lettuces (Cos and Cabbage), Celery, Celeriac, and saladings. **F**, Miscellaneous:—Natural vegetable garnishings for kitchen use, Cardoons, Leaf Beets, seed pods, small bulbs, &c., for

pickling and other culinary purposes; Parsley, flavouring herbs, Mushrooms, and other edible fungi, new vegetables, and vegetables comparatively unknown. The enumeration indicates the comprehensiveness as well as the simplicity of the scheme, and as only small quantities of each are asked for—an ordinary dish, as stipulated—the greatest number can contribute of what they have in presentable condition at the time.

There is no appeal to mercenary motives in this Conference. It is based on altogether higher ground than that, and there are plenty of men in the gardening ranks who, though not rich in this world's goods, will respond from a feeling of loyalty to the craft they adorn; but though no prizes are offered, "certificates of merit will be awarded in each class to well-grown examples as standards of excellence," and these will be worth possessing.

Yet, though no prizes are offered, we should like to see what we do not observe in the schedule—namely, a certain number of medals placed at the disposal of the examiners for complete collections of vegetables as representing the current supply in the gardens in charge of contributors of such collections. This would not be competitive, any more than collections of plants at the Drill Hall are, and for which medals are recommended at every fortnightly meeting. Surely gardeners who give evidence of their foresight and cultural skill in the manner suggested are at least as worthy of receiving such honours as are growers of plants for sale, who in other ways derive profit from their exhibits, or they would not, perhaps, be so freely displayed. This idea is respectfully commended to the consideration of the Council of the Royal Horticultural Society, and if they cannot, on reflection, see anything in it, we suspect the gardeners of England can, and in that term is included the equally good men of Scotland, Ireland, and Wales. Why should growers of plants and flowers who admittedly, and properly in the way of business, exhibit at the Drill Hall for gain be honoured with medals for benefiting themselves while gardeners who contribute useful produce to the Chiswick conferences for the benefit of others have none? That they will contribute there is no doubt, and all the more honour to them for their disinterested efforts; but so long as the distinction continues it will be an anomaly, and anomalies will become increasingly unpopular unless we misinterpret the signs of the times.

We had written thus far when a digest of the proceedings came to hand, and that portion of it which is not embodied in the foregoing remarks is appended:—

"For the selecting of the best types of the several products exhibited committees of experts will be appointed, who will report upon those considered the best adapted for general cultivation both for profit and high quality. The reports will be made public for the general advantage when they have received the imprimatur of the Council. In the conference free discussion will be invited on the proposals made in the several papers to be read. These include the following subjects, to be introduced by the persons named in connection with them:—'Asparagus,' by Mr. Shirley Hibberd; 'Winter Salads,' by Mr. Norman; 'Food of Vegetables,' Mr. J. Wright; 'Improvement of Peas,' by Mr. T. Laxton; 'Improvement of Potatoes,' Mr. A. Dean; 'Vegetable Supply Throughout the Year,' Mr. J. Smith of Mentmore.

"On the first day, September 24th, the proceedings at Chiswick will be followed by a gardeners' dinner at the Cannon Street Hotel, Mr. H. J. Veitch in the chair; on the second day, September 25th, the reports of committees will be presented; on the third day, September 26th, the larger questions of improving the products of the vegetable garden will be discussed. Mr. Harry J. Veitch is appointed Chairman of the Conference, Mr. Shirley Hibberd Vice-Chairman. Schedules and all other particulars are obtainable at the offices of the Royal Horticultural Society, 117, Victoria Street, S.W.; or of Mr. A. F. Barron at the Society's garden, Chiswick."

As we observed last week, now the scope of the Conference is made known, it may possibly be in time for enabling gardeners and

others interested in vegetable products and the proceedings indicated, to make arrangements for visiting the metropolis on the dates above named.

CAMELLIA BUDS FALLING.

THE principal cause of Camellia buds and flowers falling is unripened wood. From the time the wood has lengthened out and the flower buds have commenced forming the treatment of the plants should be gradually changed. A close, warm, moist atmosphere, with shade from the sun, suits them admirably during the season of growth, but must be discontinued by the time the foliage has become firm and leathery. When it is in that condition admit more light, maintain a drier atmosphere, with more air until full ventilation can be given. During spells of dull, damp, sunless weather artificial heat may be employed during the day with ventilation. At night the house should be kept cool. This is not necessary for plants that are assisted to make and complete their growth early in the season, for those subjected to this treatment invariably retain their buds and flowers until they fall in a natural manner. On the other hand, plants that make their growth under almost natural treatment, except that they are shaded from the sun, and often unduly so, frequently cast their buds. If the autumn prove unfavourable the wood has very little chance of becoming firm and ripe. Devote every attention to plants in this condition, for chances of success are remote unless the wood is thoroughly brown to the base of the flower buds before they are half developed. The best means of avoiding the buds falling through unripened wood is to push the plants into growth as rapidly as possible after they have flowered, and not allow them to move forward under natural conditions. More light should also be admitted to plants that do not flower before April and May than is necessary for those that flower earlier and have all the best months of the year in which to mature their wood. The fact must not be lost sight of, that it is easier and safer to force the Camellia during the season of growth than after the buds have formed.

It is a common practice in gardens, especially with those who have limited glass structures at their command, to turn plants outside during the summer months. Many evils result from such treatment unless the utmost care is exercised. A light but shady position is generally selected for these plants outside. We have seen them arranged under trees, and no more injudicious treatment can be followed. Those who have plants in shady positions would act wisely in removing them at once to an open sunny spot, where they can be shaded only from rough winds. If the plants will bear full or nearly full exposure under glass the force of the sun proves beneficial, not the reverse, outside. A sunny spot is necessary to ripen the wood sufficiently to enable the plants to retain their buds and flowers. All that is needed when the plants are exposed to the sun is the protection of their pots on the sunny side, either by plunging them, or using old mats or any other material to break the full force of the sun.

Plants that have been outside for some weeks or months are greatly benefited by night dews, and require in consequence the most careful treatment after they are first housed. Special treatment must be given them and the internal atmosphere made to correspond as nearly as possible with what they have enjoyed outside. The higher temperature and drier atmosphere of a glass structure is sure to prove injurious. The change is too sudden, and frequently is sufficient to cause the buds to fall. Keep the house at first as cool as possible, moist, and the plants liberally syringed; in fact, any change in their treatment should be of the most gradual description. Too much care in this matter cannot well be exercised. On no account discontinue syringing suddenly, or raise the temperature, and discontinue the supply of moisture in the atmosphere during the swelling of the buds.

Strong stimulants in any stage of growth do more harm than good, and if practised after the buds have set they are very liable to fall. Overfeeding must be avoided. Weak stimulants prove beneficial, and are most needed by the plants during the time the flower buds are swelling. Do not discontinue the application of stimulants suddenly, but give them it weaker until it can be omitted without the least fear of the plants suffering.

Bud-falling is sometimes due to the poverty of the soil in which the plants are grown. Feeding in such cases must be practised, but it is infinitely better to supply the plants with a quantity of fresh soil than to leave them dependant on liquid or artificial manures. If the plants are grown in pots or tubs this difficulty can readily be overcome by placing them into others of a larger size or giving rich top-dressings annually. If planted out dig round them and place fibry loam, in which a few bones have been mixed, close to the roots, so that they will have an opportunity of

entering it at once. These operations are best performed directly after flowering.

Dryness at the root during the period of bud development is a certain cause of failure. Whether grown in pots or borders the soil should in no stage of growth become destitute of moisture. On the other hand, they must not be overwatered. One evil is as bad as the other. Even if the borders are well drained it is possible to overwater them. Sour saturated soil will result in the buds falling as quickly as dryness. Plants that are thickly infested with scale generally cast their buds or flowers. These, however, can be destroyed by the aid of petroleum and water, but it must not be used too strong. Strong insecticides must be strictly avoided from the time the buds commence swelling. Three ounces of the oil to four gallons of water will destroy scale and do no harm to the buds. It is much wiser to give the plants three or four applications rather weak than one very strong.

The Camellia during the swelling of its buds resents dry fire heat and undue forcing, which are certain to result fatally. When it is found necessary to employ fire heat either to ripen the wood or to induce the flowers to open it should be applied very gently at first and gradually increased. The syringe should also be freely used.—CULTIVATOR.

FRUIT TREES AND APHIDES IN 1889.

My own observations made this summer in many gardens and orchards, coupled with the statements of friends resident in a variety of localities, lead me to think that the injuries caused by aphides to our more important fruit trees equal, if they do not exceed, the mischief done by caterpillars. Caterpillars, as a rule, confine themselves to the consumption of leaves or leaf buds; now and then they may eat immature fruit or gnaw young wood, but this rarely happens. Aphides, spreading themselves over trees in multitudes, do a greater amount of damage from the persistency of the drainage they make upon the sap—the life blood of the tree, also they clog up and obstruct the breathing apparatus by the secretion popularly called honeydew. Nobody, I think, doubts now that caterpillars, and some other insects feeding similarly, do visit trees and plants that are quite healthy, but there are still those who consider that certain species of smaller size, such as “scale,” thrips, and aphids, attack chiefly, if not solely, those that are in a weakly or unhealthy condition. As I have previously remarked, two things were in favour of an extensive aphid visitation this year—a lack of vitality or vigour in our fruit trees, attributable to the ungenial season of 1888, and the dryness of the early spring of 1889, which proved very favourable to the rapid increase of the aphid tribe.

Another circumstance, perhaps, which may have led the aphides to seek an abiding place in our fruit trees sooner than is their wont was the backwardness of the season, which retarded the growth of a number of the wild plants, upon which several of our garden species reside during the spring. In consequence of this, I presume, colonies of aphides arrived on fruit trees, Beans, Cabbages, and other garden plants before the period of the first general migration—viz., May. An extensive migration did occur then this year, on some days presenting those peculiar atmospheric conditions which make people say “there is a blight in the air.” True enough, for aphides travel from plant to plant within a limited range—not only so, they at such times go several miles, feeble on the wing as they seem to be. Since last May I have noticed other and partial migrations, indicating much activity amongst them, hence 1889 must stand out prominently as an aphid year. There will, of course, be a second general migration about September. I believe some of the special insect foes of aphides have this year been less numerous than usual, as for instance the seven-spotted ladybird (*Coccinella septem-punctata*). This large ladybird is one that follows in its migrations, and, both as grub and as beetle, feeds upon the insects in orchards, clearing off quantities, since it can if so inclined kill thirty or forty of them without a pause. Then there are a host of minute flies in the genus *Aphidius*; the females of these deposit their eggs on the bodies of aphides, and the grubs gradually devour them. But the aphides have unfortunately a tiny parasite, which destroys many of them, and which is therefore a friend of the aphides. It is very possible this parasite has been plentiful this season, lessening in consequence the useful operations of the aphid destroyer. Some difficulty in distinguishing the species of aphides is due to the fact that they are so unlike at times in their winged and wingless forms, and besides that the wingless females of the early months are occasionally very different from those of the autumn broods. There could be no doubt, however, as to the abundance of the Cherry aphid (*Myzus Cerasi*), found also on the Plum, and to which the popular epithet “dolphin” seems to apply, from the resemblance this species bears

to the black “collier” or “dolphin” which visits our Beans. The Cherry aphid is one of the first species to make itself conspicuous, attacking the buds and young shoots. Whether it does invariably quit the Cherry at some migration period I cannot say; very likely it is the case—if so, it doubtless infests subsequently another tree or plant; for migration, as I have stated, generally implies not only change of place but change of diet. This too familiar aphid is black and smooth, only the last brood of the season being brown or yellowish brown. Then the profusion in which *Aphis Pruni* appeared—not merely on Plum, but on Pear and Apple as well—is beyond all question, and it is still too common. This species is always sheltered by a mealy powder, which they exude from their bodies; these are oval and attenuated. Though in colour this aphid varies from yellowish green to pale brown, the green is so far predominant that it is commonly styled the “green fly.” In their winged state the females have the body spotted with black; the head, antennæ, and thorax are also black, and the wings rounded, and of such a breadth that they can fly fairly well. I find positive evidence that this species infests some years both the Chrysanthemum and the China Aster. The latter plant, should the attack be neglected, is killed by the enemy, which, forming a dense crust round the base of the flower stalk, disfigures, and then turns it black.

Myzus Persicæ, an aphid which prefers the Peach and Nectarine, in some few districts showed itself upon the Apple. It is while young of a rosy hue; this is due to minute globules of oil under the skin. The legs and head are green; in the winged form the colour varies from greenish brown to black. But the chief enemy of our Apples was *Aphis Mali*, appearing also to a small extent on the Pear. One curious circumstance in the history of this aphid is the first brood (which have been called “queens” of the family) are larger than all the later ones, grey and mottled with green. Subsequently the broods are yellow, bright green, reddish, or brown, changes often depending on their moults; but they are usually powdered with white mealy particles, like *Aphis Pruni*. When winged they most appear in black and green. As many times been detected in the crevices of the bark, there is not a doubt the species winters on the trees, hence the advantage of washes that may either remove these, or so impregnate the bark that the young aphides are killed before they can crawl to the spring buds. This was the species which, in some orchards, did so much damage to trees which had been previously exhausted by a visitation of caterpillars. The Hop aphid, or a variety nearly resembling it, called *Phorodon Malahab*, occurred in Plum and Apple in May, but not, so far as I am aware, in unusual numbers. This is a small aphid of green hue, body rather transparent and frequently glossy; when winged it is spotted with black. When summer has fully arrived this species will generally be found to have quitted the fruit trees. The well-known woolly aphid, questionably called American blight, or *Schizoneura lanigera*, has not been particularly complained of this season, and owing to the better management of our orchards it is a pest which will probably decrease.

Many readers will have noticed on some of the sunny days we have had lately that there are largish grey flies hovering at about the level of 4 or 5 feet from the ground, now and then rising higher, all the while making a sonorous hum. They are flies of the *Syrphus* group, and busy now in depositing eggs, larvae hatched from which will prove by-and-by to be most assiduous devourers of aphides. These larvae or grubs are footless, leech-like in form, and advance along the leaves by the aid of tiny hooklets. Though blind, though show no difficulty in seizing their prey, of which they only suck the juices, and toss away the carcasses. Some of the aphides are carried off by certain species of wild bees, which construct their nests in banks or hollowed stems, and then store them with these insects to supply the young with food. It may be regarded as one reason amongst others why ants should be discouraged in gardens, that they act a friendly part towards aphides rather than a hostile one, but it is doubtful whether, as some naturalists consider, they do at all times collect eggs of the root-infesting aphides in autumn, and distribute these the next season in spots suitable for their growth.—ENTOMOLOGIST.

CARNATION EXHIBITIONS—OLD AND NEW.

ONE of the most interesting incidents of the recent meeting of the Carnation and Picotee Union at Oxford was the statement made by Mr. E. S. Dodwell at the luncheon, that it was sixty-one years ago when he saw for the first time an exhibition of Carnations and Picotees. He said that he witnessed the sight of some fourteen or fifteen old gentlemen sitting round a table on which was placed from thirty to forty blooms. This was going back to 1828. It would appear that in those days there were classes for

single blooms only, and the varieties in cultivation being no doubt somewhat limited in number, but few flowers were staged for competition. Coming down twenty-five years later, the "Midland Florist" for 1847 gives a report of a Carnation Show held at Derby, and the leading class was for eleven blooms, consisting of Carnations and Picotees both, the veteran grower Mr. E. S. Dodwell having been placed first. The scarlet bizarre shown in this stand was Easom's Admiral Curzon. This remarkably fine variety, still almost unsurpassed for brilliancy of colour when seen in its best form, was rightly regarded at the time as "one of those large leaps in advance which seem to defy all efforts to surpass." That this particular variety should be cultivated for forty-five years after being sent out, is one of the highest testimonies which can be borne to its excellence. It was shown in fine condition at Oxford, and will be grown for years to come, though such modern flowers as Arthur Medhurst, Fred, George, Robert Lord, and Robert Houlgrave have become formidable rivals to it. The latter is regarded as surpassing it in brilliancy of colour, and it is probably a seedling from it.

Some other old flowers that still find a place in collections and occasionally on the exhibition table are S.B. Ely's Sir Joseph Paxton, sent out in 1851, one of the latest productions of a successful raiser; C.B. Hine's Black Diamond, which first bloomed in 1848; C.B. Ely's Lord Milton, sent out in 1836, and though grown for over half a century is yet termed a good grower; P.P.B. Sarah Payne (Ward), sent out in 1847, and respecting which Mr. Dodwell states that "in its way it will never be surpassed," this was very finely shown at Oxford; P.F. Mayor of Nottingham (Taylor), was also shown in good character of Oxford, has been in cultivation thirty years; P.F. Premier is now but little grown, but it was raised at Derby by Mr. Dodwell's old gardener Will Wood in 1837, and is still to be found in collections. Another very old P.F. is Squire Meynell (Brabbin), which first bloomed in the neighbourhood of Burton-on-Trent in 1831 or 1832; in its best days it was indeed a grand variety, and even yet will reward the patient cultivator with glorious flowers; S.F. Sportsman (Hedderley) originated as far back as 1855 as a sport from S.B. Admiral Curzon, and maintaining its character is still exhibited in very fine condition. Among the rose flakes shown at Oxford was Sybil (Holmes) a very charming Carnation, sent out in 1873, and like most of the R.F.'s early in blooming.

Now, seeing that Mr. Dodwell puts the ordinary life of a Carnation at from twelve to fifteen years at most, it is remarkable that the foregoing flowers should have remained in cultivation so long, like some Auriculas that yet hold their own after being leading varieties for years, and the fact that they are still grown serves to show that the cultivation of named varieties of Carnations by florists does not impair their constitutional vigour as is sometimes assumed. The cultivated Carnations are among the hardiest of plants, and will bear a great deal of exposure during the winter. I think if anyone has doubts upon this point, and upon the wisdom of coddling the Carnation, as it is sometimes inaccurately termed, and will go among the florists and study their ways and methods of working, they will come to heartily sympathise with them. The leading spirits of the Carnation and Picotee Union repudiate with emphasis what once were undoubtedly the hard and fast lines of an older generation of florists. The late Rev. George Jeans forty years ago pulverised once and for all future time previous ignorant dogmas, though he did not, and probably no mortal ever will, abolish a succession of ignorant men.

Our newer exhibitions—those in London, Oxford, and Manchester—are doing much in the direction of giving impetus to Carnation culture; but in the country the culture of this flower for exhibition purposes appears to be fast dying out. I have seen several shows of late where prizes are offered for Carnations and Picotees, only to find the most sorry flowers staged, and with a view of giving encouragement to their culture judges are sometimes constrained to give prizes to flowers of inferior quality. It is not that they lack the assistance of the dresser, but the blooms are small, the grounds impure, the beading to the Picotees irregular and ragged, and the petals of the Carnations blurred and partly run. We hear so much in the present day as to the popularity of the Carnation and the extent to which it is grown, that it is matter for wonder better flowers—blooms more worthy of the name of Carnations—are not seen at country shows.—R. DEAN.

TREATMENT OF SOILS AND MANURES.

To find a subject that is not thrashed out by the numerous correspondents to your valuable Journal is no easy task, but I think I see an opening for a few remarks on the treatment of soils and manures—a twin question of considerable importance. I do not feel equal to the work of giving instructions to the scientific, yet

there are many gardeners who are not scientific to whom what I may be able to communicate may not be unacceptable.

I will first ask why it is that as good vegetables are not grown so well in gardens generally as by the few who pride themselves in carrying off the chief prizes at the various shows? There are many difficulties that beset the efforts of the gardeners. One is a lack of the necessary assistance to work the ground properly and to give the requisite time to the vegetables; other details are insufficient manure and gardens overgrown with trees. Unless a head gardener has sufficient experienced helpers to carry out his instructions everything cannot be made a speciality of. I do not care how experienced he is, some things will go wrong then; yet everything to which he is able to personally attend shows the touch of the master hand. Some men concentrate their energies in growing good vegetables, some good Grapes, others good Chrysanthemums, and could the all-round gardener take the lead in every operation everything would be satisfactory, uncontrollable obstacles permitting, except where the cook comes in.

I shall prescribe two courses of procedure, and recommend the adoption of both where practicable, the latter where help is short. The ground that is cleared of Potatoes and other crops should be manured well and dug at once. The advantage of this is it clears the earth of weeds and clears the yard of manure. Oxidised soil is turned in, the unoxidised is exposed to the action of the air, and while other work is being done this dry ground is helping the gardener; all the more important constituents are stored up, the heavier ones are washed down into the soil below, and the volatile either remain where placed or evaporate into the soil above, and all to unite with any of elements present for which they have the greatest affinity, or practically the manufactory of vegetable food is taking place naturally.

As the opportunity offered itself I would take each piece of ground in rotation, judging by the condition of the subsoil whether I would trench it or only bastard trench. In the former case I should spread the manure on the top spit turned in, and in the latter dig the manure into the bottom of the trench, as required for deep-rooting plants; but I think all ground ought to be trenched every year. When applying manure in the first case it should only be used when well decayed and in a semi-dry state. There is ten times more nitrogen in manure that has been properly prepared than when neglected, and when decayed it is better distributed in the soil, and not left in large lumps, which are of small benefit, and in the way when the second digging is being done. The early clearing of the yard of manure is important, for if left long exposed most of the more valuable elements escape, and removing such manure to the land is like taking your purse to the bank with no money in it. How many think of this? The hard work of wheeling manure is performed without a thought of its contents. The only practical advantage artificial manure has over natural is that nitrogen is retained in the former. The nitric acid formed from artificial manure unites with the bases in the soil and forms nitrates of soda, magnesia, potash, &c.; therefore why not prepare or preserve our own carbonic acid and nitric acids, letting Nature manufacture our carbonates, chlorates, nitrates, sulphates, and phosphates?

Carbonic acid is abundant in all manures from stables and cowsheds, and is also deposited on the surface of the soil as carbonic dioxide, which is taken in direct by the plant; thus we may have plenty of nitrogen and carbon present in our manures. Now we want sulphur. Sulphuric acid abounds in most soils, is found in plants, and calcic sulphate (gypsum) is only sulphuric acid in combination with chalk. Phosphorus is plentiful in farm or stable manures, bones, blood, and in the ashes of plants, and more or less in all soils, therefore we have plenty of phosphoric acid to unite with the oxides of calcium (lime) to form phosphates. Calcium can be applied in the form of a good dressing of chalk or lime. If chalk is applied it also gives oxygen and carbon. If lime is applied calcium and oxygen is the result. Two more important organic elements are oxygen and hydrogen. Oxygen enters more or less into every one of the above compounds—is supplied by water and from the atmosphere, therefore we have an unlimited supply. The same with hydrogen. A source of hydrogen is water, of which it forms an important part; it is in combination with all the acids, ammonia, &c.

There are four principal elements essential to plant life—viz., potassium, calcium, magnesium, and iron, and some of these in very small quantities, as is evident by the contents of the ash left after a plant is reduced by fire. Potassium is present in all cultivated soil, and where it is believed to be scarce the best way to procure it is to burn the old refuse heaps and apply the ash. The only means of applying calcium is by dressing the ground with lime or chalk. Magnesium is present in most soils in sufficient quantities for practical purposes. It is the same with iron.

The soil, I may say, consists of three different forms of constituents—the active, the dormant, and the inactive. The active

is already at the service of the plant, the dormant is waiting to be taken up or set at liberty by the action of some of the constituents of the manure applied, or by the action of the oxygen of the air. The inactive is only made active by long cultivation, or by the application of strong manures.

By my first process, above described, endeavour is made to bring these different ingredients into active plant food. The nitrogenous matter in the manure takes up more oxygen and hydrogen and unites with the sodium and forms nitrate of soda, &c.; it is the same with sulphur, phosphorus, and others. When the soil is again dry or trenched, those elements that have not united are brought up to the air to be decomposed and to unite with the fresh ingredients put on the land the second time, and those elements that have been oxidised carried down to unite there with any bases of metals necessary. When I said that if some of the ground is left over till required so much the better, I had in my mind that if the fresh manure dug in was not washed out straw, a constant supply of carbonic acid would be given off for the plant to use at once, the soil would be full of oxygen and nitrogen, and finally the soil would be more porous for the air to penetrate. We all know what progress plants make when the soil is disturbed amongst them.

I am convinced on the point of manures that they are useless to a certain extent unless proper means are used to preserve the vegetable-producing qualities in them. No garden should be without a good covered shed or yard for cows or covered-in pigsty. It should be large enough for all the manure as it is made by the animals to be heaped, over this heap cesspool water should be poured in sufficient quantity to moisten it through, and all garden and stable refuse thrown into the rest of the sty and kept damp enough, so that it will decay, and in its turn be thrown on the heap.

I have steered as clear as possible from technical nomenclature, so that my remarks may be intelligible to those not versed in chemistry. That I could have written an article perhaps more taking to some by giving a long account of artificial manures and their effects I doubt not, but that is not my object. I want to prove that all the advantages do not lie on the side of such manures, and that as good produce can be grown without them as with them. I will do my best to improve on this in a future communication.—G. A. BISHOP, *Gardener to W. Howard, Esq., The Grove, Teddington.*

SAFFRON.

THE following additional notes on the Saffron, gleaned from various sources, may be of interest to the readers of the Journal:—

It is highly probable that it was at one time cultivated pretty widely in the southern English countries, as in addition to the town of Saffron Walden receiving its name from its connection with Saffron culture, Saffron Hill in London, formerly part of the Bishop of Ely's Holborn gardens, was also named on account of being celebrated for its growth; and Mr. Thiselton Dyer in his "Folk Lore of Plants" (p. 139) says, "In Devonshire it may be noted that this plant is used to denote anything of value, and it is related of a farmer near Exeter who, when praising a certain farm, remarked, "'Tis a very pretty little place; he'd bet so clear as Saffron." The same author cites the proverb, "You set Saffron and there came up Wolfsbane," as being used regarding actions which produce unexpected and unwished-for results. It is to be regretted that no indication is given as to the locality in which this proverb is current.

It would be interesting to know if it is still grown for trade purposes in England; and Mr. H. G. Adams in "Wonders and Beauties of the Year" says (p. 191) that it is still extensively cultivated at Saffron Walden; but Rev. H. N. Ellacombe, in his valuable work "The Plant Lore and Garden-Craft of Shakespeare," which should be in the hands of all interested in the subject of plant lore, makes no mention of this, stating, however, that "the plant is largely cultivated in many parts of Europe, but the chief centres of cultivation are in the arrondissement of Pittciviers in France and the province of Arragon in Spain, and the chief consumers are the Germans. It has also been largely cultivated in China for a great many years, and the bulbs now imported from China are found to be in many points superior to the European."

The Saffron was at one time largely in use as a medicine, and Mr. T. Thiselton Dyer says, "Our forefathers had, we are told, a great opinion of its cheering powers, and when a man was merry he is said to have 'slept on a bag of Saffron'" ("Leisure Hour," 1879, p. 174). The same author says, "It is used by the Hindoos in nervous cases; Decandolle mentions its action upon the nerves." Joseph Miller, in his "Botanicum Officinale," London, 1722, says, "Saffron is a most noble Cordial, and a Strengthener of the Heart and vital Spirits, resists Putrefaction, and is good in all kinds of malignant and contagious Distempers, in fevers, Small Pox, and Measles." It is also recommended by him for the liver, asthma, consumptions, &c. Culpepper gives practically the same information, and it is impossible to restrain a smile when he says, "It is a herb of the Sun, and under the Lion, and therefore you need not demand a reason why it strengthens the heart so exceedingly. Let not

above ten grains be given at one time, for the sun, which is the fountain of light, may dazzle the eyes and make them blind."

The following extracts from Philip Miller's "Gardeners' Dictionary," 1735, and abstracted by him from a paper presented to the Royal Society by Dr. James Douglas, may be of interest. It is here stated that the Saffron "grows at present most plentifully in Cambridgeshire, and has grown formerly in several other counties of England." The mode of cultivation and preparation, as observed during the years 1723-24-25, and -28, does not appear to differ materially from that given in the Journal on page 133. The grounds were "seldom above 3 acres, or less than one; and in choosing the principal thing they have regard to is, that they be well expos'd, the soil not poor, nor a very stiff clay, but a temperate dry mould, such as commonly lies upon chalk, and is of a hazel colour; tho' if everything else answers, the colour of the mould is pretty much neglected." The number of roots in cultivation must have been very large, as, from Dr. Douglas's calculation, 192,040 would be required to plant an acre.

The price of this dry Saffron, as will be noted from page 133, appears to have varied considerably, and Dr. Douglas, in entering into a detailed calculation of the profit of Saffron growing, gives an average price of 30s. a pound, saying "Since in very plentiful years it is sold at twenty (shillings) and is sometimes worth between three and four Pounds." He calculates an average triennial crop of 26 lbs. of Saffron per acre, and a net profit in three years of £15 13s. per acre, or about £5 4s. yearly. No allowance is made for interest on the original outlay, nor is credit taken for increase of stock.

Much further information on the Saffron will be found in Mr. Ellacombe's book previously referred to.—S. ARNOTT, *Rosedene, Kirkbean, Dumfries, N.B.*

A ROSE FREAK.

A PECULIAR Rose flower was recently sent to us by Mr. J. Jeans, Midsomer Norton, in which the carpels had nearly all been converted

FIG. 22.—A ROSE FREAK.

into buds borne on short stalks, and all appearing likely to expand. Though many peculiar formations in Rose flowers are brought to our notice, some of which have been described and illustrated, the one now represented in fig. 22 is so unusual that it is worth placing on record. The most common form of abnormal growth is that in which the axis extends after the flower is nearly mature, and after growing a few inches produces a second bud at its apex. Examples of this are frequently observed and sent for an opinion as to the cause, but it is difficult to assign what may be termed cultural causes for all the eccentricities of growth remarked in these or other plants. Such are no doubt often

induced by a check in some way, and the subsequent effort of the plant to resume its ordinary style of growth results in strange formations. Mr. Jeans says, in this case, that probably "it was caused by a check, due to the very dry weather we experienced at the end of June and in the beginning of July, and all through which it had no water. The Rose was cut from a very weakly shoot which was nearly completely covered by foliage, so that it did not get much light. Owing to this, I had no opportunity of seeing it expand, as it was not noticed till the day before I sent it you. The tree is a half-standard, about 10 feet away from the vicarage south front, where it has the full glare of the sun all day. It is very free flowering as a rule, but this year is an exception, it having only five flowers altogether. The soil is rather clayey and very poor, as it has not had any manure for three successive seasons."

ALPINE STRAWBERRIES.

THE Strawberry season may be said to be over when the Alpines are coming in plentifully, and on that account alone they have a claim to our attention. And they have other claims. First, the flavour is peculiar—a sort of acidity that is not distasteful but refreshing. Secondly, the birds do not attack them so much as other fruits. Thirdly, they can be depended on for autumn fruiting. I have had plants that began bearing in July producing fine fruit up to Christmas in a mild autumn and winter. Fourthly, a dish of Red or White Alpines set up with their own leaves is for ornament alone a good addition to the dessert.

The best plants are those raised from seed. They are more vigorous, less liable to suffer from drought, are more continuous-bearing, and more to be depended upon for autumn supply. The best plants I ever had were from seed distributed by the Royal Horticultural Society some years ago. Plants from runners are of too weak growth, the fruit after the first picking becoming small, and the runners they produce do not keep up the successional and autumn supply. With some sorts of Alpine Strawberries propagation by runners must be practised, as it is a ready mode and all cannot have seed; besides, in seed-saving the finest and best fruit must be sacrificed; but considering that plants from seed are the best, and bear the finest fruit both in summer and autumn, I strongly recommend this mode of propagation. In sowing seed we do not run the same risk of perpetuating plants which yield but small fruit, or are shy bearers, as we do when taking runners from a bed in which there are various degrees of vigour, size of fruit, and continuance of bearing. The plants propagated by runners seem to become weaker, and for anything I know may sink to an equality with the plants on a hedge bank. By taking the fruit of the most vigorous and most continuous-bearing plants, and sowing, we obtain plants fully equal to the parents. In no case have I known them inferior, for it is not species which run into all sorts of forms and give so many useless ones, though there are at times great results, but the cross-breeds. Not only do Alpine Strawberries come true from seed, but every generation shows a marked improvement in the majority of the offspring, and it is by this progressive improvement that I hope to see the Alpine yielding fruit of the size of such varieties as Black Prince. Autumn production and increased size of fruit from plants raised from seed are not peculiar to the Alpine Strawberry alone, the autumn fruiting Raspberry is influenced in the same way. The seedlings are in most instances finer than the parent, none or few producing inferior fruit.

The Alpine Strawberry succeeds best in soil overlying gravel, limestone, or in those medium-textured loams that are neither heavy nor light, and have an open subsoil from which superfluous water passes away freely. In light open soils the plants succeed with copious waterings in dry weather after they come into flower and during bearing, but in heavy wet soils they do not thrive, at least they do not with me. The plants are apt to go off in winter, and in soils of this kind I have found a raised bed advantageous. It may be formed of any kind of rough material, marking out a space about 8 feet wide, and raising, about a foot high in the centre, a mound of stones or gravel, which is covered with a foot thick of soil. This may consist of two parts loam, neither heavy nor light, enriched with one part of well-rotted manure—old cowdung is best. All round I place bricks on edge, alternately headers and stretchers, and when I have formed a row all round I have cavities which are filled with soil level with the upper sides of the bricks. I then place another row or tier of bricks as before, and so on to the top, or until the bricks from both sides meet in the centre of the mound. It may seem strange to employ bricks for such a purpose, and it may be thought that a raised mound would answer just as well. It does not, however, for the plants cannot be so well watered, the water running away too quickly by the surface, and this is prevented by the brick terraces, and the bricks keep the fruit from damping, as it is apt to do in autumn from the frequent rains. The spaces for the plants formed by the bricks are filled with soil, and one plant is planted in each. The situation should be open, and the ends of the bed ought to be north and south. In such a bed the plants continue bearing until late in autumn. Alpine Auriculas in heavy soils are quite at home in beds of this description, and Parsley thrives where, from the wetness and coldness of the soil, it is not to be had in winter when most wanted. In most soils, however, such contrivances are not required, all that is needed being a good trenching, and manure liberally worked in. A border or bank facing south is not good; the

plants grow best on an east border. On a north border they succeed very well for summer fruiting, and an open spot with the lines running north and south answers very well.

The seed should be sown in February or the beginning of March in a shallow box or pan, well drained, and filled with a compost of two parts loam, and one part leaf mould, covering lightly with fine soil. Place the pan in a gentle heat of from 70° to 75°, keep moist and close until the seedlings are up, then admit air, and keep them near the glass. When large enough to handle prick them off in shallow boxes or pans, employing a light loam enriched with one-third leaf mould. They should stand about an inch apart. Return them to the frame, and keep them close and moist, shading from bright sun for a few days until they recover, and are growing freely. Then give them plenty of air, harden them well off by the beginning of May, and plant them out where they are to fruit.

In planting three lines may be placed in a 4-foot bed at 14 inches apart, and the plants 1 foot from each other in the lines. The outside lines may be 6 inches from the edges, and 1-foot alleys being left, they will be 2 feet from the opposite outside lines of each bed. They may also be planted in lines 18 inches apart, and the plants 1 foot asunder in the lines, putting in two lines, and then allowing 2 feet between these and the next two lines, which space will serve as an alley, affording access to the plants for gathering the fruit and watering. The plants should be lifted carefully, preserving the roots as far as possible, and a good watering given, which should be repeated in dry weather. Before the dog days the intervals between the rows should every year be mulched with short manure or leaf mould. This to a great extent prevents evaporation, furnishes a good material for the runners to root in, and watering carries down a portion of the nourishing matters off the top-dressing to the Strawberry roots. The better the plants are attended to with water the better they will grow. They will not bear much the first year, though in autumn they may afford a tolerably good supply.

For autumn fruiting in the first year the seed ought to be sown at the end of January or beginning of February in heat, the seedlings pricked off when large enough, forwarded in heat, and hardened off by the end of April, when they should be planted out. When the plants commence blooming slates or tiles should be placed between the rows to prevent the dampness of the soil in autumn causing the fruit to decay. There is another advantage in the slates besides preserving the fruit—they become heated by the sun's rays, and the fruit acquire a better flavour. The runners ought to be allowed to grow; they should not be cut off as they appear, for from them we hope for fruit in autumn, as well as from the parent plants.

Instead of raising plants from seed for autumn fruiting, runners of the previous year may be planted in March or the beginning of April, and treated like the seedlings, only they are not put under glass. For summer fruiting and continuing the supply until autumn the runners should be planted out when they become well rooted, and during the year in which they are produced by the parent plants. The trusses of bloom ought to be pinched off as they show on those planted in spring, to furnish late autumn fruit until August, as by allowing them to fruit before they become established we keep them weak, unable to give more than a moiety of autumn fruit.

Having the plants established from seed or runners, in March I cut away all the runners not rooted, point the soil between the lines and around the plants, and give a top-dressing of decayed manure fully an inch thick. When the plants are coming into bloom give a similar top-dressing, and afterwards water copiously in dry weather. There is no necessity for putting down slates in summer or in the second year, for the crop will come in from July to the end of August. When the gatherings are becoming smaller—the plants are very sluggish in August, as most Alpines are from the drought—I take away any runners where too crowded, but not many, and top-dress again, putting the top-dressing neatly round the plants and runners, and give a good soaking of water then and every third day as long as the weather continues dry. I place some slates between the rows by the end of September, destroying some runners which would have fruited no doubt but for the slates; but any loss from this cause is compensated for by the fruit being prevented from decaying. The result the second year is plenty of fruit in July and August, the supply slackening a little at the end of the month; and from September to Christmas if the weather is mild I have fruit—not a dish every day but very often, and might have a dish every day if a sufficient number of plants were grown.

In the third year trim and top-dress in March. Leave a good many runners at that time between the rows, and water well after they come into bloom. They will bear an immense number of fruit—small but the finest of all for preserving, as they keep their form so well, and they are particularly desirable for glasses on the table. It is hard to tell whether the red or white are the more beautiful. After they have borne all the fruit they will in the third year, break up the bed, and plant the ground with anything but Strawberries. To keep up a supply we must sow or plant every year, or not more seldom than every alternate year.

If blight appears it is a sign that the watering is insufficient or runs off by the surface without wetting the soil, as water often does on slopes. In this case holes should be made with an iron bar or rod, and the water given gently. By the exercise of a little patience the soil may thus be made thoroughly moist. The blight or mildew disappears when the soil becomes moist, and a good wetting overhead on the evenings of hot days will wash it off the fruit, and keep the latter from

becoming deformed and from not swelling; indeed, if the mildew be left to itself the blooms turn blind. Plenty of air, water, and a broiling sun are the delight of the Strawberry.

It may not be known that seedlings grown in 6-inch pots placed in a frame early in November, always afforded air, but protected from frost, if removed to a light airy house in December and set on a shelf near the glass, will fruit in winter. Their handsome fruit and pretty foliage render them fine objects for table decoration, the red variety contrasting well with the white. The plants should be grown in partial shade until the end of August, have all blooms picked off, and then be potted in 6-inch pots, layering the first runners just within the rim as a fringe all round. Set the pots in the full sun and water well. The plants may be had in bearing throughout the autumn, and at any time you like by picking off the flowers six weeks before you want them. Remove all runners but those wanted for the fringe.—G. A.

GRAND MOGUL, H.P.

THE note of my friend, "Duckwing," in a recent number of the Journal (p. 108) as to Grand Mogul has remained unanswered. While setting up at the Crystal Palace this year someone came along addressing the world in general and red rosettes in particular, with a similar query which sounded a good deal like a riddle, "What is the difference between Grand Mogul and Jean Souper?" I hope he found a satisfactory answer, but I confess that I was unequal to supplying anything beyond the somewhat trite one, "Give it up, ask me an easier." As to budding, my humble advice would be not to waste valuable time, honest labour, or healthy stocks on either of them.

THE GROWTH OF THE BUD.

There are one or two questions connected with the growth of the Rose bud which might perhaps be elucidated in some measure by discussion, for I, at all events, do not understand them for certain. At the end of the shoot, with the health and strength of which we have taken such pains, comes at last the bud, surrounded by its satellites. These duly removed we want the bud to grow and become big. Sometimes it will, remaining dormant a long time and swelling gradually. Sometimes it will not, but bursts into a premature loose and flabby bloom, though the shoot be of the strongest. This is most clearly seen, I think, in the case of Tea Roses, and especially with Comtesse de Nadaillac and Princess of Wales, which are of somewhat similar habit. With these two varieties I can never tell which shoot is good to produce a strong bud, the longest and strongest sometimes opening prematurely, and small shoots gradually thickening while the bud is dormant and growing. The critical time is when the calyx turns back and a smoothly folded hard cone of petal appears. Sometimes this cone does not alter in appearance for a long time, however hot the weather may be, but simply swells, then it will be a great and probably a good Rose. Sometimes it begins to unfold almost immediately, then it will be comparatively small and probably hollow. Experience shows that neither the strength of the shoot nor the character of the weather is responsible for this different behaviour, and the question is, Why, in such cases, does the one bud swell before opening, and the other fail to do so?

As a possible help to the solution of this conundrum, let us have another. Why are second blooms, even on fresh strong shoots thrown up from the base, so generally inferior to the first? It is a common maxim in the vegetable world that those growths are the best which are made without hindrance. With most plants it is a gardener's great object to grow them along without any check. But the first blooms of our Roses have met with many checks; they have generally been chilled and stopped again and again by cold winds during almost all their growing time, and sometimes have to put up with actual frosts, not to mention all manner of insects which can bite and destroy. The second bloom, on the contrary, which comes on a strong flush shoot, which starts from the base at midsummer or July, has no such check whatever. Constant warm nights, no caterpillars, a thoroughly warmed and tilled soil, no wonder its growth is thicker and taller than that of the shoots which have borne the battle and the breeze of most specimens of our merry month of May. How comes it, then, that the bloom, though fair on some H.P.s, is generally not so good as on the earlier started and weaker-looking shoots? Anna Ollivier is a good example; we know its habit of throwing up much stronger and taller shoots directly the first bloom is over, and that these shoots, as a rule, do not produce blooms so good as the shorter and earlier ones.

Now, then, for a theory, which, however, is not put forward as anything new or original. Are the blooms of the secondary and stronger shoots flabby and poor because the unchecked and persistent flow of sap forces the buds to expand before they have time to grow? If so, here may be also an answer to our first question. The weak shoots of Comtesse de Nadaillac, whose growing dormant buds produce

such fine blooms, may do so because they get just enough sap to make the buds grow, and not enough to force them out too soon, and the strong shoots may get too much and thus be opened prematurely. And again, secondary later shoots produce weaker blooms, because they have not passed through the checking, hardening, delaying days and nights of an English spring. But if all this be true, are we doing wrong in our continued efforts to increase the flow of sap by strong stocks, healthy plants, liquid manure, stirred soil, and every means in our power? I think not, because, as a general rule, and universally perhaps with H.P.s, the strongest shoots of those that start in spring will have the strongest blooms; and the same rule would generally hold good with Teas, except occasionally, as I have said, with Comtesse de Nadaillac, Princess of Wales, and perhaps some others. "Exceptions prove the rule," they say; my second bloom of Teas has this year been better, barring the rain, than the first; but then the past July, when the secondary buds were dormant, has been cooler and less forcing than May or June.

The idea arose in connection with a rosarian of repute, who spoke of bending down even such long and strong shoots as Marie Van Houtte to get the buds under caps to protect them from the rain. "But would not that check the sap?" was my question. "All the better," he replied, "for then the bud would grow," and that answer was the cause of these lucubrations. My Marie Van Houtte buds do grow. I find the strongest shoot does have the biggest blooms, and I can hardly think they would be better by being bent down, though I have not tried it. But the habit of Comtesse de Nadaillac and Princess of Wales has still to be accounted for if the theory given above is rejected (and I find a stiff, straight, perpendicular shoot of these varieties seldom has a perfect bloom). And if it be true what are we to do? There are plenty of ways of checking the sap. Not thinning the side shoots or laterals too severely would do this I suppose. Often when the growth is rapid every bud will push and grow all up the stem, even before the terminal flower bud has thrown back the calyx. Are we wise to check all these side channels, and cram the sap up to the end of the shoot as quick as we can? Then, too, there are ligatures of sorts. What of something in the way of a tourniquet, which would act as a tap, so that we could turn the sap on or off as we liked? But this is somewhat wild. I cannot think, till I am told by someone who knows, that a check of sap is necessary or desirable for anything but secondary shoots (which are perhaps not worth it), and for the mysterious growth of bud occasionally seen in the too good dwarf Teas before mentioned. The questions, therefore, which I wish to put to rosarians are these. Is the comparative poorness of the blooms on strong secondary shoots starting from the base in summer due to a want of hindrance to the too free flow of sap? And is it the same cause or some modification of it which makes the buds of Comtesse de Nadaillac and some others so uncertain in the first stage as to whether they will grow and become big, or flower prematurely?—W. R. RAILLEM.

IRON FOR ROSES.

MR. TONKS says iron is essential in the soil for the production of good Roses. Will he, or any other correspondent, inform me whether oxide of iron (which is very cheap), would be beneficial to the soil and consequent blooms if applied as a surface dressing, or dug in in the autumn or spring, and oblige one whose ambition to excel the whole convocation of rosarians, lay and clerical, has hitherto been—DISAPPOINTED.

SCORCHING IN VINES.

HEAT, as derived from the sun's rays striking suddenly on the glass roof of a horticultural building, causes the rise of the internal temperature in a proportional rapid or slow rate as they proceed in a direct or oblique inclination from their source, which should prove that injury to Vines would be more prevalent during the height of summer, though as a matter of fact it is more so during the spring months; this, of course, being accounted for through the young and tender foliage not being so well adapted to withstand the strain it is sometimes called upon to bear. When the rise of the temperature of the house is rapid, a corresponding rapid evaporation of moisture from all damp surfaces is caused, and this occurring in a structure in which no ventilation is afforded the heavily charged but rarefied air ascends until it comes into contact with the glass roof, which does not absorb heat so readily as the atmosphere, and is therefore considerably colder than the ascending air, the result being that the moisture becomes condensed in the form of dew on the glass; this for a time acts as a screen to the foliage, and protects it from the fierce rays of the sun. In the course of a short time, as the glass absorbs heat and approaches the same temperature as the atmosphere of the house no condensation takes place, and the temperature rapidly rises, and the air escapes between the laps of the glass, taking with it the moisture contained in the house, then such thin textured portions of the plants as contain liquid are forced to yield up their store, with the result that we have before observed—viz., the rupture and subsequent death of those portions.

From this view of the cause of Vines being scorched we might almost think that ventilation is calculated to do more harm than good, inasmuch as it favours the escape of the heated air, consequently promotes evaporation of the moisture contained in the house, and therefore predisposes scorching. To a certain extent we may perhaps be right, but we must not overlook the fact that in ventilation afforded at

the proper time, and ventilation given after the house has become highly heated, there is a vast divergency of power that may cause good or bad effect.

Granted that ventilation in some form or other is indispensable to a healthy condition of the plants raised in glass structures, it should follow that it is the faulty manipulation of the ventilators that causes the mischief rather than the non-observance of the principles that cause the adoption of such proceedings, especially if the views of such as advocate a close system of cultivation is taken into account, for if, as they affirm, scorching is an evil almost unknown to such as thoroughly understand the practice of non-ventilation, the question turns upon the importance of a complete knowledge of the reason why we ventilate and why we do not. Some cultivators assume that the chief motive should be with the object of admitting fresh air, and on every possible occasion when they deem it favourable proceed to ventilate their fruit or plant houses with a zeal that should assure astounding results if that alone were the chief factor of success. I consider it waste of energy to strive to attain such a fine adjustment of temperatures. If once those in charge of glass houses can be induced to comprehend the principle on which ventilation is practised, there remains but little necessity to endeavour to instil the minute details. If a young beginner can once grasp the ideas that an abrupt change in plant life, whether it be in respect to air, earth, or water, little remains except occasional unavoidable accidents and such like contingencies to insure the successful and satisfactory issue to such a practitioner's efforts.

Now the question presented is, Why do the phenomena of scorching occur in properly ventilated houses and seldom or never in those where no ventilation is afforded? This no doubt is somewhat puzzling to such as endeavour to impress on the uninitiated the disastrous effects in neglecting to ventilate their houses at the prescribed proper moment. I have never been fortunate enough to obtain the precise views of such a one on the state he would expect the occupants of a house to present after a spell of non-ventilation. When shading is practised either by blinds or by means of lime or colour washes a twofold end is gained—the fierce direct rays of the sun are intercepted and broken up, which reduces their heating power, and at the same time obviates the necessity of opening the ventilators to prevent the temperature being raised too high; this again favours the maintenance of a more steady and genial atmosphere, and in such atmosphere where humidity is preserved to be plainly perceptible to the senses, no scorching can occur if the diagnosis is correct that I have given previously. So that it appears that scorching is not a question of ventilating, but of the adequate supply of moisture in the air within the structure, and I might also add to the roots of plants as well. Some severe cases of leaf-scorching that have come under my notice have been plainly attributable to this cause, and when such is the origin of the mischief shading and close ventilation, with free disposition of moisture atmospherically will only temporarily allay the evil, as it cannot fail to occur on the first occasion that the plant is subjected to anything approaching an evaporating influence.

Another phase of the injury that owes its origin to defective glass is sometimes met, but not frequently, as the cause is generally promptly removed when it is observed that plants placed in a certain position in the house are invariably injured if allowed to remain there for any length of time. This is undoubtedly caused by the globular unevenness of the glass focussing the rays of the sun, so that they blaze with concentrated energy upon certain parts of the plants, and literally burn them. Much the same effect is produced—generally during the early part of the season—upon the common Laurel, Holly, and other smooth surfaced leaves. Small circular holes being produced in this case, resulting from moisture being deposited on them by a slight shower that is not sufficient to moisten the whole leaf, this causes the deposit to assume a tiny globular form, which acting as a lens when the sun again shines cause the death of that portion of the leaf. It is, I imagine, from this fact that the popular idea has gained ground that watering plants over the foliage during bright sunshine will cause disastrous results.—M. COOMBE.

THE ROYAL HORTICULTURAL SOCIETY'S JOURNAL.

THE second part of vol. xi. of the above Society's Journal, edited by D. Morris, Esq., M.A., and the Rev. W. Wilks, M.A., Treasurer and Secretary respectively, has just been issued from the offices, 117, Victoria Street, S.W., and though it has been long expected the important character of its contents will compensate in a great measure for the unavoidable delay that has occurred. The part contains 138 pages, and includes the papers read with the consequent discussion at the meetings of the Society from March 12th to June 11th of the present year; but does not comprise any reference to the meetings of the Fruit, Floral, and Scientific Committees during the same period, this probably being reserved for the next issue. It is published at the price of 5s. to non-Fellows, which in these days of cheap literature might be regarded as exorbitant by any purchaser who had not previously seen the work. A brief glance at the leading papers will show, however, that they are interesting alike to amateur and professional horticulturists.

SAXIFRAGES.

The first paper is one by Mr. J. G. Baker, entitled "Notes on Saxifrages," in which he deals with their geographical distribution and

the principal characters of the genus. Referring to garden Saxifrages he says :—

"Out of the 180 species we have just about half in cultivation. There are a great many names in the garden catalogues of which botany knows nothing. As this paper will be printed in the proceedings of our Society I thought the best thing I could do would be to give a classified catalogue of the cultivated species, with their names and native countries. I have followed Engler's classification and adopted his numbers, so that the blanks will show roughly where the non-cultivated species fall. The great bulk of the cultivated species come under six out of the sixteen groups. Three out of these six have the cotyledons tipped and the leaves more or less bordered with glands, and the three others are without them. Of the non-foveolate groups *Dactyloides* includes twenty-one species. These are marked by their mossy habit, copious trailing leafy shoots, palmately divided leaves, and few corymbose flowers, with petals usually large and white. The best known species of this group are *hypnoides*, *ceratophylla*, and *caespitosa*, with its numerous varieties. Two fine large flowered types of recent introduction are *Camposii* and *Maweania*. The second non-foveolate group is *Robertsonia*, which only includes three species, *umbrosa*, *Geum*, and *cuneifolia*. The third is *Bergenia* (called *Megasea* by Haworth), which is confined to the Western Himalayas and mountains of Siberia, and is very clearly separated from all the other groups by its red unspotted petals, thick rootstocks, and large undivided leaves of firm texture." Of the foveolate groups the best known is *Euaizoonia* (or crustaceous Saxifrages), in which the densely rosulate leaves are margined with numerous chalk-secreting pores, and the numerous flowers form ample erect panicles. The most widely spread species of this group is *S. Aizoon*. For purposes of cultivation, *Cotyledon*, *florulenta*, *longifolia*, and *lingulata* are the finest. Several of the species have a restricted range amongst the mountains of Southern Europe. I should like to know how far these need carbonate of lime for their successful cultivation. In *Kabschia*, under which eighteen cultivated species fall (of which we may take *S. Burseriana* as a type), the leaf-glands are much fewer and less conspicuous, the flowers fewer, and the leafy shoots last for some years, and are thickly beset down below the fresh leaves with the relics of the old ones. In *Porphyron*, which includes *oppositifolia* and three other high alpine species, the leaves are opposite and decussate, and the red or purple flowers solitary on short leafy peduncles. In the small Chinese and Japanese group *Diptera* there are long creeping stolons, and the spotted petals are very unequal in size. The Californian *S. peltata* has large peltate leaves like that of a *Rhubarb* or *Gunnera*. I do not think there are many species not yet introduced that are worth much from a garden point of view. Out of the thirty-five Himalayan species, which are mostly endemic, twenty-six have not yet been introduced."

The paper is concluded with a list of species (166) and hybrids with their parentage (14).

Mr. George Paul followed with a paper on the cultivation of Saxifrages, in which some useful practical hints were condensed into small compass. Noting the Encrusted species he remarked :—

"One of the most interesting sections of this family is that known as the Encrusted Saxifrages. In this the leaves are of a tufted habit, jewelled, so to speak, with silvery dots (of carbonate of lime), so that even when not in flower they are beautiful objects. I have found these thrive best under culture, either in pots placed in a sunny open place, or planted on rocky buttresses standing out from the face of the rock-work. These buttresses may be formed of rocky *débris* of limestone or granite (the plants appear to thrive equally well on either), but it is necessary that the roots should be able to penetrate to a good depth. Others may be planted in situations fully exposed to the sun on the sides or upper surfaces amongst broken stones; whilst the beautiful *S. longifolia* of the Pyrenees prefers to be planted vertically between stones, and for choice looking towards the west. Other sorts in this section, such as *S. Aizoon* and varieties, *S. lanfoscana*, *S. pyramidalis*, will thrive anywhere on rocky walls; whilst a special few, such as the beautiful *S. Burseriana* and *S. caesia*, always impatient of moisture, need the highest and best drained situations that can be given them. Once established in such situations, plants of this section form dense tufts of silvery foliage often from 6 inches to 1 foot in diameter. They bloom abundantly during the months of April, May, and June, the flowers being mostly white, but sometimes, as in *S. Macnabiana*, with carmine or red spots on the petals. Success in the culture of these plants depends on the use of gritty or sandy soil, on good drainage, an open sunny aspect, and plenty of water in summer whilst the plants are in a growing state."

Cultural notes on the principal groups and species of *Saxifraga* are also contributed by Mr. G. Reuthe of Tottenham.

HYACINTHS.

Three papers are devoted to Hyacinths. One by Heer A. E. Baarnart, Haarlem entitled, "Historical Notes on Dutch Hyacinths" reviews the earlier history of those plants briefly but thoroughly. A second paper by Heer J. H. Kersten, Haarlem, discusses the cultivation of Hyacinths in Holland, in which we are informed that 570 English acres are occupied with these plants in Holland, and at least 5000 men are engaged in the trade. It is also said that :—

"The flowers, having no value in Holland, are often sent to the English market. This, however, is considered so injurious to the trade

in bulbs, that measures are being taken to prevent it. The fact that at last the secret has been found to extract a perfume from Hyacinth flowers may add not a little to remove this grievance."

"The Hyacinth, from an English Point of View" is the title of Mr. J. Douglas's paper, in which are incorporated the chief facts derived from the author's long experience as a cultivator and exhibitor. The writer observes:—

"I have cultivated the Hyacinth successfully as an exhibition plant in pots for more than a quarter of a century, and may therefore claim the right to be a teacher of those who are but commencing their culture. The first point to attend to is the purchase of the bulbs; and if the best results are expected, full-grown bulbs must be purchased in the best varieties. Those intended to flower early should be planted in their pots about the middle of September, or even earlier. Those that will flower in March, a month later. They should be planted in a rich compound of good loam two parts, one part decayed cow manure, one part leaf mould, and one of river sand. This mixture should be laid up in a heap about the beginning of August, in order that the ingredients may be well incorporated before the material is used. I use the ordinary form of pot, 5 and 6 inches diameter inside measure. See that the pots are clean, and that clean potsberds are placed over the holes for drainage; some rough turf should be placed over the drainage to prevent the finer particles of soil from mixing with it, and thus choking the outlet of water. It is well known that a Hyacinth will grow and flower well in water only; but when it is planted in garden mould too much water, or a stoppage of the outlet for the superfluous water, will destroy the roots and seriously cripple the growth of the plant."

DAFFODILS.

An exhaustive paper on "The Narcissus," by Mr. F. W. Burbidge, M.A., occupies twenty-three pages of the journal, and gives an interesting review of the leading characters of the genus, structure, colour, distribution, species, hybrids, names, seedlings, and culture, showing special sections devoted to their consideration. Double varieties are also discussed, and a select list of the best varieties in all the groups is furnished.

"Seedling Daffodils" receive the attention of the Rev. G. H. Engleheart, M.A., and many interesting suggestions are given to cultivators. In regard to double varieties, it is said:—

"Enough attention has not been paid to the raising of double seedlings. Double Daffodils seed more often than is supposed. A very double Daffodil often has the stigma perfect and visible among the tightly packed petals if the flower is well examined. It is because there is seldom a large pod that the seed is unnoticed. A few seeds may not uncommonly be found in what looks merely like the rather swollen end of the pedicel. I have seedlings of the common 'double Telamonius' now in flower, and several other gardeners can say the same. Hybrid or crossed doubles are not impossibilities. In 1885 I noticed the stigma protruding from the tightly-double trunk of a few flowers of double cernuus. I marked them, and obtained nineteen seeds, eleven of which grew. Out of curiosity I dusted the stigma of one or two with pollen from a yellow Ajax—I believe it was spurious—which was growing near at hand. This spring one of the eleven seedlings is flowering, and the cross was evidently effectual, for the flower—so far as I could judge, of it in its half-opened state before I left home—is drooping, like cernuus, but so yellow as to be almost precisely like the common double yellow. The ten unflowered seedlings seem to vary in leaf and habit, and I may have more oddities to report next year. It may be of service to hybridisers to know that the pollen of double Narcissi commonly gives doubleness to single flowers fertilised with it. In my garden I have some clumps of the common double yellow on a walled south border, which therefore bloom early. In a batch of seedlings from 'Tenby,' sown in 1884, I have one quite double flower, differing in no visible feature from the common double yellow or Telamonius plenus. I understand that my friend Mr. Wolley Dod has had precisely the same experience, and I do not doubt that in both gardens insects conveyed pollen from the double flower to the single. These seedlings have been grown in ranks and watched every year, and no mistake has been made. Our common wild Pseudo-N., when fertilised by pollen of the common double yellow, yields single yellow seedlings, and also doubles of a small intermediate character. Much then, I think, might be done to give us greater variety in double Narcissi."

Mr. Alfred Tait, F.L.S., of Oporto, contributes some "Observations on Portuguese Narcissi," in which several of the best species and natural hybrids found in northern Portugal are described.

THE AURICULA.

The discourses of the Rev. F. D. Horner on Auriculas are always worth hearing or perusal, and the paper in this issue of the Journal is replete with instructive notes.

"In the days of the older raisers there were weak flowers produced and accepted, perhaps for variety's sake, if they were anything like an Auricula, perhaps because to equal the best was an impious expectation. But a sterner rule is laid down for us, and I am not sorry for it. A new Auricula is at once taken for judgment before the best of the older flowers, and if it is not worthy it stands lower than the old second-rates. Some redoubtable champion variety is flung at its diminished head, and that floral missile is at present the grand grey-edge George

Lightbody. Even this flower often shows more faults than one, all the more vexatious because it can do better. But at its best it is far too true an Auricula for us to wish to see it driven out of the field. Our aim is rather to surround it with compeers which it will be a great honour to defeat. Towards that—and not in one class only but in all—I feel a quiet assurance that we are progressing. Another point upon which I would lay all stress is purity. In crosses I would keep class to class to intensify class distinctions, to avoid beaded edges in the green-edged, undecided edges in the greys, and lack of density in the whites. So may the selfs also have their rule of colour to colour. Enterprising exceptions here should be made carefully, for some mixtures only result in dull and common shades of puce, and unattractive tints of plum, to say nothing of fancy sports that scarcely have a name in colour."

The concluding paper is "Orchid Culture, Past and Present," by Mr. H. J. Veiteb, comprising an extremely interesting review of Orchid history, particularly in regard to the practical improvement in culture and the extension of knowledge generally respecting Orchids.

NATIONAL CHRYSANTHEMUM SOCIETY.—A Conference of cultivators and others interested in the Chrysanthemum will be held on September 11th in conjunction with the National Chrysanthemum Society's Exhibition of early flowering Chrysanthemums, with Dahlias and Gladioli, at the Royal Aquarium. The programme prepared by the Sub-Committee appointed to carry out the arrangements includes a paper by Mr. W. Piercy of Forest Hill on "Early Flowering Chrysanthemums," and a paper by Mr. J. Doughty of Angley Park on the "Treatment of Plants (Grown for the Production of Exhibition Blooms) a Short Time Previous to the Shows." The chair will be taken at 4 P.M.

— It is with feelings of regret that I record the death of MR. G. D. VALLANCE OF TRESKO ABBEY, ISLES OF SCILLY. He had of late suffered from an affection of the heart, although he was not obliged to give up his duties till quite recently, when provision was made for him to reside at Yetton. He died at Exeter on the 17th inst., on his way over from Scilly in company with one of his sons. He was well known during the last few years in connection with the fine gardens at Scilly. His gardening career was commenced at Stackpole Court, Pembrokeshire, at an early age, being apprenticed there. After leaving here he served in other places, and in due course took charge of the gardens at Farleigh Castle, near Bath. There he remained seventeen years, gaining the respect of all with whom he came in contact, and more especially by the young men of the village, whom he taught in the evening school gratuitously for many years. After this he went to Pen Hall, near Sherborne, where he remained thirteen years; from there to Tresco, where he discharged his various duties for fourteen years. He was a good all-round gardener, and had many friends, gained by his genial manner.—J. C. F.

— IMPROVED VARIETIES OF VEGETABLES AND FRUITS.—I feel sure it will be interesting to many Fellows of the Royal Horticultural Society to be informed whether the supposition under which I labour, that seeds of improved varieties of vegetables and flowers raised in the Society's gardens, are distributed amongst the Fellows, as in accordance with the practice of the Society.—F. R. H. S.

— GARDEN IVIES.—Many thanks, in which I am sure many of your Ivy-loving readers will join me, for Mr. Shirley Hibberd's clear and concise list of all known varieties. The "Ivy green" is a great favourite here, and we have many varieties from many places, from abbey, and castle, and parsonage, and priest's house, and cottage garden. The delightful vagaries of the Ivy always remind me of the healthy school boy at play. It (and he?) does many things, generally simple and beautiful tricks of Nature, and with the intuition of native genius, and is scarcely ever twice alike.—TEMPORA MUTANTUR.

— GARDENERS' IMPROVEMENT SOCIETIES.—It is becoming the custom, and a very good custom it is, for the members of Gardeners' Improvement Societies to pay annual visits to nurseries and gardens of note that are conveniently accessible. Not only is a well earned day of pleasure thus enjoyed, but information is gathered and hints stored by

the visitors which may be of considerable service in the conduct of the gardens with which they are severally entrusted. Large contingents from the Birmingham and Bolton-le-Moors Societies recently visited Chester, and appear to have been delighted with the ancient city, with the extensive nurseries of Messrs. Dicksons, Limited, and with the large well appointed and admirably managed garden of the Duke of Westminster at Eaton Hall. The visiting members of the Societies desire to record their appreciation of the cordial reception they received at both those establishments.

— MR. W. B. HARTLAND has sent us blooms of his GOLDEN QUILLED SUNFLOWER SOLEIL D'OR, apparently a form of *Helianthus multiflorus plenus*, but without the guard or ray florets of that variety as usually grown in gardens. The flowers did not arrive in good condition, but were bright in colour, and when fresh the blooms would probably resemble somewhat Madame Domage Chrysanthemum. It is no doubt an effective late summer and autumn border plant.

— TUFTED PANSIES.—Will any of your readers tell me who gave the name of Tufted Pansies to our Violas, and why "Tufted," and how they are made into Pansies? To me it seems a stupid name, used only to catch purchasers and sell them as well as the plants. I know a little about Violas and Pansies as you know, but I am in the dark here, and until I have some very logical reason for the change I shall ignore the name of "Tufted Pansies" as a delusion and a snare.—D. S.

— PTERIS TREMULA SMITHIANA.—In your report of the R.H.S.'s meeting, August 13th, in your issue of to-day, we observe you say, "A first-class certificate was awarded to Messrs. J. Laing and Sons for *Pteris tremula Smithiana*." We shall be much obliged if you will correct this error in your next issue, as the plant in question is our own seedling, and was exhibited by us and the certificate awarded to us.—RICHARD SMITH & Co., Worcester. [With great pleasure we make this correction of a clerical error which occurred in copying the awards.]

— THE CEDARS, CASTLE BROMWICH.—What memories of the past are revived by the mention of The Cedars, made famous amongst florists by the late Charles Perry, for a long time the home of the Verbena and one of our best florists. The Cedars is now inhabited by a gentleman who to a very great extent keeps up the traditions of the place by growing Roses, Dahlias, and in every way maintaining the gardens in first rate order. I looked in the churchyard to see the grave of our dear old friend, and I was surprised to find that on no stone or in any way was there an indication that it was Charles Perry's last resting place. But for the fact that I followed him there in company with many other sorrowing florist friends some years ago and knew the spot I should have had to make inquiries to enable me to find it.—D. S.

— REMARKABLE GROWTH OF THE BRITISH TEA TRADE.—It is generally understood that no commercial interests with which our countrymen are connected has grown more rapidly than the production of Tea in various parts of the Queen's Eastern dominions. To exhibit this wonderful advance to the eye, and in geographical and statistical detail, is the design of a "Map showing the great Tea-growing Districts of our Eastern Empire," which has been prepared mainly for the use of the trade by Messrs. R. M. Holborn & Sons of Mincing Lane. In this map the widely separated districts of Assam, Cachar, Chittagong, Dooras, Nagpore, and Ceylon, with the scattered gardens of Kangra, Dehra Deon, Kumaon, Neilgherries, and Travancore are brought into one view. An inserted table shows the extraordinary fact that while as lately as 1873 the imports of Tea growers in Ceylon amounted to no more than 23 lbs., by 1885 they had reached 3,750,000 lbs. Last year they rose to 20,500,000 lbs., and it is estimated that by the close of the present year they will have reached the astonishing total of 40,000,000 lbs. In the production of Indian Tea the advance is no less remarkable, as shown by the statistics of the last twenty years. In 1868 the imports were in round numbers 8,000,000 lbs., in 1878 they were 36,000,000 lbs., and in 1888 they were 92,000,000 lbs. The estimate for 1889 is 105,000,000 lbs. This vast increase of British production is at the expense of the Chinese Tea grower, whose part in ministering to English consumption is a vanishing quantity.

— FRUIT PROSPECTS AT MAINDIFF COURT.—It is of much interest to all concerned in fruit growing to note the effects of the sunless season of 1883 in the fruit garden. Many attribute the failure of the fruit crops this season to the unripened state of the wood, while here we have no reason to grumble, as fruit of various kinds are a good crop. Apples are good, notably Lord Suffield, Worcester Pearmain, and

Cox's Pippin. Apricots are a good even crop. Pears are a heavy crop, in many instances over the average—viz., Jargonelle, Marie Louise, Easter Beurré, Emile d'Heyst, and several others too numerous to mention. Plums are an excellent crop; the trees are trained against a protected wall with an eastern aspect, it was necessary to give them several thinnings, and yet they have too much fruit—Washington, Jefferson, Diamond, Green and Golden Gage are the most notable, and the trees are free of blight. Peaches and Nectarines are abundant on a protected wall with a western aspect; Alexander was ripe on this wall on the 22nd of July. Strawberries were very plentiful; some stools of the well-known variety Vicomtesse Héricart de Thury yielded 4 lbs. of good fruit. Raspberries were good. Damsons are carrying a heavy crop, and are quite clean after the recent rains. Gooseberries are very plentiful, the fruit large and of fine flavour. Black, Red, and White Currants were plentiful; the former were heavily thinned by the birds while they were green. I have never known birds to attack green fruit until this year. Morello Cherries are a pretty good crop, while the May Dukes were light. Figs are well represented by Brown Turkey; and here I may add that great credit is due to the gardener, Mr. G. Harding, for the way he carries out all branches of his calling. It would not be easy to excel the fruit, flower, and kitchen gardens at the present time.—W. H. N.

SEASONABLE NOTES ON GREENHOUSE PLANTS.

CYCLAMENS.

YOUNG growing plants for autumn and early winter are now growing freely in a cool brick pit. The plants are standing on a bed of coal ashes. The plants are shaded from bright sun, as the Cyclamen cannot endure direct sunshine or an arid atmosphere. Careful ventilation is also necessary. Watering must be carefully attended to, and care must be taken not to pour the water in the centre of the corms. The plants should also be dewed over with a fine syringe, using soft water on fine afternoons about 4 P.M.

BOUVARDIAS.

These are now growing freely, and if required for autumn flowering pinching will not now be necessary. The pit or frame, whichever the plants are growing in, may also be freely ventilated, but shade from direct sun. A little Clay's fertiliser sprinkled on the surface once a week will help the plants considerably. We syringe them every afternoon about 4 P.M. Young plants that are late should be encouraged to make growth by keeping them in an intermediate temperature. This is managed by not giving too much ventilation and by closing early in the afternoon.

CARNATION SOUVENIR DE LA MALMAISON.

This Carnation has deservedly become a favourite, and is in great demand in London. The plants have now finished flowering, and layering must be attended to. If allowed to grow on the plants become tall and unsightly, and young plants give the finest blooms. We have just layered our plants. An old hotbed is used; over this is spread a layer of fine sandy soil to the depth of 6 inches, when the plants are turned out of the pots and the balls placed low down. The shoots are then layered, and should receive a good watering, and every afternoon a dewing with a fine-rose pot. As soon as the layers take root these must be removed from the parent plants and potted into 60-sized pots. Pot firmly and keep them in a cool frame until established. Early in November the plants are best placed on a shelf in a cool greenhouse. If allowed to remain in the frame during the winter the foliage becomes spotted. These are not so hardy as the border Carnations.

CINERARIAS.

During the summer months young Cinerarias are best in a cool frame behind a north wall, but away from overhanging trees or high buildings, as this would cause the plants to become drawn. The plants must be potted as soon as the roots show through the drainage in the bottom of the pots. If allowed to become root-bound the plants are ruined. Three parts loam, one peat leaf soil, and one part well pulverised horse manure is a good compost. Pot firmly, and keep the frame rather close and shaded, when the plants will soon become established. On fine and dewy evenings the lights may be drawn off the plants altogether, and remain off during the night; but the lights must be replaced in the morning whilst the dew is on the foliage. This causes the plants to become hardy, and lays a good foundation for successful keeping during the winter months. The foliage must be kept free from insects. A little tobacco powder sprinkled on the under sides of the leaves will keep them in check.

SHOW PELARGONIUMS.

The growth is now ripening, and water must be withheld for a time. Lay the plants on their sides. In the course of a week our plants will be cut down, and still be kept laid down and dry for about ten days, when the pots are best stood in a well ventilated frame, and syringed twice a day. This will cause young shoots to form, when the plants must be turned out of the pots, and have the roots well reduced. The longest roots must be cut in, and the plants placed in as small pots as convenient. Pot very firmly and return to the frame. The following compost is well adapted to the requirements of the Pelar-

gonium :—Three parts fibrous loam of a rather heavy nature, and one part each of leaf soil and well pulverised horse manure, with a little sand. After potting very little water will be necessary, but they should be well syringed once a day. Sufficient water must be given to keep the soil fairly moist, but not wet. If green fly appear fumigate at once.

ZONAL PELARGONIUMS.

Zonal Pelargoniums, either for autumn or winter flowering, should now be well established in their pots, and be stood in the full sun on a bed of ashes. If for winter the flower buds must be kept pinched off until the end of September; but they are much more useful when in bloom from the end of September and through October, so as to come in before the Chrysanthemums, or along with the earliest. A group of Madame Desgrange Chrysanthemum and Zonals have a pretty effect.—A. YOUNG.

AN ESSEX UTOPIA.

A SHORT distance from Ilford on the Great Eastern Railway from Liverpool Street or Fenchurch Street Stations is situated the Barking-side Village Home for Girls, one of several establishments of a similar character under the management of Dr. Barnardo, who, though

portion of two quadrangular spaces, all the front windows facing the garden. The work was commenced in the middle of March, 1888—somewhat late, as the completion of planting was required the same spring. This was accomplished, however, some sixty men being employed, and over 5000 trees and shrubs were planted, few being lost, although the season was so advanced. Spacious lawns were nearly all formed by sowing seed, and they now present a satisfactory appearance; indeed, the same year, by careful mowing a fairly close and fresh sward was produced. The provision of good paths was an important matter in a place of this kind with so many children continually passing to and from the cottages; so after careful consideration it was decided to adopt tar paving, of which about 8000 yards were laid, and the surface having been subsequently dressed with crushed marble, the appearance is as bright as could be desired, and the durability of such paths when well made proves that an additional primary expenditure is really economical. This has been amply demonstrated in the London parks in the east and south-east portions of the metropolis, which are much frequented during the summer months. The main roads have been made of flint and Hertford gravel.

FIG. 23.—VILLAGE HOMES AT BARKINGSIDE.

entirely dependant upon voluntary contributions, has developed an extensive and admirable charitable scheme of inestimable benefit alike to the inmates and the public generally. At Barking-side there are fifty cottages giving accommodation to 800 girls, each home being under the immediate superintendence of a matron, and every arrangement is made with the view of rendering each establishment as much like a home as possible, avoiding the barrack-like method of the ordinary asylums in all respects. The children are the waifs and strays of the great metropolis, and it is impossible to say how many have been rescued from a life of crime and misery by the training and education they have received in such homes as these. Not content, however, with providing mere house comforts, Dr. Barnardo has endeavoured to render the surroundings as pleasing as possible, and with this object he entrusted Mr. Wm. Holmes of the Frampton Park Nurseries, Hackney, with the task of laying out the grounds attached to the cottages, who has succeeded in adding very materially to the attractions of the establishment by the skilful execution of a design well suited to the situation.

There are about fifteen acres of land, the cottages being placed on the outer margin, so that the pleasure ground occupies the central

Three large fountains have been introduced with good effect, well stocked with fish and aquatic plants, the margins being adorned with tasteful and informal rockeries, occupied with suitable trailing and flowering plants. Two handsome wire roseries are also noticeable, and when covered with the roses, which are making good progress, they will be very attractive. The floral display is mostly confined, and very appropriately, to mixed borders of plants. The shrubberies are well furnished, and a gay effect is insured in spring or early summer by the six large beds of carefully selected named Rhododendrons. Every detail has been well considered, and Mr. Holmes, who has had considerable experience in work of this kind, has good reason to be satisfied with the results of his labour. In the illustration (fig. 23), prepared from a photograph by Mr. W. Mountain, 211, Clapham Road, a view is given of a portion of the ground, which will give some idea of the general style.

POTATOES AT CHISWICK.

THE several varieties of Potatoes on trial this year in the Royal Horticultural Society's Gardens were examined on Tuesday last by members of the Fruit and Vegetable Committee, and the following

varieties were selected as productive and good in appearance. The heavy rains of the night previous to lifting affected the whole of them prejudicially, and though several were cooked, it was considered advisable to submit them to a further trial for satisfactorily determining their qualities.

Vegetarian (Dean).—Oval, white, free cropper, fine sample.

The Canon (Dean).—White, round, medium size, splendid crop.

Edgecote Early.—Kidney, medium size, good shape and good crop.

The Governor (Dean).—Kidney, white, large, even, and good crop.

Crown Jewel (Fletcher).—White, round, evenly shaped, medium-sized tubers, great crop.

Bedfont Purple (Dean).—Fine uniform tubers, and a good crop.

Irishman (Kane).—White, round tubers, large with somewhat deep eyes; very heavy crop.

Debutante (Ross).—Bright crimson, round, uniform, good crop, rather small tubers.

Early Victor (Oakshott & Millard).—Large, white, flattish oval, even sized tubers, good crop.

Satisfaction (Oakshott & Millard).—White, round, heavy crop of good sized tubers.

Tacoma (Bliss).—Pink, large, roundish, a heavy crop.

Ellington's Prolific.—White, round, medium size, even; very heavy crop.

THE LONDON PARKS.

SOUTHWARK PARK.

PERHAPS few of those who make a yearly pilgrimage to the London Parks ever visit that situated near the Thames in the south-east district, and known as Southwark Park. It is quite out of the ordinary route, and necessitates a special journey to a densely populated and not too salubrious a neighbourhood, yet to those who are interested in town gardening, and who wish to see how much can be effected by good management under unfavourable circumstances, a visit would not be altogether unprofitable. The fact is that it affords an agreeable surprise to all who are unacquainted with its attractions and resources, as few could expect to find anything of horticultural importance in Rotherhithe or the adjoining districts. Still the Park mentioned would compare favourably with any similar place of public resort in the eastern portion of the metropolis. It is in such a neighbourhood as this that parks, public gardens, and open spaces are most needed and most valuable. It is also satisfactory to note that they are greatly appreciated judging by the large number of people who assemble in them on Sundays and at general holiday times. Securing spaces in such situations, laying out, planting, and maintaining them is a wise expenditure of public money, and cannot bring anything but good results to a portion of the community that experience few of the pleasures of life.

Southwark Park is an extensive tract of land, originally flat and uninteresting enough no doubt, but by the aid of the landscape gardener's art it has been improved out of recognition, and now presents considerable diversity of aspect. It is easily reached by steamboat from London Bridge to Cherry Garden Pier, which is within a few minutes' walk of the two entrances in Union Road. The Deptford Road station on the London Bridge line is also a short distance from the Park, and tramcars pass the Jamaica Level entrance frequently. From the last named gate a hard straight road extends some 200 yards to the refreshment pavilion, and upon turf slopes on each side are numerous carpet and flower beds, bright and effective as they should be in such a position. To the right is the subtropical garden and lake; beyond this a large space reserved for cricket and other sports. On the left are tree-shaded walks and avenues, dense shrubberies, and an open space devoted to band stand and seats for visitors. Nearly the whole of the walks are of asphalt or some similar composition, which are found cleaner, drier, and more durable than gravel, where they are so much frequented as in these parks. Of course some objection can be raised against such paths on account of their appearance, but where a white or light coloured finely broken surfacing material is employed this objection does not hold good. An important matter in forming these parks is to have them well furnished with trees and shrubs that will endure the smoke and fumes of London and make fairly good progress. This necessarily restricts the selection considerably, and renders it difficult to introduce much variety in foliage or contour effects. Amongst trees Poplars, Planes, and Limes are most relied upon, and in shrubs Privet, Aucubas, Lilacs, and common Laurels predominate. Most of these seem to be making progress, and some have attained good size, becoming vigorous well developed specimens.

The principal flower and carpet beds are seen near the Jamaica Level entrance already mentioned, and some of these may be noted. Near the entrance are two large beds upon rather steep slopes on opposite sides of the road. One has a groundwork of Golden Feather, with large panels of *Mentha Pulegium gibraltarica*, edged with *Alternantheras*; smaller panels of *A. versicolor*, and a centre of *A. aurea* edged with *Echeverias*. This is flanked by two crescent-shaped beds, containing scarlet Zonal Pelargoniums, *Calceolarias*, *Lobelias*, and *Antennaria* as a margin. Upon the other side of the road the beds are not quite so bright, *Ageratums*, Pelargoniums, and *Iresine Lindenii* being chiefly employed. One characteristic of several beds in these slopes is that a background or edging of a taller and different plant from that in the front is frequently employed. Sometimes this has a good appearance, but in a few instances it is rather incongruous, and rather spoils the symmetry of the bed.

A crescent-shaped bed raised at the back is one of the most pleasing. A series of panels in a well designed scroll have centres of *Mesembryanthemum cordifolium variegatum*, edged with a neat band of *Lobelia pumila*, *Alternanthera aurea* and *A. magnifica*, with the outer edge of *Violas* and *Echeverias*. The back edge is formed of variegated Pelargoniums with end blocks of *Antennaria tormentosa* and "London Pride." A smaller space is occupied with several beds, the whole surrounded by sloping banks of Ivy, Pelargoniums furnishing the chief colour in the centre. Near this is another crescent-shaped bed with somewhat angular panels in a scroll, Golden Feather forming the chief groundwork, filled in with *Lobelias* and *Alternanthera magnifica*. A star-shaped bed of moderate size is planted with blue and white *Violas*, filled in with Stonecrop, edged with *Antennarias*. *Lobelias* are employed freely in several large beds with good effect, one variety, a deep rich blue with white eye, being conspicuous amongst the others. A peculiar conical bed is seen in one portion of the slope, it is 3 or 4 feet high, covered with *Mentha Pulegium gibraltarica*, and having designs in *Echeverias* and *Alternantheras* on the sides. This is original and arrests attention, but it is rather more strange than beautiful, and is scarcely a style to be recommended; it must be also very difficult to plant and keep in order.

The lake has been tastefully designed; the islands are well planted with trees, and several picturesque peeps are obtained that could not be expected in a park so unfavourably situated as this. The slopes around are of grass kept neatly mown, but the margin of the water itself consists of cable-like tiles or bricks, which impart a rather formal appearance, though something of the kind is probably necessary to keep up the edge. Some of the banks here are raised to a good elevation, and assist in improving the aspect of the surroundings materially. The park generally affords ample proof that it is well attended, and the Superintendent, Mr. G. Bush, evidently understands what is required in the locality.

DISA GRANDIFLORA.

THIS plant often fails to grow satisfactorily through being placed in too warm, too close, and too dry an atmosphere. The best examples that have come under my notice were grown at the shady end, close to the door of a small greenhouse. The position was shaded from the sun, constantly moist, and the door open from the end of May until September. The cool treatment that this *Disa* enjoys has led growers to remove squares of glass directly opposite the plants, and substitute perforated zinc. They certainly enjoy during genial weather a constant supply of air; but during winter, when they are making their growth, they do not appear to appreciate cold air constantly striking upon them. After flowering the plants enjoy a period of rest, and if the position in which they have been grown is such that they can be kept cool and moist without recourse to constant watering all the better. We have found a cool shady frame, where the pans can be plunged in cocoa-nut fibre refuse, a capital place for them for a month or five weeks after flowering. During this time no more water should be given than is really necessary, but take care that they do not become dry, or the roots are very liable to perish. When the pots are plunged in a cool shady place occasional sprinkling with the syringe will be ample to keep the soil moist and the roots in good condition. We prefer at all times to water them by the aid of the syringe. The syringe further assists in keeping them free from aphides and red spider.

MAXILLARIA GRANDIFLORA.

This Orchid is said to flourish well with the coolest treatment, but its progress is very slow; in fact, there is no comparison between the growth of a plant in a cool house and one in a warm structure. It grows strongly and increases rapidly in the Cattleya house, or will flourish admirably in an ordinary stove. Under such treatment it will make and mature at least two growths in the year. It blooms under cool treatment in the autumn, but when grown in heat its flowering time is changed. We have flowers at various times during the year. At one time after growth had been made we removed it for a time to a cool house to rest, and then started it again into growth. It is just possible we had more flowers by this means than by the method of culture we are now pursuing. For some time we have given the plant the same treatment as the Cattleyas enjoy, and anyone anxious to develop a large plant quickly we advise to follow this course. It does well in a pot and roots abundantly in good peat, a little charcoal, with a thin layer of moss on the surface, which in the course of a season

becomes one mass of roots. The roots cling tenaciously to pieces of broken pots, which may be incorporated with the peat instead of charcoal.

ONCIDIUM ORNITHORHYNCHUM.

There are two varieties of this charming *Oncidium*, one having larger and darker flowers than the other. Both forms are worth growing, but that with the darker flowers is decidedly the better. Where the plant is grown in the *Cattleya* house the flower spikes are either visible or will be soon. If grown in a pot or pan slugs must be looked after, for they appear particularly fond of the small tender spikes. It certainly does well in a pot or pan, but displays its arching spikes of small fragrant flowers to much greater advantage when grown in a basket. Frequently the foliage presents a light green, almost a sickly yellow appearance, but this is not natural. When well grown with sweet suitable compost about its roots the foliage will be luxuriant and moderately dark in appearance. Those in pots with us are certainly the most healthy in appearance, the pots being more than half filled with crocks, the plants moderately elevated above the rim and potted firmly in fibrous peat and good sized lumps of charcoal, a little moss only being placed on the surface. The difference in the condition of the plants is, we believe, mainly due to the watering. In baskets they cannot be watered with the same care as when grown in pots. They are liable to have too much by dipping and a free use of the syringe.—ORCHID GROWER.

REVIEW OF BOOK.

The Useful Plants of Australia (including Tasmania). By J. H. MAIDEN, F.L.S., Curator of the Museum. London: Triebner and Co., Ludgate Hill; Sydney: Turner & Henderson, 1889.

THE work is issued by the order of the Committee of Management of the Technological Museum of New South Wales, at Sydney, an institution which contains over 25,000 specimens, and is "intended to occupy a similar position, and fulfil the same purpose" as the leading London Museums. The author, as Curator of such a collection, was well qualified to undertake so important and comprehensive a subject as the one treated in the book under notice, and he has performed his task in a thoroughly satisfactory manner, for it will constitute a valuable work of reference for colonists and others concerned with the commerce of the country. In 696 pages an astonishing number of plants and products are described or mentioned, and the system adopted is as follows:—There are eleven sections devoted to human foods, forage plants, drugs, gums and resins, oils, perfumes, dyes, tans, timbers, fibres, and miscellaneous, by far the greater portion of the book (nearly 300 pages) being occupied with a consideration of the timbers, a subject which, by its importance, had ample claims to this prominence. The other subjects necessarily require much less space, but are exhaustively treated. The names of the plants yielding the various products are given, with their principal synonyms, authorities, natural orders, and references to works containing descriptions; then follow the native names, and particulars of the special products. The names are arranged alphabetically in each section, which is more convenient for reference; but a very full index of vernacular and botanical names also increases the value of the work greatly.

In the section devoted to peds it is curious to note how few plants of any general importance are enumerated, but the references to two are worth reproduction, as showing the character of the book.

PORTULACA OLERACEA.

"The seeds of this plant are largely used for food by the natives of the interior. One would suppose that so small a seed would scarcely repay the labour of collecting, but the natives obtain large quantities by pulling up the plants, throwing them in heaps, which after a few days they turn over, and an abundant supply of seed is found to have fallen out, and can be easily gathered up; the food prepared from this seed must be highly nutritious, for during the season that it lasts the natives get in splendid condition on it. The seeds are jet black, and look like very fine gunpowder. The natives grind them in the usual mill—i.e., a large flat stone or bed stone on which the seed is put, and a smaller one to be held in the hand for grinding, and of the flour they make a coarse paste. 'We had almost daily occasion to praise the value of the Purslane, which not only occurred in every part of the country explored, but also principally in the neighbourhood of rivers, often in the greatest abundance. We found it in sandy and grassy localities so agreeably acidulous as to use it for food without any preparation, and I have reason to attribute the continuance of our health partly to the constant use of this valuable plant. The absence of other antiscorbutic herbs in the north, and the facility with which it may be gathered, entitle it to particular notice.'—*Baron Mueller's Botanical Report of the North Australian Expedition (quoted by Dr. Woolls).*"

TYPHA ANGUSTIFOLIA.

"The young shoots are edible, and resemble Asparagus. The root is excellent. The pollen is used as food by the natives of Scinde, India, being made into cakes.—(Dymock). It is used for the same purpose in New Zealand.

"In a paper by Gerard Krefft (*Proc. Philos. Soc. N.S.W.* 1862-5)

'On the Lower Murray Aborigines,' the following description is given by him of the method of preparing these roots for food. He gives the species name as *T. Shuttleworthii*, but this has been merged in the present species:—"At a certain period, I believe January and February, the women enter the swamps, take up the roots of these Reeds, and carry them in large bundles to their camp. The roots thus collected are 12 to 18 inches in length, and they contain, besides a small quantity of saccharine matter, a considerable quantity of fibre. The roots are roasted in a hollow made in the ground, and either consumed hot or taken as a sort of provision upon hunting expeditions; they are at best a miserable apology for flour, and I almost believe it was on account of the tough fibre thus obtained that these roots were made an article of food."

"This plant is also termed the 'Asparagus of the Cossacks,' the Cossacks of the Don being very fond of it. They prepare it like Asparagus, and cut it, like the latter, when the young shoots are pushing; the tender blanched part is boiled in water seasoned with salt, and served up in the same way as Asparagus. The various culinary preparations to which Asparagus is subjected are suitable for *Typha latifolia*. In collecting it they peel off the cuticle, and select the blanched tender part, usually about 18 inches in length, near the root, and this constitutes a dish, cool, agreeable, and wholesome."

Amongst the forage plants the Grasses naturally predominate, forty-three pages being occupied in their enumeration.

HORTICULTURAL SHOWS.

TAUNTON DEANE.

THE hopes of the managers of this excellent Show must have been at a very low ebb on the day previous. A driving rain, high wind, and cloudy sky seemed bad precursors of a flower show. However, their hopes rose again when Thursday ushered in a fair though threatening day. This, however, passed off, and it may be judged to what extent the Show is patronised by the fact that 3000 paid for admission in the afternoon, and 8000 in the evening, to see what is always an adjunct of the Taunton Show, a grand exhibition of fireworks by Mr. Pain. It was the twenty-second Show of the Society. My own acquaintance with it dates back some fourteen years, during which I have, of course, seen many changes in its staff and amongst its exhibitors, but I see no signs of decay, and taking its last exhibition as a whole, I can safely say that I have never seen a better, and rarely so good a one. One feature was for the first time absent, the beautiful bank of *Gladioli* set up by Mr. Kelway, and this was to me a great blank, for it is a pleasure to see such a stand as he always exhibits. Another exhibitor, too, was not seen there—Mr. Dobree of Wellington—who in years past used to exhibit *Gladioli* so well; but most other exhibits were well represented, and some I have never seen in finer condition.

The Show is held in four tents, two of very large dimensions, in the first of which are placed the plants and cut flowers exhibited in the nurserymen's and open classes; in the second the plants and flowers contributed by amateurs; and in the third the fruit and vegetables, the latter being always a strong feature in the Taunton Show. Besides the plants and flowers entered for competition, a beautiful bank of plants and flowers was shown by Mr. Veitch of Exeter, in which were many novelties.

It may give some idea of the extent of the Exhibition when I say that the stands for cut flowers were many of them placed on the ground for the Judges to examine, as the stages were completely filled. On entering the large tent the grand flowering and foliage plants of Mr. Cypher of Cheltenham, Mr. Cleave, and Mrs. Pearce at once attracted attention. Then along one side was a blaze of bloom supplied by *Pelargoniums*, which are always so well done at Taunton; *Begonias*, which were far superior to anything I have seen here before; while on the other side were arranged the cut flowers, consisting of *Roses*, *Gladioli*, *Asters*, *Verbenas*, *Hollyhocks*, *Carnations*, &c., while the remaining portion of the central stage was filled up by *Fuchsias*, *Lilies*, *Ferns*, and other plants.

One could almost name beforehand what plants are likely to be found amongst the large collections, but I do not think that I have ever seen Mr. Cypher exhibiting in better form than on this occasion. His plants, which obtained the first prize, were *Clerodendron Balfourianum*, *Allamanda grandiflora*, *Bougainvillea glabra*, *Erica Irbyana*, *Erica tricolor ornata*, *Stephanotis floribunda*, *Statice profusa*, *Erica Austriana*, *Erica Barnesii*, *Ixora Pilgrimi*, and *Allamanda nobilis*. In Mr. Cleave's second prize lot were good plants of *Stephanotis floribunda*, *Cleodendron Balfourianum* and *Allamanda nobilis*. The groups of foliaged plants contributed by the same exhibitors were very fine, each holding the same place as in the stove and greenhouse plants. There was a nice collection of six stove and greenhouse plants contributed by Mr. Cypher and Mrs. Pearce. I did not notice anything particularly new in the *Pelargoniums*, in fact the appearance of the plants indicated that they were not youngsters, so that novelties were not likely to be seen amongst them.

I have rarely seen *Roses* in August so well exhibited as in this division of the Show. The stands of Mr. Mallock of Oxford containing some remarkably fine blooms for the season of the year. Amongst them were Captain Christy, Duchess of Bedford, Madame Gabriel Luizet, Grand Mogul, Annie Wood, E. Y. Teas, Comtesse de Nadaillac, Harrison Weir, Francisca Kruger, Xavier Olibo, Souvenir d'un Ami, Charles Darwin, Hon. Edith Gifford, Senateur Vaisse, Charles Lefebvre,

A. K. Williams, Devienne Lamy, Amazon, Le Havre, Niphetos, Alfred Colomb, Comtesse Riza du Parc, Maurice Bernardin, Duc de Montpensier, Madame Berard, and Général Jacqueminot. If this should meet the eye of this exhibitor, might I suggest to him that it would be a great boon, not merely to those who report the Show, but also to the general public if his labels were a little more distinct? They were written very faintly in a very fine hand, and it was exceedingly difficult to decipher them, and made it a difficult matter to take the names. If he does not care to use the printed ones, clear written ones would be a great boon. Messrs. Mack & Son made a long journey from Catterick, Yorkshire, and were a good second in forty-eights, third in twenty-four trebles. Amongst their flowers was a beautiful triplet of their fine variety. Sir Rowland Hill, its rich dark colour marking it out as a very distinct variety. The Gladioli were very disappointing; few of any real excellence were exhibited, and those that were set up were nameless seedlings, of which probably the exhibitor will know nothing next year. Nor were the stands effectively set up, the spikes were too much of a length, so that the back rows were completely hidden by those in front. Asters were very fine in both sections, the flowers being clean and fresh. There are some good blooms of Dahlias exhibited by that active exhibitor, Mr. T. Hobbs of Lower Easton, Bristol, and by the local grower, Mr. Watson; but Dahlias have fallen off here, the number of varieties not being so large as formerly, and the fine stands of Messrs. Keynes, Williams & Co. being much missed.

There is no place that I know where Achimenes are so well exhibited as at Taunton, and it was impossible to imagine finer plants than those exhibited by J. Marshall, Esq., whose able gardener, Mr. Lucas, has grown them to such perfection. The Roses in this division were not equal to those in the open classes, but a very beautiful box of Teas was shown by Mr. H. Fowler of Claremont, showing what a fallacy it is to suppose that this very beautiful class will not flourish in the neighbourhood of Taunton. Mr. Fowler had also a good stand of Carnations.

Table decorations form a prominent feature of the Taunton Show, and it was pleasant to see that the lessons taught by Miss Cypher in former years had not been thrown away, for the latter, which obtained first and second prizes, were excellent and in thoroughly good taste—the light and elegant character of the centrepieces was all that could be desired. The hand bouquets also were very good, and the decorative tent generally was a credit to the exhibitors.

It was a matter of great regret that one of the very earnest Secretaries was indisposed, but his colleague worked "double tides," and the Committee was indefatigable in its efforts to make things go smoothly for all, and thus ensure the success of the Show, which is unsurpassed at this season of the year by any in the kingdom.—D. Deal.

Fruit.—A grand lot of fruit was shown, this department being quite equal to the rest of a generally superior exhibition. The first prize for a collection of ten dishes of fruit was awarded to Mr. W. Iggulden, who had better Black Hamburg Grapes than were shown by him at Weston-super-Mare and Exeter, but the rest of the exhibit did not differ materially from what has previously been noted. Mr. Nicholson, gardener to the Earl Fortescue, South Molton, was placed second, but he certainly had some luck in the matter, as the third prize collection, staged by Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, was the most generally satisfactory exhibit. Mr. Nicholas had a very fine Smooth Cayenne Pine Apple, superior Brown Turkey Figs, and an exceptionally fine dish of Cherries. The last-named might be described as a very large form of Black Tartarian, fully equalling that good variety in point of quality, and surpassing the largest Morellos in size. It is a seedling of great value. Several collections of four dishes of fruit were staged, Mr. Daffurn, Weston-super-Mare, being well first with good Madresfield Court Grapes, Grosse Mignonne Peaches, Elruge Nectarines, and Hero of Lockinge Melon. Mr. Crossman, gardener to J. Brutton, Esq., Yeovil, was second, and Mr. G. J. Barnes, gardener to T. C. Daniels, Esq., third. The last named was a good first for Muscat of Alexandria Grapes, and Mr. J. Lloyd second; and for any other white variety Mr. J. Webber, gardener to G. F. Luttrell, Esq., was first, and Mr. C. C. Cooper, gardener to C. L. Collard, Esq., second, both having good Buckland Sweetwater. The first prize for Black Hamburg Grapes was awarded to Mr. Iggulden, who had fine bunches and berries a little wanting in colour. Mr. J. Loosemore, gardener to C. Cooper, Esq., was a creditable second. In the any other black class Mr. W. Daffurn was first, and Mr. J. Lloyd second, both having fairly well finished Madresfield Court. Mr. Bryant was first, and Mr. Crossman second, for a Melon, a considerable number of fruit being shown. Mr. Nicholas was first, and Mr. Bull second, with a Pine Apple, both having very fine fruit of Smooth Cayenne. The first prize for Peaches was awarded to Mr. Iggulden for a highly coloured dish of Barrington, Mr. Daffurn being second with a fine dish of Grosse Mignonne. For Nectarines these positions were reversed, Mr. Daffurn being first for highly coloured Elruge. Apricots, Plums, Cherries, and other hardy fruit were all extensively and well shown, and immense quantities of vegetables were staged in various classes by professional gardeners, amateurs, and cottagers.

WESTBOURNE AND DISTRICT.—AUGUST 7TH AND 8TH.

THE above Society held its fifth annual Exhibition of plants, fruits, flowers, and vegetables on the above dates in a pasture field at Branksome Deane, by the kind permission of Lord Wimborne. The place in which the Show was held is a very suitable site for a fruit and flower show, being surrounded by trees, and within half an hour's walk of the fashionable seaside town of Bournemouth. Every praise is due to

the Committee and energetic Hon. Secretary, Mr. S. Minty, and his assistant, Mr. K. Pottle, for the business-like manner in which they all performed their duties. All that was required to insure success was fine weather, which, unfortunately, the Society did not have on the opening day, as there were heavy showers at short intervals throughout the day. The most successful exhibitors in the open classes were Mr. William Earp, gardener to J. S. Sellon, Esq., Horne Towers, Bournemouth; Mr. G. Roberts, gardener to Mrs. M. Smalley; Mr. C. Phillips, gardener to T. J. Hawkinson, Esq.; and Mr. Taylor, gardener to R. J. Ellershaw, Esq., all of Bournemouth or district.

Plants.—Three collections of stove and greenhouse plants, distinct varieties, not less than four flowering, and in pots not exceeding 11 inches, were staged. Mr. C. Phillips was first with creditable plants of *Acalypha tricolor*, beautifully coloured; *Chamærops humilis*, *Allamanda Hendersoni*, *Cocos Weddelliana*, *Dracena australis*, *Pandanus Veitchi*, and *Plumbago capensis*. Mr. W. Earp was a very close second, his best plants being *Clerodendron Balfourianum*, *Croton irregularis*, and *Pandanus Veitchi*. Mr. Earp had the best specimen stove or greenhouse plant. Mr. Phillips was first for nine varieties of exotic Ferns, showing among others good plants of *Alsophila australis*, *Davallia canariensis*, *D. bullata*, *Adiantum formosum*, and *A. euneatum*. Mr. Earp was a very close second, his best plant being *Polypodium aureum*. Three good collections of Ferns were shown in this class. The same exhibitor was first for six Fuchsias, showing plants about 5 feet high, well furnished with healthy foliage and profusely flowered shoots, with one exception. He was also first for six healthy well-flowered trained Zonal Pelargoniums. With three plants of Tuberous-rooted Begonias Mr. E. G. Roberts was first for small but well-flowered plants. In the class for six pans or pots of Achimenes Mr. C. Phillips was once more to the front, showing fairly good plants. He also had the best six plants of flat trained Coleus, well coloured. Mr. Bush, gardener to Lord Wimborne, Branksome Deane, Bournemouth, had the best group of plants arranged for effect on a space not exceeding 60 feet. The plants used were suitable for the purpose, and were tastefully arranged.

Cut Flowers.—These were not shown very extensively, but they were on the whole very good, especially the double Dahlias, with which Mr. Elsworth easily secured first prize; the same exhibitor taking chief honours, out of three stands shown, for twelve Roses. Miss E. A. Watkins had the best hand bouquet, and Mr. Blanford, gardener to W. R. Sharp, Esq., the second best, for tasteful arrangements. Asters and Geraniums in varieties were also shown in fairly good form.

Fruit.—The competition in the fruit classes was not very keen, but the exhibits were of good quality. Mr. G. Roberts had the best two bunches of Black Hamburg Grapes, the bunches being of medium size, shapely, fine in berry, and beautifully coloured. Mr. William Earp was a close second. In the corresponding class for white Grapes Mr. Earp was first with fairly good examples of Chasselas Musqué; he was also easily first for a collection of six sorts of fruit, with Black Hamburg Grapes, George IV. Peach, Brown Turkey Figs, Paradise Melon, Jargonelle Pears, and Cherries. Mr. Earp was also first for six Peaches with good clean fruits of Grosse Mignonne, and dessert Apples with fairly good specimens of Early Julien. Mr. Greenaway, gardener to T. B. Scott, Esq., had the best flavoured Melon in a good sized Hero of Lockinge. Mr. Roberts was first for culinary Apples with fine specimens of Lord Suffield.

Vegetables.—Three good collections of six sorts were staged. Mr. Earp led the way, showing Gladiator Peas, Moore's Cream Marrows, Chiswick Favourite Potato, Veitch's Perfection Tomato (very good), and Mammoth Runner Beans. Mr. Bush was second, his Tomatoes and Onions very good, and Mr. C. Phillips was third. Mr. T. K. Ingram, Parkstone Nursery, was a good first with a brace of large, handsome, fresh-looking Cucumbers of what appeared to be Duke of Edinburgh. Messrs. Phillips & Sons, Westbourne, were second with good fruits. Mr. Ingram was again to the front with an admirable dish of Veitch's Perfection Tomato. Mr. Earp was a creditable second.

Messrs. Sutton & Sons' Special Prizes.—Mr. Earp was first for six fruits of Reading Perfection Tomato, showing large, handsome, even, and highly coloured fruits; Mr. Bush was second; and Mr. Andrews, gardener to M. Coates, Esq., Bath Hotel, Bournemouth, was third. Messrs. James Carter & Co. gave three prizes for collections of six sorts of vegetables. Mr. C. Phillips was awarded first prize, his best dishes being Tomatoes, Runner Beans, and Onions.

Miscellaneous Exhibits.—Messrs. Watts & Sons, The Palace Nurseries, Bournemouth, arranged, not for competition, a very pretty and bright group of plants, semicircular in form at one end of the centre of the large tent; Mr. J. K. Ingram having arranged to very good effect a similar group at the other end of the same tent. Both these groups were very much, and deservedly so, admired by visitors. Mr. Haskins, Branksome Nursery, and Messrs. Phillips & Sons, also arranged two smaller groups on either side the entrance of this tent. In the classes set apart for single-handed gardeners Mr. Taylor of Branksome Park was the most successful, taking first out of four good groups with well-grown clean plants; Mr. Stedwell being second, first for specimen stove or greenhouse plants, and first for six stove and greenhouse plants, Mr. Bush being second.

NATIONAL CARNATION AND PICOTEE SOCIETY (NORTHERN SECTION).

THIS Society held its annual meeting on Saturday, the 10th inst., at the Botanical Gardens, Manchester. Though there were more exhibitors than last year, the Show, as a whole, was not to be compared with

the Oxford Show. One difference specially noticeable between these Exhibitions is, that whereas at Oxford the quality is even throughout, here—after the first, second, or third prize stands—there is a great falling off. There was great dissatisfaction among exhibitors at the judging in the single bloom classes, especially in that for scarlet flakes, where the first prize bloom was not nearly so good as the bloom of Robert Cannell, which was placed third; or one of Matador, which did not receive a prize at all. Mr. T. Lord of Todmorden, Mr. J. Whitham, Hebden Bridge; and the Birmingham exhibitors (Messrs. Sydenham, Brown, and Jones), as at Oxford, took the greater portion of the prizes. The following are the leading prizewinners:—

Class A, twelve Carnations, dissimilar.—First, Mr. T. Lord, Todmorden, with George Melville, Admiral Curzon, Thalia, Wm. Bacon, Edward Rowan, Jessica, J. D. Hextall, John Ball, Wm. Skirving, George, Shirley Hibberd, and Reginald Power. Second, Mr. R. Sydenham, Birmingham, with Alisemond, Sarah Payne, George Melville, Thalia, Joseph Lakin, James Douglas, Master Fred, J. T. Hedderley, Rob Roy, Matador, Arthur Medhurst, and Mrs. Andrew. Third, S. Barlow, Esq., Stakehill, Castleton, Manchester. Fourth, Mr. F. Law, Rochdale. Fifth, Mr. J. Beswick, Middleton, Manchester.

Class B, twelve Picotees, dissimilar.—First, Mr. T. Lord, with Mrs. Sharp, Zerlina, Mrs. Payne, Alliance, Morna, Minnie, Thos. William, Lady Louisa, Royal Visit, Nellie, Favourite, and Brunette. Second, Mr. Robert Sydenham with Seedling, Hilda, Annot Lyle, Mrs. Chancellor, Edith D'Ombra, Favourite, Dr. Epps, Mrs. Payne, Mrs. Bower, Frauline, Baroness Burdett Coutts, and Mrs. Sharp. Third, S. Barlow, Esq.; fourth, Mr. J. Beswick; fifth, Mr. F. Law. **Class C, twelve Carnations, nine dissimilar.**—First, Mr. T. Helliwell, Todmorden, with Admiral Curzon, Cristagalli, Robert Lord, Master Fred, Squire Llewelyn, Jas. Douglas, Ivenhoe, Wm. Skirving, Sybil, and George. Second, Mr. J. Whitham, Hebden Bridge; third, Mr. J. Edwards, Blackley, Manchester; fourth, Mr. A. R. Brown, Birmingham. **Class D, twelve Picotees, nine dissimilar.**—First, Mr. J. Whitham, with Morna, Thos. William, Royal Visit, Zerlina, Nellie, Mrs. Niven, Mrs. Sharp, Brunette, Lady Louisa, Ann Lord, and Mrs. Chancellor. Second, Mr. A. R. Brown, with Constance Heron, Mrs. Payne, Imogen, Erhel, Favourite, Muriel, J. B. Bryant, Campanini, Dr. Epps, and Edith D'Ombra; third, Mr. J. Edwards; fourth, Mr. T. Helliwell; fifth, Mr. J. Whittaker, Middleton, Manchester.

Class E, six Carnations, dissimilar.—First, Mr. J. Maddocks, Loft-house Hall, with George Melville, Wm. Skirving, Cristagalli, Robert Houlgrave, John Hines, and Lord Milton. Second, Mr. G. Thornley, Middleton. Third, G. Whittaker. Fourth, Mr. S. Lord, Rochdale. Fifth, Mr. W. Bacon, Derby. Sixth, Mr. J. Bleakley, Middleton.

Class F, six Picotees, dissimilar.—First, Mr. A. W. Jones, Birmingham, with Mrs. Sharp, Mrs. Chancellor, Thos. William, Nellie, Mrs. Sharp, and Muriel. Second, Mr. J. Maddocks. Third, Mr. G. Thornley. Fourth, Mr. G. Bleakley. Fifth, Mr. W. Bacon. Extra prizes, twelve Selfs, Fancies or yellow grounds.—First, Mr. A. R. Brown, with grand blooms of Almira, Dorothy, Annie Douglas, Colonial Beauty, Agnes Chambers, The Governor, Germania, Dodwell's S 191, Terra Cotta, Dodwell's S 192, and Mary Morris. Second, Mr. T. Lord. Six exhibitors.

Carnations.—Class G, single blooms, Scarlet Bizarres.—First, second, third, and fourth, Mr. T. Lord, with Admiral Curzon and Robert Lord. Fifth, Mr. J. Yates, Disley. **Crimson Bizarres.**—First, Mr. G. Thornley, with Master Fred. Second, third, and fifth, Mr. T. Lord, with a seedling and Richard Bealey. Fourth, Mr. R. Sydenham. **Pink and Purple Bizarres.**—First, second, and third, Mr. T. Lord, with Sarah Payne, Wm. Skirving, and John Harrison. Fourth, Mr. J. Beswick. Fifth, Mr. R. Sydenham. **Scarlet Flakes.**—First, second, third, fourth, and fifth, with John Ball, Sportsman, Robert Cannell, and Henry Cannell. **Purple Flakes.**—First, second, and third, Mr. Lord, with Gordon Lewis and Earl of Wilton. Fourth, Mr. J. Beswick. Fifth, Mr. T. Helliwell. **Rose Flakes.**—First, Mr. R. Sydenham, with Thalia. Second, Mr. Helliwell, with Cristagalli. Third, fourth, and fifth, Mr. T. Lord, with Sybil.

Picotees.—**Heavy Red.**—First, third, and fourth Mr. Lord with Dr. Epps; second Mr. Whitham with Morna; fifth Mr. Helliwell. **Light Reds.**—First Mr. J. Whitham, second Mr. Lord, third Mr. Sydenham, fourth and fifth Mr. J. Bleakley, all with Thos. William. **Heavy Purples.**—First Mr. J. Whitham with Mrs. Chancellor; second and fourth Mr. J. Beswick with Muriel and Zerlina; third Mr. Lord with Mrs. Chancellor; fifth Mr. Yates with Muriel. **Light Purples.**—First and fourth Mr. T. Lord with Mary; second Mr. A. W. Jones with Baroness Burdett Coutts; third Mr. Helliwell with Ann Lord; fifth Mr. J. Bleakley. **Heavy Roses.**—First Mr. Lord with Mrs. Payne; second Mr. Brown with Mrs. Payne; third Mr. Helliwell with Lady Louisa, fourth Mr. Sydenham, fifth Mr. Beswick. **Light Roses.**—First and second Mr. A. W. Jones with Favourite; third Mr. G. Yates, fourth Mr. Lord, fifth Mr. Sydenham with the same variety. **Premier Carnation,** Admiral Curzon, exhibited by Mr. Helliwell. **Premier Picotee,** Thos. Payne, exhibited by Mr. T. Lord.—A NORTHERN FLORIST.

WESTON-SUPER-MARE.—AUGUST 13TH.

THIS was in every respect a most successful meeting. The competition in the plant classes was especially good, cut flowers, fruit, and vegetables also being well represented. Mr. F. T. Perrett is the courteous and energetic Secretary, and he being well assisted by an efficient Committee, everything passed off very satisfactorily to all concerned.

The premier prizes of the Show were offered in the class for twelve

varieties of stove and greenhouse plants, not less than four fine foliageed plants being included. Mr. J. Cypher was well first for a most perfect group, which comprised an immense *Phœnocomma prolifera* Barnesi, very fine; *Bougainvillea glabra*, *Allamanda nobilis*, *Statice profusa*, *Erica Iveryana*, *Stephanotis floribunda*, *Allamanda nobilis*, *Erica ampullacea* Barnesi, *Clerodendron Balfourianum*, *Crotons* Queen Victoria and Sunset, *Latania borbonica*, *Cycas circinalis*, all in fine condition. The second prize was well won by Mr. G. Lock, gardener to B. Cleve, Esq., Crediton, Kentia Belmorana, *Crotons* Johannis and Chelsoni, and *Ixora Williamsi* being his best plants. Mr. E. Wills, gardener to Mrs. Pearce, Southampton, was third, and Messrs. W. Brooks & Son, Weston-super-Mare, a creditable fourth. For six flowering plants Mr. Cypher was easily first, and Mr. H. Jones, gardener to J. Canning, Doherty, Esq., Bath, second, the latter having small, but creditably flowered specimens. With six fine foliageed plants Mr. Lock was first, among these being grand specimens of *Dasyliion acrotrichum* and *Crotons* Disraeli and Williamsi. Mr. Cypher followed closely, and Mr. H. Jones third. For four flowering plants Mr. Lock was well first, these including a grand pot of *Eucharis amazonica* with thirty-five spikes. Mr. Wills was second. Mr. Cypher was first in the classes for single flowering plants, and Mr. Lock had a first prize for a grand plant of *Dracæna Warreni*. There were only two exhibitors of six Orchids, Mr. Cypher winning with well-flowered plants of *Cattleya crispa*, *Cypripedium Stonei*, *Odontoglossum Harryanum*, *Cattleya Gaskelliana*, *Cypripedium caudatum*, and *Saccolabium Blumei*. Mr. W. Brooks was a good second. For a new plant Mr. Cypher was first, staging *Cypripedium grande* with three blooms; Mr. Lock was second for *Croton Clevei*, a highly coloured sport from C. Disraeli.

Adiantums were extensively shown, the best six specimens being arranged by Mr. Holland, gardener to W. Ash, Esq., among which was a fine plant of *A. farleyense*. Mr. Wills was second, and Mr. Jones third. The best group of eight varieties of exotic Ferns was staged by Mr. H. Jones, who had a neat *Dicksonia squarrosa*, *Alsophila excelsa*, *Gymnogramma Mertensi*, and *Gymnogramma Wetenhalliana*. Mr. W. Brooks was a good second. The best four Ferns were staged by Mr. G. Wills, J. P. Cassell, Esq., being second. Mr. W. Brooks was well first for six Fuchsias, and was also successful for a single specimen. Mr. Brooks was also first for six Liliiums, and Mr. Holland had the best four Liliiums. Tuberous Begonias were better than usual. Mr. W. Brown, gardener to W. W. Aldridge, Esq., was well first for six varieties, and Mr. Brown was first for four specimens. The best Cockscombs were shown by Mr. A. Durston, and Mr. Hollands had a first prize for *Achimenes*. Messrs. Hollands, Brooks, S. Bisdee were the principal prizewinners in the various classes for Zonal Pelargoniums, Petunias, and Gloxinias.

The competition for cut flowers generally was remarkably keen and good. The best forty-eight triplets of Roses were staged by Mr. J. Mattock, among these being perfect blooms of Louis Van Houtte, Madame Lambert, Rubens, Devienne Lamy, Horace Vernet, Lady Sheffield, Duchess of Bedford, Senateur Vaisse, Marie Baumann, A. K. Williams, Marie Van Houtte, E. Y. Teas, Baron de Bonstetten, and Madame Norman Néruda. Dr. Budd, Bath, was a good second, and Messrs. Cooling third. The first prize for twelve Roses, single blooms, was awarded to Messrs. Perkins & Sons, Coventry, Maréchal Niel, C. Lefebvre, H. W. Eaton, and Mdlle. Annie Wood being especially noteworthy. Mr. T. Hobbs was second, and Messrs. Heath & Son third. Several good stands of Teas were staged, Mr. J. Mattock was well first, his best being Comtesse Nadailac, Francisca Kruger, and Princess Vera. Dr. Budd was second, and Messrs. Cooling & Son third. Dahlias were beautifully shown. Messrs. Heath & Son, Cheltenham, were first for twenty-four distinct varieties, Mr. F. Harris second, and Mr. J. Newman third. Mr. Evry, Bath, was first for twelve varieties, and Mr. Hoskins second. Mr. A. A. Walters, Bath, was placed first for twelve varieties single Dahlias, the second prize going to Mr. J. Carr, Bath. A first prize was awarded to Mr. R. W. Poynter, Taunton, for twenty spikes of Gladioli, Mr. S. Tottle being second; while for twelve varieties Mr. J. Mattock was first, and Mr. Weible second. The prize-winners for Asters in various classes were Messrs. W. J. Jones, Dr. Budd, T. Evry, Cooling & Sons, G. Garraway, all from Bath. The stands of twenty-four bunches of cut flowers was well won by Mr. W. James, Redland; Mr. R. W. Gibbs being a good second, and Mr. Brooks third. In the class for twelve bunches, distinct, Mr. M. Cole, Bath, was well first with a capital exhibit of single and double Begonias, the second prize going to Mr. Holland for a greater variety. No less than thirteen competed in the two classes for vases, and a beautiful display was made. Mr. M. Hockings was well first in both instances, his exhibits being most praiseworthy. Mr. W. Brooks was second, and Mr. T. Meakins third in both classes. Very good also were the bouquets. Messrs. Perkins and Son were well first, Mr. Winstone second, and Mr. W. Brooks third.

The competition in the fruit tents was scarcely so keen as usual, but there was some fine produce staged. The best collection of eight dishes was shown by Mr. W. Iggulden, gardener to the Earl of Cork, Frome, who had fairly good Muscat of Alexandria and fine Black Hamburg Grapes, large richly coloured Barrington Peaches, good Hero of Lockinge Melon, and other creditable dishes. Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, was a good second, his collection including a handsome fruit of his new Melon, good Madresfield Court and Muscat of Alexandria Grapes. The first prize for four varieties was well won by Mr. W. Daffurn, gardener to D. Cox, Esq., who had extra good Madresfield Court Grapes, Hero of Lockinge Melon,

Elruge Nectarines, and Peach Grosse Mignonne. Mr. W. Strugnell, gardener to A. R. Baily, Esq., Frome, was a very creditable second, his Muscat of Alexandria being very good. There were eleven entries in the class for Black Hamburgh. Mr. Iggulden was well first for good sized bunches perfectly finished, Mr. Crocker, gardener to Mr. W. H. Miles, being second with very fine bunches and berries only slightly inferior as regards colour. In the any other black class Mr. W. Daffurn was first and Mr. J. Lloyd second, both having very creditable Madresfield Court. The first prize for Muscat of Alexandria was awarded to Mr. Lloyd, who had good well coloured bunches, the second prize going to Mr. Strugnell for larger but scarcely so well finished examples. In the any other white class the first prize was awarded to Mr. Jones for small but perfectly ripened bunches of Buckland Sweetwater, the second prize going to Mr. Crocker for much larger well coloured examples of the same variety. The first prize for a Melon went to Mr. Lloyd for a fine fruit of a seedling obtained by crossing Hero of Lockinge with Longleat Perfection, and which proved of very superior quality. Messrs. Iggulden, Daffurn, Lloyd, Gullick, and James were the principal prizewinners in various other classes for fruit.

Vegetables as usual were extensively shown, notably in the classes for which the prizes were provided by Messrs. Sutton & Son and Messrs. Webb & Sons. The most prominent prizewinners were Messrs. Garraway, Evry, Tilley, G. Lock, Perryman, J. Reid, and J. Hall.

EXETER.—August 14th.

WANT of suitable space precludes the bringing together of a very extensive display of plants at this annual meeting, but there is no lack of all other exhibits, and nothing but bad weather marred the success of the Exhibition. Mr. G. D. Cann is the Honorary Secretary, and no one can possibly complain of the way in which this gentleman endeavours to meet the wishes of both the exhibitors and visitors to the Show.

In the plant classes Mr. W. Rowland, gardener to W. Brock, Esq., had matters very much his own way, his old and most formidable rival, Mr. G. Lock, being absent. To Mr. Rowland was awarded the silver cup for nine stove and greenhouse plants in flower, among these being large well-flowered specimens of *Ixora Williamsi*, *Anthurium Andreanum*, *Allamanda Hendersoni*, *Ixora princeps*, *Bougainvillea glabra*, *Stephanotis floribunda*, *Lapageria rosea*, and a *Eucharis amazonica* with forty spikes. Mr. Rowland also had a first prize for nine fine-foliaged plants, these including a fine *Arceuthobium rubra*, and good specimens of *Crotons Johannis*, *Disraeli*, and *Andreanum*. The best Ferns were staged by Mr. Rowland, and he was likewise easily first for a circular group of miscellaneous plants 12 feet in diameter. The latter was a very charming arrangement, the groundwork being composed of *Adiantum cuneatum*, out of which sprung numerous elegant Palms, *Crotons*, Grasses, and flowering plants, a ring of *Gloxinias* being especially noteworthy. Mr. A. Williams was second in this class, his group comprising numerous richly coloured and well-flowered plants. The first prize for a group 8 feet in diameter was awarded to Mr. W. Snell, gardener to Colonel Garratt, who had a fresh and bright arrangement, while Mr. T. Prothero, gardener to T. Knapson, Esq., also exhibited creditably, and secured the second prize. The most successful competitors in the fairly well-filled classes for Zonal *Pelargoniums*, *Begonias*, *Fuchsias*, and other flowering plants were Messrs. Prothero, T. Knapson, A. Williams (gardener to W. C. Sim, Esq.), W. Rowland, and R. Staddon (gardener to Colonel Courtney), all exhibiting creditably.

There were thirteen classes provided for cut flowers, and in most of them the competition was very keen. Especially fine were the Dahlias exhibited by Mr. J. Nation; Messrs. S. Crump and A. Williams also competing successfully with these. Mr. R. H. Poynter was well first for twelve *Gladioli*, and Mr. Rowland was first for a collection of choice cut flowers, and Mr. J. Ebbutt a good second.

The greatest interest, however, was centred in the fruit and vegetable classes, in all of which the competition was remarkably good. The best collection of ten dishes of the former was staged by Mr. W. Iggulden, gardener to the Earl of Cork, Frome, who had good Black Hamburgh and Muscat of Alexandria Grapes, highly coloured Belle-garde Peaches, Hero of Lockinge Melon, and other good dishes. The second prize was awarded to Mr. J. T. Ebbutt, gardener to Rev. F. A. W. Hamilton Gell, the Queen Pine Apple in this collection being exceptionally fine. It weighed not less than 6 lbs., and was cut from a plant scarcely twelve months old. In the class for six varieties of fruit, two exhibitors unfortunately included too many fruit in their dishes, and had to be disqualified accordingly. Mr. A. E. Crossman, gardener to J. Brutton, Esq., was fortunate in winning the first prize; Mr. R. Mairs, gardener to Sir J. Shelley, Bart., being a close second; and Mr. J. Sparkes, gardener to H. S. Manley, Esq., was highly commended. Twelve competed in the class for Black Hamburgh Grapes, but Mr. Iggulden was well first, the second prize going to Mr. R. Pike, gardener to the Rev. Pike, who also had good-sized well-finished examples. The best Muscat of Alexandria were staged by Mr. G. J. Barnes, gardener to T. C. Daniel, Esq.; Mr. R. McMillan, gardener to Sir G. S. Stuckey, being second. Mr. J. Langworthy, gardener to G. Benmore, Esq., was first and Mr. G. J. Barnes second for Madresfield Court. Mr. R. Pike first and Mr. J. Langworthy second for Buckland Sweetwater. Mr. Iggulden first and Mr. J. Mayne, gardener to E. Allen, Esq., second for Foster's Seedling, the exhibits being creditable, and the competition good in each instance. Mr. G. J. Barnes staged a good fruit of Stodleigh Court Seedling in the class for a green flesh Melon; Mr. Crossman being second with a seedling of his own raising. In the class for a scarlet

flesh variety, Mr. Iggulden was first with a good fruit of Blenheim Orange, the second prize going to Mr. W. R. Baker, gardener to the Rev. L. D. Acland. Mr. Iggulden was the most successful in the various classes for Peaches, Nectarines, and hardy fruits, taking eight first prizes in all; and other prizewinners were Messrs. W. Martin, gardener to Lord Poltimore; R. Mairs, W. Snell, J. Moggridge (gardener to J. Langworthy, Esq.), Yeo, and W. R. Baker, J. H. Copp (gardener to W. E. S. Erle-Drax, Esq.). Mr. C. Bull, gardener to General Sir Redvers Buller received a first prize for a fine fruit of Smooth Cayenne Pine Apple, Mr. W. Snell being second.

Vegetables were largely shown, not only in the classes for collections, but also as single dishes, and throughout the quality was good. The best collection of twelve varieties was set up by Mr. G. H. Copp, who had very fine Wright's Giant White Celery, Autumn Giant Cauliflower, Veitch's Main Crop Onion, Snowball Turnips, Pragnell's Exhibition Beet, Duke of Albany Pea, Ne Plus Ultra Runner Bean, Lyon Leek, Sutton's Seedling Potato, Ellacombe's Parsnip, New Intermediate Carrot, and Perfection Tomato. Mr. R. Mairs was a good second, his best dishes being Perfection Tomato and White Gem Celery; the third prize going to Mr. W. R. Baker, who also had capital vegetables.

There were several non-competitive exhibits, which added greatly to the general effect. The most noteworthy among these was a long bank of Palms, Japanese Maples, Ferns, Lilliums, Orchids, *Begonias*, and other choice flowering and fine-foliaged plants, with which were associated large quantities of cut *Gladioli*, *Roses*, and herbaceous plants, all artistically grouped, and which were contributed by Messrs. R. Veitch and Sons, Exeter. Mr. S. Randall, Exeter, and Mr. W. B. Small, Torquay, also arranged effective groups of plants and cut flowers, and Mr. B. R. Davis had a very attractive exhibition of cut blooms of Tuberous *Begonias*, a class of plants which he has long made a speciality with the best of results. The doubles were especially good, notably *Mauvette*, *Conical*, *Althæflora*, *Miss Hayward*, *Lorna Doone*, *Dandy*, *Ivel*, *Mistress French*, *Gardeniæflora*, *Robin Adair*, *Picotée*, and *Octavia*.

SUTTON AND CHEAM.—August 14th.

THE above Society appears to be increasing in popularity each year, the Show on Wednesday last being pronounced by the Judges to be the best that has been held in the district. Unfortunately the afternoon was wet, and consequently many people were prevented from visiting the Exhibition, and also the pretty grounds in which it was held, belonging to H. L. Antrobus, Esq., Cheam House. The Society has for several years been favoured with fine weather, and the Committee has wisely placed a surplus with their Treasurer in case of a rainy day. The specimen plants were exceptionally fine. Mr. W. King, gardener to Philip Crowley, Esq., Waddon House, Croydon, was again successful in gaining the premier award for twelve stove and greenhouse plants, which were large, clean, and very fresh. Among the foliage plants a fine specimen of *Dracaena Lindenii* and a richly coloured *Croton Queen Victoria* were conspicuous; large plants of *Bougainvillea glabra*, *Allamanda grandiflora*, and *Dipladenia amabilis* were well flowered. For his eight foliage plants he received a similar award for remarkably well grown plants. Mr. T. N. Penfold, gardener to the Rev. Canon Bridges, Beddington House, was a good second in both classes. He had also the best half dozen exotic Ferns, showing *Microlepia hirta cristata*, *Asplenium nidus avis*, and others in capital form. Mr. J. Cook, gardener to S. Ezekiel, Esq., Sutton, was second with smaller but healthy plants. For a single specimen plant in bloom Mr. King and Mr. Penfold were placed equal second, the former having a large *Pancratium*, and the latter an equally well-bloomed *Bougainvillea*. The six *Selaginellas* from Mr. J. Cook and Mr. W. King were good specimens of even size.

The groups arranged for effect were a great feature, and in the open classes Mr. May, gardener to F. C. Jacomb, Esq., Cheam Park, a well-known orchidist, was awarded the chief honour with a meritorious group in which *Lilliums*, *Begonias*, *Cattleyas*, *Phalenopsis*, *Odontoglossum Alexandræ*, the bright *Epidendrum vitellinum*, and *Oncidium Kramerii* were arranged with Ferns and foliage plants. Mr. King was a close second with a very light and tasteful arrangement. In the corresponding class for local gardeners, Mr. W. Rogers, gardener to J. Flemwell, Esq., Sutton, had the best, which contained plants of *Hydrangea paniculata grandiflora*, with large showy heads of bloom, *Lilliums*, small and well-coloured *Crotons*, the whole finished with Maidenhair Ferns and *Panicum*; Mr. J. Cook following with a pretty group, his most telling plants being a well-flowered *Vanda tricolor*, *Cypripediums*, *Oncidium Lanceanum* and *O. flexuosum*, with light *Aralias*, *Cocos*, &c.

Two good banks of Tuberous *Begonias* were set up by Mr. W. Rogers and Mr. C. Keel, gardener to W. Petley, Esq., Worcester Lodge, and the prizes were awarded in the order named.

Large and grandly flowered *Fuchsias* were shown, the half dozen from Mr. S. Broughton gained him an easy first prize. Mr. J. Slater, gardener to Mrs. Hulse, Carshalton, was second with smaller but well bloomed specimens. Mr. Broughton was also the most successful for six Balsams. For a similar number of double Ivy-leaved *Pelargoniums* Mr. W. Rogers secured first honours with well-grown plants. Mr. G. Smith, gardener to G. Orme, Esq., had the best four double Zonals and also the best six singles, all of which reflected great credit on the grower. *Gloxinias* and *Begonias* were well represented.

The competition for Mr. E. Morse's prizes for twelve bunches of hardy herbaceous flowers was good, Mr. W. Slade, gardener to G. Foster,

Esq., having a superb stand and good variety. Mr. A. Carter, gardener to Alderman Evans, Ewell, also had an extremely pretty exhibit. For twenty-four varieties of cut flowers Mr. T. N. Penfold and Mr. C. Gibson of Chrysanthemum fame divided the honours, both having choice selections. Dahlias were well shown by Messrs. Carter, Slater, Broughton, Cook, Penfold, and W. Jupp, gardener to Cuthbert Johnson, Esq., Croydon, the latter taking several prizes in other classes.

Several good stands of Roses were exhibited, Mr. Broughton and Mr. Gibson having the best twenty-four. Mr. Broughton also had the best twelve blooms. For a hand bouquet Mr. T. Butcher, Croydon, was an easy first, having an arrangement of choice white blooms, with *Lælia elegans* mounted above. Miss King, Wallington, and Mr. T. Hogg, Sutton, also had very creditable productions. Sprays and button-holes were very good.

Three pretty designs for the table were arranged by ladies, Mrs. Bacon being first and Mrs. Bantry second, and one from Mrs. Petley was highly commended.

Fruit and vegetables were well represented, the latter being remarkable for the number of entries, which were good, especially the collection of six varieties of Potatoes. The Judges perhaps had more difficulty in deciding the awards in this class than in any other in the Show. Those from Mr. C. Blurton, gardener H. Cosmo-Bonsor, Esq., Kingswood Warren, were finally declared the best; Mr. V. Vickery, gardener to G. Steer, Esq., Wallington, second. Mr. C. Osman, South Metropolitan District Schools, was third, an extra prize being awarded Mr. J. Cook. The others were good. Messrs. Sutton & Sons' prizes for a collection of vegetables went to Mr. Osman, Mr. G. Woodham, Model Farm Gardens, North Dulwich, and Mr. S. Broughton in the order named.

Grapes were fairly well shown. The best Black Hamburgs came from Mr. Slater, Muscats from Mr. Penfold, and Messrs. Blurton had the best Buckland Sweetwater and Madresfield Court. Messrs. Cheal & Sons offered a prize for the best collection of fruit, this being secured by Mr. Woosfold, Messrs. Smith and Carter taking second and third prizes. The classes for single dishes of fruit were all well filled except that for Apricots, only one lot being staged: The amateurs were fairly represented, Mr. E. Wilkins, Sutton, being one of the most successful.

The cottagers were in strong force, and their produce was of great excellence. The prizes offered for bouquets of wild flowers for children brought nearly ninety exhibitors, and great taste was shown in the arrangement of most of them.

There were several trade and other exhibits not for competition. Mr. C. Osman had an interesting stand of ornamental Gourds and the pale Mont d'Or runner Bean. Messrs. Cheal & Sons had Cactus, single and double Dahlias, backed up with a collection of choice plants from Mr. E. Morse, Epsom. Messrs. J. Laing & Sons had a charming group, including choice single and double Begonias, the pretty *Saxifraga sarmentosa* tricolor superba, and a new white *Antirrhinum*, together with boxes of Rose blooms and Dahlias. Mr. T. Silence, gardener to W. R. G. Farmer, Esq., Nonsuch Park, exhibited a fine dish of Sutton's Perfection Tomato.

Mr. J. Box, Croydon, had a stand of useful horticultural sundries and a group of plants artistically arranged. From Messrs. J. Peed and Sons, Streatham, came a beautiful group of plants edged with herbaceous cut flowers, boxes of Roses, &c. They also showed large examples of Webber's Early White Potatoes. Seven pounds were planted by them last spring, and when lifted the produce weighed 222 lbs.

DUNMORE EAST HORTICULTURAL SHOW.

THIS is an annual event, taking place on the 15th August ("Lady Day," and in Ireland a holiday); and is always of considerable local importance. This year there was an additional attraction to sightseers in the presence of the Channel and torpedo fleets, the latter having Prince George of Wales on board—all anchored in the bay, in front of this fashionable small watering place. Prince George came ashore along with the sailors, talked freely with the people, and mixed with them, quite unattended by any state surroundings, and it is amusing to hear the stories told by the people of his affability, and their surprise when they found they had "a real live prince" among them without any of the usual imposing retinue. The Society, now many years in existence, is under the presidency of the Hon. Dudley Fortescue, Summerville, and an excellently constituted Committee, comprising the local clergymen of each denomination, half proprietors and half gardeners, with the Rev. J. D. Forde and Mr. Harvey as the official Secretaries. It is to be hoped when the present state of tension among classes in Ireland passes away each town, nay village, will have their horticultural show, with a somewhat similarly constituted Committee as in England and Scotland. There were sections for plants in pots, cut flowers, fruit, and vegetables, with a children's class for pupils of the national, convent, and church day schools, and an outdoor window garden department. A detailed account of each of those sections, with the first and second prizewinners in each, would occupy more space than you are likely to be able to afford, so I shall content myself by merely saying that the various exhibits from year to year, by honest emulation, show a steady improvement, thus benefiting, contrary to an occasionally expressed opinion, both the employers and the gardeners. In plants, cut flowers, fruit, and vegetables among the principal prizewinners was the President, the Hon. Dudley and Lady Camilla Fortescue (gardener, Mr. J. A. Calthorpe), Summerville, whose fine marine residence I recently tried to describe in the Journal; Mrs. Malcomson of Villa Marina, Dunmore East, and

Ballinakill, Waterford (gardeners, Mr. Dunphy and Mr. Noonan); Lady Carew, Woodstown (gardener, Mr. O'Brien); Sir R. Paul, Ballyglan; Messrs. White, Strangman, Mrs. Jacobs, &c., Waterford, with many local competitors.

Messrs. Saunders' Collections, Friars Walk Nurseries, Cork.—These were among the great attractions of the Show, and embraced stands of Roses, Hybrid Perpetuals, and Teas; Tuberous Begonias, single and double; Show and Fancy Dahlias; and a further stand of forty-eight trusses of single and double Zonal Pelargoniums, all distinct varieties. A special feature of the firm was a large stand of hardy outdoor flowers, which included *Gaillardia maxima grandiflora*, *Alstromeria aurea*, *Aconitum superbum*, *Phygelia capensis*, *Montbretia Potsi*, *Agapanthus umbellatus* (perfectly hardy at Cork), *Campanula pumila* (very fine), *Helianthus multiflorus*, *Lobelia cardinalis rubra*, *Francoa appendiculata*, *Hyacinthus candicans*, *Delphinium formosum*, and *Anemone Honorine Jobert*. These were well grown and shown, and as hardy flowers are so seldom patronised at local shows, it is worth specially noticing what we may have. The Dahlias were wonderfully fine for the time of the year, showing the advanced climate of the south of Ireland; but the following double Begonias excited just admiration:—*Blanche Duval*, *Felix Crousse*, *Pavillon Jaune*, *Madame Dumest*, *Madame Marie*, *Candidissima plena* and *virginialis* (both desirable whites), *Fleur de Thé*, M. Paul Vig, and *Louise Goussaincourt*. These were not for competition, and were awarded a first-class certificate by the Judges.

The exhibits were arranged in a large marquee, about 100 yards long, with an adjunct for the Judges and the press, under the immediate superintendence of the Rev. J. D. Forde, and many of those were of exceeding merit, especially in the stove and greenhouse plants from Summerville, Woodstown, and Villa Marina; the fruit from Ballinakill and Summerville; and the vegetables from Ballyglan. Crowds gathered in the town during the day, and divided their attention among the Show, the unrivalled marine scenery, and the naval fleet. The Judges, press, and officers were entertained at the palatial residence of Mrs. Malcomson, Villa Marina, the former being Mr. John Crehan, Minella, Clonmel; Mr. H. Crawford, Kileronagh; and your correspondent.—W. J. MURPHY, Clonmel.

CRYSTAL PALACE.—AUGUST 17TH.

AN extensive Show was opened in the Crystal Palace, Sydenham, on Saturday last in connection with the various Co-operative Societies in Great Britain. It was advertised as a "flower show," but it would have been more appropriately termed a "vegetable show," as the exhibits in the latter classes largely predominated, and very rarely is such a representative display of produce from small gardens seen in metropolitan exhibitions. There were altogether about 4000 entries from 350 competitors, and the entries ranged up to as many as ninety in some of the classes, giving the Judges plenty of scope for the exercise of their powers of selection. The whole of the central portion of the two naves was devoted to the Show, and the exhibits were arranged on tables at short intervals, the groups of plants between assisting to diversify the appearance of what would otherwise have been rather flat and monotonous.

The schedule enumerated 230 classes, 115 being in section 1 for members of industrial co-operative societies, and the remainder were for gentlemen or their gardeners, members of the Association. In the first section the prizes ranged 30s. to 2s., and some of the classes eight prizes were offered. The collections of vegetables were of most creditable quality altogether. Beans also were largely and well represented in all sections. Potatoes had four classes devoted to them, and the tubers were generally very satisfactory in appearance. Currants, Onions, Shallots, Tomatoes, Vegetable Marrows, Turnips, Cabbages, Parsnips, and Cucumbers were all well shown, but Celery, Leeks, and Peas were not in first rate condition, the last named being mostly too old.

In the cut flower classes those for annuals brought numerous competitors, Asters, Phlox Drummondii, Zinnias, Marigolds, Godetias, Tropæolums, Sweet Peas, Coreopsis, Echecholtzias, Clarkias, and Mignonette being chief favourites and the best represented. Bouquets were fairly good and varied in character, but a trifle too crowded in most instances, a common fault in shows of this kind. In the classes specially for particular flowers the most numerous were Stocks, Asters, French and African Marigolds, the latter especially fine. Phlox Drummondii, rather spoiled by being shown in stands and with paper collars. Petunias had a poor effect staged in the same way. Mignonette was good, also Dahlias, Zinnias, and Roses for so late a period; Gladioli bright but small spikes; Heliotrope was good, also *Helichrysums* and Sweet Peas, the last named being excellent; *Antirrhinums* were poor; *Amaranthus* is not fitted for exhibition, and Hollyhocks were unfortunately far behind what used to be seen some years ago even in small shows. The plants in pots did not constitute a satisfactory feature, few were equal to those seen at an average cottagers' show. Fruit, comprising chiefly Gooseberries, Plums, Raspberries, Black, White, and Red Currants, and Apples with a few Pears were all creditable samples.

In section 2 the vegetables were excellent the collections particularly so, Messrs. Waite, Beckett, and Phillips securing the leading prizes. For a collection of fruit Mr. L. Budworth, gardener to C. Hill, Esq., was first with black and white Grapes, Plums, Cherries, Nectarines, Peaches, and a Melon, Mr. Waite and Mr. J. Butler following closely. Cut flowers were also good in this section, and much more varied in character than in the other classes.

FRUIT FORCING.

MELONS.—Let the last plants be placed out without delay. Preserve the leading shoot until it reaches two-thirds across the trellis, pinch out the point, rubbing off the laterals up to the trellis, and then every alternate one on the opposite sides of the primary. Maintain a temperature of 65° to 70° at night, and 70° to 75° by day, 80° to 85° from sun heat, closing early so as to increase to 90° or 95°. Stopping the laterals should not be practised unless the plants are weak and they do not show fruit at the second or third joint. Weakly plants must have the first shows of fruit removed, relying on the sub-laterals. Early ventilation with plenty of light is essential to thoroughly solidified growth.

Pits and Frames.—The latest plants in these are swelling freely. Earth up the roots if necessary, but late plants on dung beds do not require a large amount of soil. Close early, affording the needful supplies of water at that time, keeping laterals well in hand, not allowing them in any way to interfere with the principal leaves. If the weather be dull afford good linings and admit a little air, as nothing is so fatal to Melons as a close atmosphere. Sprinkling should only be practised on fine afternoons. If black aphides attack the plants fumigate on two or three consecutive evenings moderately. Examine frequently for canker, and promptly apply quicklime to the affected parts. Gradually withhold water at the roots and moisture in the atmosphere from plants ripening their fruit, and if a little extra heat is afforded by means of linings so as to admit of a free circulation of air, the quality of the fruit will be enhanced considerably. Damp weather is very disastrous to fruit ripening. The fruit should be raised well above the soil and foliage, keeping it clear, and to prevent moisture condensing on the fruit admit a little air constantly. In a close moist atmosphere the fruit swells freely enough, but when it is ripening often becomes cracked and decayed.

CUCUMBERS.—Encourage the plants for autumn fruiting to make strong growth by adding fresh soil from time to time, affording plenty but not too much water at the roots, with a moist genial condition of the atmosphere by syringing at closing time and damping available surfaces occasionally. Sufficient fire heat must be employed to prevent the temperature falling below 65° at night, and to maintain it at 70° to 75° by day. Old plants should have the exhausted growths cut out, and others where likely to be crowded thinned, so as to admit light and air, securing a sturdy solidified growth and a succession of bearing wood.

The syringe should be regularly employed about 3 P.M., and if mildew appears dust with flowers of sulphur in the evening whilst the foliage is damp, maintaining a somewhat freely ventilated atmosphere. Black aphides are often troublesome. These and green aphides succumb to repeated fumigation with tobacco, taking care to have the foliage dry, the smoke cool, and to ventilate freely the following day.

PEACHES AND NECTARINES.—*Planting or Lifting Trees for Early Forcing.*—If new houses have to be filled, and fruit is wanted next season at an early period, plant the trees as soon in the late summer or early autumn as the growth is perfected, the wood and foliage being ripe and the buds plumped. The most suitable trees are those that have been two or three years trained to walls, and have been lifted annually or biennially. Those intended for moving to houses to be started early ought now, if there is any tendency to a late growth, or any doubt as to the maturity of the wood and buds, to have the soil taken out as deeply as the roots one-third the distance from the stem that the trees extend, and the trench so made should remain open for a fortnight or three weeks, when it may be filled again, care being taken that the trees have sufficient water whilst the trench is open. All that is necessary, however, is to prevent severe flagging. This will effectually check the growth and ensure ripening, whilst it will materially assist lifting with a ball or mass of fibrous roots. Plant the trees for early forcing by the end of September, and commence lifting early forced trees as soon as the foliage gives indications of falling. It will not matter about a few eappy laterals, the softness will tend to the manufacture of roots. Soil should be obtained in readiness, so that work of this kind can be performed with the utmost promptness and despatch. Provide clean drainage too in different sizes. The soil may consist of any good loam, preferably strong and calcareous, nothing being lacking in the top 3 or 4 inches of an old pasture overlying limestone or chalk, and if intermingled with flints all the better. Such will grow Peaches and Nectarines to perfection without any admixture. If the loam be at all light add a sixth of marly clay as finely divided as practicable. Any deficiency of calcareous matter may be overcome by an addition of chalk to sandy soil, and of lime rubbish to heavy soil. New borders must have efficient drainage, the bottom of the border being concreted if the soil beneath be unfavourable, or better laid with bricks on the flat run with cement, the border being further enclosed with walls, so as to confine the roots. A border one-third the width of the trellis will be sufficient in the first instance. It is essential that the drains

have proper fall and outlet, rubble being placed over them a foot thick, the roughest at the bottom and the finest at the top, and if covered with a layer 2 or 3 inches thick of old mortar rubbish the drainage may be considered sound for an indefinite period. Twenty-four inches depth of border is ample. The best varieties for early forcing are Alexander; Waterloo, a high-coloured and taking fruit of high quality, but unfortunately a clingstone; Early Rivers, which, however, is liable to split at the stone; and Early Beatrice. All points considered the best of the four is Alexander. Where extreme earliness is not considered the finest varieties for early forcing are Hale's Early, Early Alfred, Royal George, or preferably Stirling Castle, and Grosse Mignonne, which are free setters, and good alike in appearance and quality. Of Nectarines Lord Napier is superior, and when properly thinned swells to a large size, and finishes very satisfactorily. Both Elruge and Violette Hâtive are suitable to continue the succession, being in every respect excellent.

KITCHEN GARDEN.

SOWING AUTUMN ONIONS.—We have sown these from the 1st of August until the end of September. The former were too early and seeded before bulbing in spring, while the latter were too late, but if sown about the end of August they are right in every way, and this is now our usual time of sowing. The common types sown at this time are the Giant Rocca and Tripoli, but any of those generally sown in spring, such as James' Keeping, Rousham Park Hero, and others of this class may also be sown now, and they will form excellent bulbs before the same sorts sown in the spring months. All ground for autumn sown Onions should be rich in lime and manure. Then there is no danger of failure from grubs, and the bulbs will become large and good. The seed may be sown broadcast, but we prefer rows, and always sow in this way. The ground should be forked over, broken and cleaned, and the drills may be opened to a depth of 2½ inches at a distance of 10 inches or 1 foot apart. As soon as the soil has been placed over the seed tread it well down, and when the surface is so dry as not to be sticky the hand roller may be taken over it with advantage, as a firm soil is highly conducive to the production of sturdy plants that seldom fail to stand the winter well.

HARVESTING SPRING-SOWN ONIONS.—The present is a good Onion year. The bulbs we have seen at shows and elsewhere have been remarkable for their size, symmetry, and firmness, but they will not improve much after this time, and as long as the weather is good they may be drawn up and dried with the view of storing them for the winter. If the majority of the plants have thick necks begin by pressing these over close to the bulb. Let them remain in this form a week, then draw them and lay them down on the surface of the ground where they have been growing with the bulb facing the sun. After a week in this position they may be removed and placed under cover, but in a light airy place, and there they should be spread out in a thin layer and allowed to dry further without taking the tops off. These will soon dry, and they may be cleaned any time afterwards: with us this is work on a wet day. If Onions are intended for tying in strings the stems should be left about 6 inches in length, but if they are only to be laid up in a heap the stems may be cut close to the bulb. Where pickling Onions are deficient the smallest may be picked from the main crop and used for this purpose.

CHIRK CASTLE TURNIP FOR WINTER.—This is our favourite variety for use from December onwards, and all who value a good Turnip in winter and spring should grow it. As is well known to all who have cultivated it, the skin is jet black and the flesh snowy white. The quality is first rate, and as the bulbs bury themselves well in the soil this no doubt accounts for their remaining so good all through the winter and in the most severe weather. Ours have just been thinned, but there is still time to sow the seed with the certainty of securing useful bulbs.

THE LATEST CELERY.—Through all quarters being full of summer crops we were unable to plant the whole of our Celery for the latest supply at the usual time, and it is only now some hundreds of plants are being placed in the trenches. These are mostly where Pea rows have been, and as the ground was well manured for the Peas it has not received any now, but shallow trenches are formed and the Celery planted. We do not expect it to become large, but it will attain a useful size before November, and it will be much hardier in winter than that which has been forced into a large size by early planting and a rich soil.

OLD CABBAGE PLANTATIONS.—We regard the old Cabbage plantation as one of the most valuable stores of winter greens we possess. It is astonishing the number of small heads supplied from it throughout the winter, and on until the new Cabbages are almost ready again. We have known times when many of the winter Broccoli and other greens were killed and the Cabbage sprouts drooped as if they would never rise again, but as the season advanced they sprung up and yielded a copious supply of tender and well-flavoured vegetables. It is therefore to the advantage of all to give them attention, and they should all be examined, the decayed leaves removed, the large weeds pulled out, and the whole surface freely and deeply stirred with the Dutch hoe.

LATE KIDNEY BEANS.—Although all vegetables are so plentiful at present it must be remembered that the time will soon be here when they will quickly become scarce, and attention should now be directed to carry on the supply as late as possible. The best way to do this is to limit the supply at present, and retain the vigour of the plants for later fertility. This practice applies to many crops, but to none more than to Runner Beans. These have been wonderfully fruitful of late. It

is years since we had them so prolific and good. The pods have formed much more quickly than they could be used, the supply has far exceeded the demand, but the pods that are now filling with seed will effectually prevent the later ones forming or swelling, and the seed will soon cause the plants to cease bearing. To allow this to occur would be a great mistake, and it is best to gather the whole of the old pods, allowing none to remain when they have become too old for the table, and the late blossoms will form into pods that will be excellent until they are cut down by frost.

THE PEA SEASON.—While the season now fast passing has suited the majority of vegetables, it has been an admirable one for Peas. The quantity and quality have been excellent, and is still good, and the latest crops are very promising, but as these are influenced considerably by the weather, and are apt to be deficient if the autumn prove unfavourable, the utmost attention should be given them. See that they are all well staked; do not allow any of the stems to bend over for want of support, as on the part beyond the pods will fail to fill. Should very wet sunless weather occur and they are disposed to run to growth, pinch the points out, as this will induce the bloom buds to form. At the same time see that they do not suffer from drought, and if there is any danger of this water copiously with liquid manure before they are far advanced in fruiting, as good feeding is necessary to make the pods fill late in the season. When the fruit is finished the birds are apt to turn their attention to the Peas, and it is often necessary to place nets over them to protect the pods.

PLANT HOUSES.

Pa'ms.—Where these are infested with small scale every endeavour should be made to clean them. This scale is easily destroyed with petroleum and water, but great care is necessary in its application. The oil drains into the centre of the plant, and often proves injurious if strong applications are used and the plants stood upright again directly they have been syringed. Three ounces of the oil may safely be used to each four gallons of water, but the first application will not destroy all the scale; it may have to be repeated three or four times in succession at intervals of a fortnight. The best way to syringe Palms with this solution is to slightly incline the pot so that the stem and fronds of the plant hang downwards. This prevents any oil reaching the centre. The leaves, if possible, should not be allowed to touch the ground, or they may be injured by the oil that collects and floats on the surface of water on the floor. The best plan is to move the plant to a fresh position as soon as it has been syringed, so that its leaves are free from the floor.

Cissus discolor.—For covering the back wall of a stove or other warm house few plants are more beautiful. The main branches of the plant should be trained at the top, so that all the young growths will hang downwards in a natural manner. When trained under the roof and well treated it grows so rapidly that it quickly forms a dense shade. From time to time liberally but judiciously thin the shoots, so that a good per-centage will hang in a natural manner. This plant does not display half its true beauty when trained in a stiff formal manner. With good treatment and liberal feeding it will continue to grow until the end of the year. Perhaps at no season does it look more beautiful than during the sunless days of autumn. The foliage can then be used with advantage for many forms of decoration.

Bertolonias.—Side shoots may now be taken off, as they root freely in sphagnum moss and sand in a close propagating frame, or under bellglasses in the stove. A few tops may also be taken and rooted, so that cuttings will be produced for next year's stock. Young plants rooted now pass the winter in better condition than plants with large well-developed foliage. The latter are almost certain to damp.

Aralia leptophylla.—Specimens that have grown too tall for use in 5 or 6-inch pots may be cut up at once for yielding suitable decorative plants in spring. If the old plant is cut off close to the soil it will break again into growth, and in due time make a good specimen again. The remainder of the stem should be cut up into lengths of a little more than 2 inches, and inserted singly in small pots in sandy soil. If plunged in the propagating frame and shaded from the sun all will form roots and break into growth from the top eye. At the first potting afterwards the portion of old stem above the soil in the small pots can be buried. Plants required for decorative purposes during the autumn and winter becoming too tall in their present quarters should be gradually hardened and given cooler treatment for a time.

Ananassa sativa variegata.—A few well grown plants are worth a place in a stove on account of their distinctive character and striking appearance amongst other plants. To produce good plants quickly leave the suckers upon the parent until they are sufficiently strong for 5 or 6-inch pots. If inserted in sandy loam they will root freely enough arranged in the stove with other plants. The only defect in this plan is that the soil is liable to get wet before it is filled with roots. Where practicable, it is a good plan to plunge the pots, covering the surface of the soil and rim of the pots with the plunging material until they are well rooted. By this means no water will be needed before roots are formed if the soil has been moderately moist at potting time. If suckers are not freely produced before the plant fruits there is no difficulty in getting the necessary quantity afterwards.

Anthericum variegatum.—In from 4 to 6-inch pots few plants are more conspicuous in appearance or more useful for various forms of decoration. This plant will certainly thrive in a cool house, but it grows much more quickly in heat, and young plants should be treated to nearly stove heat until they attain a decorative size. Under cool

treatment the plant is very slow, but in heat suckers are produced much more quickly. It is necessary to grow the stock plants moderately warm for this purpose. It grows freely in good loam, sand, leaf mould, and one-seventh of manure.

Tillandsia (Vriesia) hieroglyphica.—For rooms and various forms of decoration this plant might be grown much more generally, for few, if any, plants last in rooms in good condition for the same length of time. For this purpose propagation by suckers is too slow, and therefore seedlings should be obtained. Hitherto we have failed to save seed, but found no difficulty in having seedlings obtained for us. This plant requires 4-inch pots, and grows freely in loam, peat, leaf mould, and sand. Plants in this size are very effective when from 6 to 8 inches high, especially if a few small seedling Ferns and dwarf mosses have been established on the surface of the soil. They require stove heat, but after they are large enough they will stand for weeks in any structure without injury.

THE BEE-KEEPER

NOTES ON BEES.

TIERED HIVES.

"WHILE tiered hives are undoubtedly the largest producers, still it is a loss to attempt frustrating the swarming mania, and as swarms always work the best we should take them the first opportunity and make the most of them." This is the concluding paragraph of an article in the Journal, and one to which many will, in my opinion, take great exception, and therefore in order to prevent what appears to me to be a wrong impression from being circulated it is necessary to consider the meaning of these words, which in themselves, taken in separate sentences, and not as one whole collective paragraph, are absolutely true, yet when taken together convey an opinion that it is quite impossible for me to endorse even by silence. That tiered hives are the largest producers is an undoubted fact, and the loss and folly of attempting to prevent the issue of a swarm when once a stock has determined to throw off its surplus population is as certain, while nobody will for one moment deny that swarms work with more energy than an old stock. All this is true, but the question is whether in hives managed skilfully on the "tiering" system the swarming mania ever arises at all, because the main object of this system is by giving sufficient room to prevent any desire to swarm, not letting the desire arise and then attempting to crush it. By the tiering system not only is more honey produced, but the greater quantity is produced at less trouble and expense, while the quality is not by any means inferior. If a stock throws off a swarm the best use possible must be made of it, and it is not wise to attempt to return it, although a cast may alike with ease and certainty be returned upon the day of issue with profit to the owner unless in somewhat exceptional circumstances.

STEWARTON HIVE.

Last autumn I procured one of these hives, but was at the time unable to stock it. Eventually, however, after driving a skep which weighed 96 lbs., the bees were, together with some driven bees from some other hives, placed in the boxes, and now form a strong and valuable colony.

FEEDERS.

On hearing a man who occasionally looks after some stocks in the absence of their owner complain about the trouble he had in feeding in autumn with the ordinary round tin feeder, I had what appears to be an evident improvement made in one of them, and so satisfied was he that he said that "feeding was now a pleasure." I give the idea for what it is worth, although quite possibly the principle upon which it is constructed may be very old, and many such feeders be in use already. The difficulty he experienced was this, that when he lifted the tin cover to pour in the syrup the bees rose and occasionally attacked him, much to his sorrow and discomfort. I had therefore a funnel attached to the outside of the feeder with a connection into the feeder just below the "wooden float," so that the syrup would, entering beneath the float,

gradually raise it without touching the bees. The level of the syrup in the funnel outside is the index of the level inside, so that any child can take a can and fill the tin, covering up the funnel with a small piece of zinc or tin, and not a bee escapes, nor is there any necessity to move the lid of the feeder until it is desired to close up the hive at the conclusion of the feeding. This contrivance may with ease be attached to the ordinary feeder by those who have experienced a like trouble in former years.

THE SEASON.

Results this year seem to have been fairly satisfactory, for while white Clover was in bloom the bees had now and then an opportunity to collect in quantity, although in this district the weather has never been so continuously favourable as to admit of a large harvest being stored, except in the case of those who took pains to always have their stocks in readiness for the honey flow. From tiered stocks I have had from seventy to eighty 1-lb. sections apiece of good quality, but the largest sized skeps seem never to have really appreciated the amount of honey waiting to be gathered; but although not giving any great weight of super honey they are heavy and will yield a good return, the honey from the one driven a few days ago being of splendid quality and colour.

SELLING.

My advice to bee-keepers is to sell their honey as soon as they can get a reasonable offer; but what "reasonable" means must be left to the individual to discover, because what would be an excessively low price in one place seems to be considered a fairly good one in a locality less favourably situated for the disposal of bee produce. It is a mistake to hold over in the hope of a rise in the market anything of such a very perishable nature as honey in the comb, unless in exceptional cases. Neatness, cleanliness, and quality are the great essentials to packages of honey, and for a good quality, especially of Clover honey, there appears to be a ready market at prices varying from 1s. to 1s. 3d. a pound. These prices will leave the producer a large margin of profit on all well-managed stocks, and those who have not taken sufficient care to produce honey in quantity must, as the result of their prior neglect, see their more energetic neighbours making profit while they are estimating their loss or vainly attempting to form a favourable balance sheet. Run honey should be bottled in vessels with good wide mouths, not narrow necks like so many of the bottles of honey put up for sale. When the honey is granulated it is most difficult to extract it from such jars, upon which the ingenuity of the maker seems to have been specially spent in order to prevent the unfortunate possessor from getting out of them with ease and comfort whatever for the time being they may happen to contain. Pretentious labels are an eyesore; prettiness combined with simplicity is much more to be admired than a gaudy monstrosity out of taste with the vessel and its contents.—FELIX.

PUNIC BEES.

"A LANARKSHIRE BEE-KEEPER," page 121, asks if I have noticed these bees working very early in the morning. I thought that I had in my previous articles said or implied as much, when I said that they work concurrently with the humble bees; that is, the pure race. I have not had much experience with their crosses yet. They begin work at "peep 'o day," and before the sun begins to show above the horizon they are at full swing carrying in pollen, &c. The best stock of bees I have at present is one with a pure mated queen that has built up from a two-frame nucleus since spring.

I have been very busy this summer investigating the reason bees swarm. They have repeatedly swarmed without a queen in the hive, and they have swarmed time after time with only a virgin queen in and no means of rearing a successor. Several times I have removed the old queens and a few bees; firstly, to prevent swarming; and secondly, to make up a nucleus, and in each case they and their bees went back to old stock and then led off large prime swarms. Neither plenty of space, both below and above frames, would prevent them swarming; but for all that I do know of two plans that will prevent bees getting into the "swarming fever" and yet keep them as strong as possible. I have also been able to get demonstrative proof of the use of fertile workers in the economy of Nature. I have always been sure that Nature had a reason for them, but it was not until 1886 that I got any indication what their existence was for. Since then I have been on

the look out for absolute proofs, or the means to get such, and at last I have succeeded, thus solving an enigma that has been a puzzle to naturalists for 100 years.—A HALLAMSHIRE BEE-KEEPER.

EXHIBITION OF HONEY AT THE CRYSTAL PALACE.

THE National Co-operative Flower Show was held in conjunction with the Festival at the Crystal Palace on Saturday last, August 17th.

A section of the Exhibition was devoted to honey and wax, the British Bee-keepers' Association giving silver and bronze medals, and, at the request of the Co-operative Societies, appointed the judges in this department—Mr. John M. Hooker and Mr. Alfred Neighbour. The following are the awards:—

For the best collection of comb and extracted honey, staged on a space of 6 feet by 2 feet 6 inches.—First prize, of 50s., Mr. Baldwin, Bromley. Second, of 30s., to Mr. Cudd of Chislehurst. Third, of 20s., to Mr. Dance of Halstead, Essex. The first and second taking the medals of the B.B.K.A.

For twelve 1-lb. sections of comb honey.—First, of 20s., to Mr. P. Hills, jun., Great Baddow, Essex. Second, of 15s., to Mr. Thos. Duncomb, Horsham, Sussex. Third, of 7s. 6d., to Mr. S. Bailey, Horsham. Fourth, of 5s., to Mr. Baldwin. Fifth, of 2s. 6d., to Mr. H. Kerridge, Ipswich. Highly commended, Miss A. M. Runcieman, Chelmsford, Mr. Potter, Braintree, and Mr. Geo. Cole, Braintree.

For twelve 1-lb. glass bottles or jars of run or extracted honey.—First, of 20s., to Mr. Wm. Nott. Second, of 15s., to Mr. Wm. Newman, jun., Great Baddow. Third, of 7s. 6d., to Mr. A. Jones, Gloucester. Fourth, of 5s., to Mr. Prentis, Grays, Essex. Mr. P. Hills, jun., highly commended.

For the best British wax from the exhibitor's own hives.—First, of 10s., to Mr. Thomas Dance. Third, of 5s., to Mr. H. Kerridge.

For honey in applied forms.—First, 10s., to Mr. H. Kerridge, for mead. Second, of 7s. 6d., to Mr. Dance, for mead. Third, of 5s., to Mr. H. Kerridge, for vinegar made from honey.

The comb honey in sections, with the exception of the first three prize lots, was not so good as we should have expected to have seen it. Exhibitors have yet to learn how to get the corners filled.

The exhibits of extracted honey were a very fine lot, for the most part beautifully clear and bright coloured. The exhibits of honey were sent from Bedfordshire, Berkshire, Gloucestershire, Kent, Essex, Norfolk, Suffolk, Surrey, Sussex, and were a great improvement for quality and quantity on former years.

Thanks to the British Bee-keepers' Association this industry is now better understood, and purer honey is now obtained, than was formerly the case when the wasteful practice of smothering the bees and draining the honey from the broken combs of honey and brood altogether.

TRADE CATALOGUES RECEIVED.

E. P. Dixon & Sons, Hull.—*Autumn Catalogue of Flower Roots.*
Dobie & Mason, Deansgate and Oak Street, Manchester.—*Catalogue of Hyacinths, Tulips, Crocus, &c.*
Sutton & Sons, Reading.—*Catalogue of Bulbs, 1889.*
B. S. Williams, Upper Holloway.—*Catalogue of Bulbs, Fruit Trees, Roses, &c.*
John Peed & Sons, Roupell Park Nurseries, Norwood, S.E.—*Bulb Catalogue, 1889.*
J. Carter & Co., High Holborn.—*Bulb Catalogue, 1889.*

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Judging Picotees (J. W.).—The schedule you sent has not helped to elucidate matters very much, as the class provides for "Pinks and Picotees," and if we remember rightly the former were not mentioned in your previous letter. However, the principle upon which you acted

is the correct one, failing any stipulation that distinct varieties are required.

Heat for Old Vine (J. G.).—Though it would not be wise to commence forcing the old Vine with brisk heat in January, we should expect it to be considerably improved by the judicious application of fire heat, starting it steadily into growth towards the end of February or early in March, increasing the temperature in the usual manner with increasing growth. If the wood is not ripening a little fire heat now with very free ventilation and not a high night temperature might be considerable advantage.

Offensive Pond Water (H. J. P.).—As evidence of the danger of carbolic acid for plants, it is sufficient to say that an ounce of it mixed with a gallon of water is used for destroying weeds on walks. If you can char some thick pieces of wood—that is, convert them into charcoal, then throw them into the pond, your object may perhaps be attained, and the water remain as safe and good for the plants as before. Sulphate of lime (gypsum) is also good for the same purpose, and safe; and 1 or 2 per cent. of sulphate of iron (green vitriol) prevents water becoming offensive, and in that small proportion is not injurious to plants, but in some soils may be beneficial.

Removing Dahlias (E. G. N.).—Your plan may answer provided you cover the tubers with nearly dry sand, and keep it dry, in the coolest place you can find, as if warm and moist there would be a danger of the buds, which should remain dormant till the spring, pushing in the autumn. Under the special circumstances of the case it might be a good plan to drive a spade down just beyond the tubers and under them now, for cutting some of the fibres sufficiently to cause the leaves to flag a little, thus checking growth gradually instead of arresting it suddenly by digging up the plants when in full vigour. It does not follow that the position in which you cover the tubers after taking them up will be the best place for leaving them through the winter, and probably it will not. If you describe their condition in October we shall be glad to give further advice.

Cutting off Strawberry Leaves (Cambridge).—We are neither able to agree with you nor your gardener. We have seen Strawberries bear fairly well when all the leaves have been mown off after the fruit was gathered in early summer, but have not considered that as proof of the soundness of the practice so much as of the vitality of the plant and its power to recover from rough usage. When gardeners grow Strawberries in pots they endeavour by good cultural attention to produce the finest possible crops, and they know very well they would not succeed nearly so well as they do if they cut off the leaves. The better the foliage the finer the crowns and the heavier the crops. Our practice is to clear all runners and rubbish from Strawberries immediately after gathering, with the object of developing fine leaves under the full influence of the air, thus storing material in the crowns for the formation of strong flower trusses as the primary condition for fine fruit. We consider the right time for removing the old leaves, if a right time there be, is when they are quite withered in the spring. They are often of great service in protecting the crowns in the winter. We scarcely know which we least admire, the proposition of yourself or your gardener, but we should not like either of you to dress our Strawberries.

Unhealthy Vines (Amateur).—You are no doubt correct in surmising that the border is unable to afford the Vines the requisite support for maintaining them in a healthy state. If it is "wet and heavy," as you suggest, that alone is sufficient to account largely for their present condition, and it may be deficient in the constituents that Vines need as well. We could have formed a better opinion on the case if you had sent fair samples of the wood and stated the age of the Vines. If they are old as well as having "very few and very thin shoots, with the leaves dried up at midsummer," the best course to adopt would be to make an entirely new border and plant young Vines. These would not bear fruit next year, or it would be very unwise to allow them to do so, but a few strong fruiting canes, either grown in large pots or planted without materially disturbing the roots, would probably afford a better supply of Grapes than the old Vines are capable of producing, however they may be treated now. The crop of next year depends on healthy and matured growth of the present season; and if your Vines practically lost their leaves at midsummer, and the laterals are "very few and very thin," it is too late to change their condition this year. No doubt the Vines can be made to produce stronger growth and better foliage next year, which, with good management, might be retained till the autumn, and the following year (1891) better Grapes might be expected. But this would involve making a new border, and either the Vines would have to be taken up, laying their roots in soil, at the same time covering the canes and keeping them moist till a new properly drained border were ready for their reception; or the old soil could be forked out from between the roots and these surrounded with new soil, due provision being made for the escape of superfluous water. As we assume the Vines have few or no leaves, the work may be done at any time, or not later than the first week in September, taking care the roots are not dried during the process of border renewal, and it is desirable that the rods and canes be left moist also by syringing and shading. But if they are in the exhausted state your letter implies, and especially if they are old, the most satisfactory return for the labour and outlay would be derived from planting young Vines. Mr. Barron's "Vines and Vine Culture" is the most complete work on the subject; price 5s., post free 5s. 3d. from this office.

Naming Potatoes (Several Correspondents).—During the present week we have received several parcels of Potatoes containing from one to a dozen tubers of as many assumed varieties to be named. The senders of them have evidently forgotten or not seen the intimation that has been more than once published of our inability to undertake to name Potatoes. Tubers can be identified by comparison with collections at exhibitions.

Names of Fruits.—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (W. J. M., Hants).—The Pears are not in a condition to be named. 1 is perhaps Beurré Diel; 2, Beurré Clairgeau; 3, Jargonelle. (H. H.).—1, Beurré Giffard; 2, not known. We cannot name Plums without stalks or young shoots.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (F. C. B.).—*Spiraea Douglasi*. (W. R.).—1, *Adiantum decorum*; 2, *Asplenium viviparum*; 3, *Doodia aspera*. (A.).—*Eupatorium cannabinum*.

POINTS OF GOOD HUSBANDRY.

CLOSE attention to trifling matters of detail is an important factor to successful farming. Take for example manure; about nothing is there greater diversity of opinion, yet all will agree that there is much carelessness and waste in the preparation and use of manure. Without great care huge heaps of farmyard manure cannot be made without waste, and such waste is best avoided by carting green manure straight from the yards upon the land and ploughing in at once. There is then no building or turning of manure heaps, no second carting, no loss of ammonia. The manure should of course be made under cover, which can easily be done, for a roof can be put to any yard for about 2s. 6d. per square yard—not of roof, but of the yard. Upon this basis a calculation of cost can easily be made, and it should be understood that durable roofs of comparatively slight material may be constructed provided stout supports are used with principal rafters, beams, and king posts 7 by 3 inches. We have recently had to reconstruct several roofs simply because substantial main timbers were not used in the first instance. On the home farm the Mangolds had green manure carted direct from the yard into the furrows, where it was spread, and at once covered by splitting the ridges with a double-breasted plough; the roots are already very fine, and the entire crop compares favourably with any upon our off-hand farms.

Adjoining the Mangolds is a field of Swedes, which well illustrated another good point of husbandry. This field gave a good crop of Barley last year, which was followed by a catch crop of Rye sown in September. The Rye was consumed in folds by ewes and lambs, the ploughs followed closely, and the Swedes were sown early very soon after the Mangolds. We thus gained the double advantage of an early green crop for sheep, and a sufficient dressing of manure for Swedes, which are a full vigorous crop, highly satisfactory. It will be understood that the Swedes were sown upon the flat immediately after the ploughing, in order that the moist soil might induce quick germination of the seed and a brisk growth, so that the young plants might soon be out of danger of injury from fly. The season has on the whole been so favourable for roots that full successional crops are now a certainty.

Lime dressing may be said to be a form of manuring, as lime is really a plant food. It is usually only recommended for clay and alluvial soil because it is so valuable an agent for opening up clay, and its action on vegetable matter is so vigorous and effective. We have also used it to great advantage upon sandy soils, as well as the thin silicious soil of the Hastings sand formation, and there is no doubt it is applied with advantage to all soil deficient in lime. About 3 tons an acre is a fair dressing, and it should be applied in summer to long fallows or bastard fallows. This is done at intervals of from five to ten years precisely according to the nature of the soil. It sinks in the soil more or less slowly, and a little observation will enable one to decide how often it should be used. To show what stress practical men put upon the importance of lime dressing, we may mention the remark of the "Royal" judges of a prize farm in Nottingham in 1888, that without regular periodical lime dressings it would probably be worthless—with them, under good management it was awarded a first prize. Of the action of lime in soil we may say that it sweetens it by neutralising organic acids; it tends to destroy excess of humus, and by its action on vegetable matter sets free ammonia, water, and nitric acid, which it takes up; it sets free potash and other alkalies, and renders harmless injurious salts.

These few scientific deductions are given because the popular idea of the effect of lime is very vague and indefinite.

It may also be said that there is a considerable degree of uncertainty about the use of all fertilisers, and it is matter for regret that farmers do not ascertain for themselves all about the wants of the soil and how to supply them in the best way. Every farm has its special requirements, and no experiments tried elsewhere can be of more than general use. If a man confines himself to the use of natural manure he need trouble himself very little about experiments; but upon a large farm chemical manure must play its part, and without the application of some test to the soil it is impossible to know what to use. The special mixtures of manure dealers may or may not answer; in any case they point to a probable loss which ought to be avoided. To avoid such loss Norfolk farmers have formed an association for the purchase and preparation of such manures under the management and guidance of an able chemist, which gives them an immense advantage, for they thus obtain genuine manure blended in correct proportions for their special requirements at a very low cost.

WORK ON THE HOME FARM.

The hindrance to harvest work by wet weather has been most serious. Heavy rain set in soon after the reapers were in full swing upon the Wheat, and then for three or four days the Wheat had to be left alone. We were able to get on between showers with winter Beans and seed Tares, but the outlook was certainly gloomy enough. On light land forward Barley must have suffered. Corn generally on such land was ready for carting, and we travelled for many miles through fields with the corn all in shocks under a heavy rain. Such inclement weather brings out good or bad work among the shocks, and we regret to say we saw many with all the sheaves thrown down and saturated with rain. Picasant indeed is it to see how thoroughly in earnest the workmen are in the harvest field; and while it is most desirable that they should push on the work as fast as possible, yet the little extra care required to set up the sheaves securely must be given, and need not prove a hindrance if only the right way of doing it is acquired. Set the sheaves firmly on end, and press the tops of every pair firmly together, make the rows north and south, and be quite sure to leave the ends open. This last hint is necessary. On the day of writing this note we saw a number of shocks with a sheaf in each end, so that it was impossible for the wind to blow through or the air to circulate among the sheaves as it ought to do.

With such unfavourable weather not an hour of sunshine must be lost when it does come. Wheat ripens quickly, even between clouds and sunshine, and if left out too long much of it will be shaken out. The most troublesome thing in a wet season is the rampant growth of weeds and layers of Clover or mixed seeds among corn, and the best plan is to leave rather a long stubble, as there is much risk of damage from overheating, especially among Barley and Oats. In the Fen district the work is very heavy, for the crops are abundant, and the corn is much heated down. We hear much of the pluck and energy of the British farmer, and he certainly has need of them when to low prices for his farm produce are joined the trials of unseasonable weather. Such difficulties doubtless develop character, and while they are met with a firm resolve to do all that can be done to overcome them a large measure of success will crown our efforts.

REMARKS.

11th.—Fine early, dull at midday; showers and distant thunder in afternoon and evening.
 12th.—Cloudy with slight showers in morning; fine afternoon and evening, with one or two gleams of sun.
 13th.—A little sun early; cloudy day.
 14th.—Fair morning, wet afternoon and evening.
 15th.—Bright and fine.
 16th.—Warm and generally bright.
 17th.—Showery till 9 A.M., generally cloudy in morning; heavy shower at 1.15 P.M.; fine and bright afternoon and evening.
 A dull showery week with temperature near the average.—G. J. SYMONS.

MR. GLADSTONE ON FRUIT CULTURE.

A FEW years ago, when Mr. Gladstone advocated the cultivation of fruit for jam-making purposes, he appeared to be misunderstood by a considerable section of the community. He was, by those who thought the line a good one to take, represented as advising owners and occupiers of land to relinquish the cultivation of ordinary farm produce and "grow jam." Probably those who made the most of the subject from that point of view knew very well that nothing of the kind was meant, as nothing of the kind was said. Fruit culture for jam production was advocated as a home pursuit worthy of extension, as an adjunct to, not as a substitute for, the usual farm crops. That speech, though commented on in various ways, and to a large extent adversely, as are most of the utterances of distinguished men, nevertheless gave a great impetus to fruit culture and to the production of jam on a more extended scale and of better quality than before.

Mr. Gladstone has again spoken, and made his meaning clear, which he has often failed to do on the first attempt. He now says, after speaking of the advantages we as a nation possess in cheap sugar, that so long as it remains cheap, "it may be said for such fruits as will be grown in this country that there will be an appetite; that there will be means enough for making it into preserves in jams, and the world at large will have plenty of appetite and plenty of means of consumption of all the jam that is made." Then he goes on to say, "I do not think it is going to cause a revolution in the state of agriculture. Not at all. British agriculture must depend, not upon the smaller, but the larger culture, upon the production of the great staples on which mankind must live, because though jam is a very good thing, yet mankind would not live upon jam." Those, he declares, to be his views generally, and really believes the whole subject is interesting and important. So do we, and we believe, further, that if the best is made of our resources the value of our exports in the form indicated may soon equal, and in time exceed, the value of the imports of Apples that reach our markets from America and other fields of production.

We do not mean by a very long way that British growers of fruit cannot compete far more successfully than heretofore with transatlantic cultivators in the supply of Apples for our markets. They can do so, and there is scarcely a doubt will do so as time goes on. We look for steady improvement in our home supplies when the better chosen varieties that have been, and will continue to be, planted come into bearing, and when the growers generally learn, as not a few have done, the best manner of placing their fruit in the markets. The negligence that has been apparent in orchards during the past generation, and the loose slipshod manner of marketing the fruit, gave an opportunity to our competitors of which they took advantage both in culture, packing, and uniformity of samples. It is easy to abuse them for doing so, and the law for permitting them, but the real fault rests with the lack of effort at home to work on the same sound lines. The ancient trees have been trusted too long to supply the public want, and failed as soon as the produce of the young and more vigorous was placed in comparison.

Purchasers do not ask, nor care, where fruit is grown. They

want the best and best looking for the money they invest. It is all very well to appeal to the patriotism of consumers, but the patriotism of nearly all of them is in their pockets, as it is of those who make this claim against them. The best samples of British Apples never fail to meet with a ready sale, and these excel in quality the best that are imported, and are very few points, if any, behind in appearance; but Apple crops are prone to fail through weather vicissitudes. They have often been scant and unprofitable for four or five years together, then good seasons have followed. These alternations will occur again. Fruit foes, in the form of insects and caterpillars, may be combated, though the work may often be difficult; but it is not in the power of man to prevent a week of rainy weather or a few nights of sharp frosts during the blossoming period, either of which visitations are fatal to good crops of fruit. These occurrences, however, ought no more to prevent endeavour in growing the best Apples in abundance than ocean accidents should prevent ships being sent to sea because some are occasionally lost. The point we wish to enforce is this—if the best, and especially the most certain, return is to be derived from fruit culture reliance must not be placed on Apples alone, but soft or jam-making fruits should have a large share of attention. Our advice to all who can carry it out is to grow more of the best Apples, and grow more of the best small fruits too, for in these when well preserved we have a great and good customer in the "world at large."

Moreover, these fruits are the easiest to grow, the quickest in yielding profit on outlay, and the least likely to fail in affording satisfactory crops. Those who have taken note of the fruit crops over a long series of years know that this latter statement is correct. During the present year the crops, as a rule, of jam-making fruits have been far more profitable than Apples or Pears. There may be exceptions, and no doubt there are several, but after making the fullest allowance they do nothing more than prove the rule. Experienced cultivators of fruit for market combine the two kinds, and they are wise. This combination can also be carried out in small gardens, such as Mr. Gladstone had, perhaps, mainly in view when addressing his audience, though his remarks had at the same time a much wider significance.

The veteran statesman passed on to another subject—the transformation of barren Pear trees into productive Apple trees by grafting. His remarks were founded on a short communication he had discovered in the *Journal of Horticulture*. His discernment is noteworthy, for if we recollect there is nothing so precise on the subject in any of the previous issues of the paper over a period of forty-one years. Without doubt Mr. Kerl recorded his experience with accuracy in establishing a number of Apple scions on Pear stocks, and he sent us fruit from the trees. We shall be glad to learn more about his plantation. We have had specimens of Pears grown on Apple stocks, for some very good ones were sent to us by Mr. Samuel Stevens, F.L.S., from Upper Norwood two years ago; but until last year we had not seen Apples from a Pear stock, though we may hope to see more. We have established Apple scions on Pear stocks, and they grew very well for a few years, then either died or were blown out, showing that the union was not satisfactory. Mr. F. W. Burbidge in his valuable work on the propagation of plants records several instances of success in establishing Pears on Apple stocks, some of these of several years' duration, though so far as we know not one example of Apples bearing on Pear stocks is there recorded. It is practically certain since Mr. Kerl's experience is made so widely known that several barren Pear trees will be cut down and grafted with Apples, and in time some of them may, and we hope will, bear fruit. Something like a revolution will then be effected in the fruit world that would perhaps meet with more general acceptance than some of the reforms which the right honourable gentleman above mentioned has been instrumental in carrying out during his long and active career.

When Mr. Gladstone speaks again on the subject of fruit we should like to submit to him the desirability of advocating the cutting down of healthy Apple trees which either bear little or no fruit, or fruit of little or no value, and graft them with free-bearing sorts of proved merit, which we shall be glad to recommend. If the thousands of trees of the character indicated were treated as suggested, the Apple supply of the kingdom would be enormously improved in a very few years. Without wishing to deter persons from making experiments in converting Pears into Apples, we prefer to be responsible for the advice to make barren Apple trees fruitful, and turn those that bear useless fruit into producers of valuable crops. There is no doubt that this can be done, but there is a doubt that the interesting union of Apples and Pears can be generally and usefully effected.

As fruit growing and cottage gardening are subjects in which I have taken a deep interest for many years, I am glad to find that Mr. Gladstone has again drawn attention thereto. It is simply a waste of words to argue that we need more fruit. Fruit consumption is growing daily, and we are still daily exchanging vast sums of money for fruit imported from abroad. As to the desirability of our growing more fruit, I question very much if there is any difference of opinion. The real difficulty lies in our unlearning foolish customs. We follow too much old beaten tracks, and in fruit growing especially apparently forget that these tracks were formed when, of necessity, we had principally to depend on our own fruit for all the days of the year. In olden times we had a little of all things, and of all possible varieties, whereas the need of the present day is quantity of any one variety, and that to be of the best possible quality, and to be sent to market in the best possible form.

I have just been in Nottinghamshire, and though I passed by many orchards after leaving home I only saw one that, during the present season, would give any profitable return. Plum orchards might be excepted, the Victoria especially. This is the difficulty, but especially difficult here in the north. We plant hundreds of varieties of Apples, and over a period of time we have not twelve that will pay to grow. After the last sunless season all that have crops this year, we may take it for granted, are varieties adapted to whatever locality they may be found in. With me Cellini, though a rather small Apple, takes the palm; and all the Keswick tribe, Lord Suffield, and others are bearing profitably. I had previously heard of some wonderful bearing Apples that were largely grown by Mr. Merryweather of Southwell, Notts, and sure enough on this gentleman's extensive establishment I had a surprise, his Bramley Seedlings and his Russians (Duchess of Oldenburg) especially being something to both think about and wonder over. As I have already said, in olden times we grew a number of varieties for a year's supply, but now it is the fact that I can name a dozen fruit salesmen in Newcastle alone who will buy at a fair price all the Apples of good quality, of any one variety, that all the fruit growers of the north of England can supply. Yet we foolishly stand trembling about oversupply. I say again, as I have many times said before, let all favourably situated pasture fields be planted with not more than six varieties of Apples, and before twenty-five years are past these same fields for their Apples alone will yield from £20 to £50 an acre. In the meantime, as trees are growing, sheep will be feeding, and as surely the millions of money will be diminishing that we now send abroad. As to the planting, let it be well done, and then with a piece of copper wire run a few 4 or 5 feet memel plaster laths together, like Venetian blinds, and tie them round each stem to protect from rabbits and hares. At first this protection may go two or three times round to admit of expansion as the trees grow. Next put these trees under the charge of those who love fruit-growing, and so secure attention when attention is necessary. Of jam I might say the

surprise is the rapid strides the trade has made since Mr. Gladstone drew attention to it.—JAMES WITHERSPOON, *Red Rose Vineries, Chester-le-Street.*

THE CYCLAMEN.

THE gardening papers frequently devote a page or paragraph to Cyclamens, and wherever two or three gardeners are banded together as a society a paper or essay on the same subject is periodically contributed. Why is it, then, that Cyclamens are not grown better? Some nurserymen grow them exceedingly well, but in the majority of private places are they any better grown now than they were say fifteen or twenty years ago? Those who travel and visit can answer that question best. My experience (not a very wide one by the way) induces me to hazard the suggestion that during the history of the plant in question it may have been possible to grow it worse, but not much.

The neglected-looking specimens we so often see, with curly leaves and crippled blooms, are so many libels on the character of these beautiful plants. On the other hand, when we see well grown examples with ample dwarf foliage, handsomely marbled and brilliantly coloured symmetrical flowers, we willingly admit that no time is wasted in bringing them to such perfection, and that nothing can be more attractive and useful during the dullest months of the year.

Cyclamens when seen in good condition at a show command the admiration of all. Employers see and envy; gardeners admire, but despair. "Yes, they're grand, but we cannot do them at our place; so-and-so has special houses and men, and they must have special treatment to get them like that." Of course they want "special treatment," so do all plants. You would not treat Calceolarias and Chrysanthemums alike. What Cyclamens do not want is neglect. Herein lies the whole secret of success or otherwise. Red spider or green fly if tolerated will soon produce troublesome results, while too much water, too heavy or frequent supplies of food, entirely upset their constitutions. Yet they are not so very fastidious. Their wants are within the resources of most places; simplicity of retail and constant attention are surprising invigorators.

Some time in August the seed should be thinly sown in pans of sifted soil, two parts loam, one each leaf mould and sand; slightly cover the seeds and soak by holding the pan in water (but it must not flow over the sides of the pan), plunge to the rim in a cold frame, cover with a square of glass, over which spread a few handfuls of the plunging material. Some recommend bottom heat for the seed, but after repeated experiments I find a greater percentage germinate in the frame and make sturdier growth afterwards. When the seedlings are seen to be pushing through admit light gradually, but keep the glass over the pan till the leaves touch.

About the middle of September remove the plants to a cool house for a week or two. They are best, however, in an intermediate house from the beginning of October to the end of March. As soon in the new year as convenient prepare one or more boxes (mine are 30 inches long, 18 wide, and 3 deep), in the usual way, employing the same soil as before, but a trifle rougher, and prick off the seedlings 3 inches apart. These boxes will be found far preferable to small pots. Uniformity of moisture, both for the roots and the foliage, is maintained better; and this is very important while the plants are small. Under these conditions insects will not be troublesome. If, however, a few are perceived a very small quantity of tobacco powder will convey the necessary hint. If kept close to the glass and sparingly watered the middle of March should find the plants with good balls of roots and ready for another shift. From the boxes to 4½-inch pots is a good move, potting moderately firm; this time using three parts loam, one leaf soil, one manure, and a liberal dash of sand well chopped and thoroughly mixed, but not sifted. Put one large crock in the pot and a good supply of the roughest of the mixture. When potted return them to the same house for another fortnight, then remove them to a cool house; syringe night and morning, shade from bright sunshine, and water carefully.

Now is the time to look out for insects; examine the hearts frequently, as that is where the damage is done, and when green fly is observed you have the signal for a general dipping. Fumigating does more harm than good; it injures the leaves if too strong, while a light smoke will not penetrate and kill. Softsoap, at the rate of a quarter of a pound to three gallons of water, is safe and effectual. There is little difference between a cool damp house and a cold frame during the summer. Both answer for Cyclamens equally well, except that a house is usually provided with a blind, which of course is better than a permanent shade. If a frame is decided upon the plants may be placed there about the middle of May; in a month from that time they should be ready for their final potting. Mix the soil as before, using 7-inch pots, and plenty

of crocks for drainage. The advantage of putting one crock only in the smaller pots will now be seen; the roots enjoy the coarse soil, and undisturbed the ball can be repotted entire. Ventilate freely night and day, pinch off blooms that occasionally appear, annihilate pests, and wait patiently for winter; then, if the grower is not rewarded for his trouble and care with compact globular heads of healthy foliage from 12 to 15 inches through, and a profusion of bloom for at least five months, particularly in February and March, it will not be the fault of the plants.

Cyclamens flower even more freely the second year with suitable treatment. When the first season's flowering is finished remove to the cool house again, but drying off must not be practised. As fresh young leaves are observed repot into 8 or 10-inch pots. The 7-inch pots ought to be full of active roots, and to dry off or shake out under such circumstances is murderous treatment. If they are not well supplied with roots consign them to the rubbish heap; let the foliage die off naturally, and repeat as previously advised. Three-year-old plants are disappointing. At no time should too much manure be used with the potting mixtures, cow manure not at all. Feeding will not be required until the autumn, and must not be overdone then. Always keep the plants near to the glass. Direct sunshine distresses them, making the leaves flimsy; this is not good, and should be avoided. I have seen several sowings advised, but one will be found sufficient for most places, as the plants do not all flower at the same time.—S. Y.

TREATMENT OF SOILS AND MANURES.

(Continued from page 153.)

EACH of the three parts of soil have their constituents in different forms. The active is ready for plant life; the dormant is principally composed of "bases," ready to unite with active acids; the inactive part is a mass of elements in a latent state. The larger part of soil being inorganic proves that the mineral elements are far in excess of that required by plants. It is possible to exhaust the soil of mineral constituents by heavy cropping without returning any of those elements to the soil. They can be reduced by bad cultivation, but not in that case exhausted, as the action of the rain and atmosphere, &c., would convert the dormant matter into active plant food. A farm has come under my notice where the land has not received a coating of manure of any sort for at least forty years, yet twenty to twenty-four sacks of corn per acre is the return each time of reaping—quite an "Eldorado" the farmers will say; but the owner knows the value of the land, and farms it himself.

The grand secret to reap all the benefit of the soil is good working of the land, and any extra wages judiciously spent in tilling are saved ten times over, as the application of artificial manures will not be required. Take a small quantity of soil, place it in a glass, fill with water, and allow it to stand a while, then strain through an unsized piece of paper into a basin, and place in a position that the water can evaporate without any dust getting into it. You will have left a residue of active plant food. Again, add a little water to the soil left in the glass, and digest it in a hot oven, or even add a little cesspool water to it, filter again through the paper, and treat as before. This test will give a proof of the quantity of dormant matter capable of being made active by cultivation, or by natural causes in time. Apply diluted sulphuric or other acid, and treat as before. This will show the result of longer cultivation, and with stronger acid some of the inactive portion of the soil will be compelled to yield some of its elements for plant food, as it would by long cultivation. The action of the air when the soil is turned up to its influence has the same effect as the weak or stronger acids have upon the soil tested, and acids put into the soil in manures have a similar effect upon the subsoil. I recommend that a portion of the subsoil, if only a few spadefuls in each trench, be thrown over the surface, to be exposed to the action of the frost, for by this means some of the essential elements will be brought within the reach of the plants.

I stated that cesspool water should be thrown over manure heaps in covered yards, but on most establishments more would be created than could be used in that way. When emptying cesspools the contents should be preserved in a heap of potting refuse and protected from the air and rain, and if turned over once or twice till it is dust dry it can be used as a top-dressing in rainy weather, and be more useful than any artificial manure. I remember 30 tons of spring Onions being grown on an acre of land with only the assistance of natural manures and not on rich alluvial soil, which they like.

Blood is often at the disposal of the gardener together with dead animals. The practice in this district amongst some—as blood can be procured here in any quantities for nothing—is to dig a trench at the foot of their Vine or Peach borders, and pour in the mixture

in a crude state. The effect is that all the soil surrounding the blood, &c., is putrified, and no roots will enter it. A Vine border came under my notice which had been the cemetery for all the dead animals on the estate for years. In remaking the border I noticed a Vine root had been near the surface soil for a considerable time, but had gone down to seek food in the sweet sterile subsoil rather than enter the putrid mass. Blood is composed of phosphoric and sulphuric acids, together with phosphate of lime, sulphate of magnesia, oxygen, chlorine, and sodium; or 100 parts of blood contain 80 per cent. of water and 20 per cent. of solid matter. If reduced or decomposed by fire the ash, which is 1 to 2 per cent., consists of half sea salt, the other half peroxide of iron, lime, carbonic acid, sulphuric acid, together with magnesia, potash, and soda. All these useful elements being in blood, can anyone doubt that it is a good fertiliser? It is undoubtedly good, but often badly used. To reap the full benefit of its four-fifths of water, as well as the one-fifth of solid matter, level a portion of the waste heap, and throw over it the blood, cover it with soil, and repeat the process till a sufficient quantity is made. Keep it well covered from the rain, and when the blood is decomposed to a dry state have the heap repeatedly turned till it is properly pulverised; then you will have a heap of manure superior to any bought material. I made a heap last year of about 200 loads, mixing with it lime; but that requires great care, or all the ammonia may be lost. Lime is best put on the soil by itself to mix with the blood oxides there, by which means each application will improve the effect of the other as a source of plant food.

Lime (calcic oxide) is often misapplied. Heavy dressings are given to light lands that are often very fertile, and rendered, therefore, sterile. The effect is very rapid in taking into combination sulphuric, phosphoric, chloric, and carbonic acids, carrying them down into the subsoil, if they are not used at once by the plants, rendering the soil devoid of active matter to a certain extent before the ground can be again worked. The chemical effect of lime is more rapid on light and peaty soils, particularly if applied in a hot state. The best means to supply lime to boggy or very light soils is by an application of marly clay, which is rich in carbonate of lime and also alumina, supposing that to be essential. Clay improves the texture of the soil in retaining moisture, and consequently assists in supporting plants for a longer time. Tenacious clays should be exposed to the action of the frost and pulverised before being dug in. Garden soils are not often boggy, though sometimes very light, in which case it is preferable to burn the clay and apply the residue. Light dressings of lime to soils full of humus are very beneficial, and as lime is often easier to get than clay, I ask that it be used carefully, so as to give the expected benefit instead of causing failure. The application of lime to heavy soils is of more service; it acts chemically upon the clay parts, and assists in separating them so as to allow a freer current of air, which in its turn also assists in drying and severing the stiff parts. The first important thing, however, is to drain strong wet land before uselessly wasting money and energy in the forlorn hope of improvement. I may treat on this subject in some future paper, and will assume for the present that the subsoil is porous and only the surface needs improving. More often than not a layer of clayey loam, through which water can scarcely percolate, exists between the surface and the gravel subsoil. This impervious layer must be removed, or if only at a short distance from the top it may be worked with some burnt clay, gravel, sand, or light soil from other parts of the garden. If sand is close by place a foot or two at the bottom of the manure heap or yard, and apply this to the heavy part once or twice, or charcoal or cinder ashes can be used in the same way till the soil is in a condition to suit the gardener and the crops.

Soot is so common that it is scarcely necessary for me to dwell on it at any length. Its component parts are carbon, ammonia, gypsum, nitric acid, &c. Carbon absorbs much oxygen with other gases, particularly the obnoxious; in fact it sweetens the soil and also improves its texture, especially if heavy, and gives off carbonic acid for the sustenance of the plants. The ammonia and nitric acid give nitrogen, and gypsum calcium, &c. Soot is one of the most useful of fertilisers, and can be used without much danger either as a top-dressing or mixed with the soil, or in the form of liquid manure.

There are many other manures within the reach of the gardener upon which I feel competent to treat, and will continue the subject in a future issue. Two printer's errors occur in my previous communication. On page 152 the sentence should have read, "This dug (not dry) ground is helping the gardener," and on page 153 dry or trenched should have read "dug" or trenched.—G. A. BISHOP.

It would have been more prudent if Mr. Bishop, who admits that "he does not feel equal to the work of giving instructions to

the scientific," had limited his advice to the proper storage of stable manure and the best means of utilising it in the growth of plants, in which doubtless he is thoroughly experienced; but notwithstanding his repudiation of scientific knowledge he devotes the principal part of his article to a description of chemical actions and reactions which is certainly not in accordance with the recognised authorities on the subject. The confusion in his statements is so extraordinary that it is difficult to disentangle and deal with them directly without entering into details too long for a letter; but one or two of them may be selected in justification of my criticism.

He states that "the nitric acid formed from artificial manure unites with the bases in the soil and forms nitrate of soda, magnesia, and potash, &c." As the nitric acid in artificial manures is almost always in a neutral state, combined with soda and potash, it is difficult to understand how it can recombine with those bases in the soil. Then, again, he states that "carbonic acid is abundant in all manures from stables and cowsheds, and is also deposited on the surface of the soil as carbonic di-oxide, which is taken in direct by the plant." Carbon di-oxide is merely the chemist's name for carbonic acid, and is not deposited on the surface of the soil, and even if that were possible it would be useless to the plant, as the enormous quantity of carbon, about half of the whole substance of the dried plant, is derived from the carbon di-oxide of the atmosphere (Sachs), and not from manure, stable or artificial. Mr. Bishop instructs us that "there are four principal elements of plant life—potassium, calcium, magnesium, and iron." Considering that phosphorus is present in every plant, and without it growth is impossible, and, further, that annually hundreds of thousands of pounds are expended on it as a manure and comparatively little on calcium, magnesium, and iron, phosphorus might be considered a principal element. Mr. Bishop divides soil into "three different forms of constituents—the active, the dormant, and the inactive." The active ready for the service of the plant; the dormant has to be roused by some of the constituents of the manure applied or by the oxygen of the air; and the inactive is only made active by long cultivation or the application of strong manures. What are the strong manures? Surely Mr. Bishop, who despises artificial manures cannot refer to them; but his division of the constituents of soil is not scientific. He omits the largest division, about 95 per cent. of the whole, consisting of sand, clay, gravel, &c., which give only mechanical support to the plant and afford absolutely nothing to its nutrition. His last two divisions should be only one, consisting of humus, organic detritus, and undecomposed minerals, which by the united action of cold, heat, carbonic acid, and oxygen are first disintegrated and then decomposed, when having become soluble they are capable of absorption by the plant.

He says, "the only practical advantage artificial manure has over natural is that nitrogen is retained in the former." Is it of no advantage to know the exact composition of the manure, and to be able to economically apportion its ingredients to the actual requirements of the several crops, and secure that each plant shall have a sufficient supply of its dominant constituents? For instance, an extra proportion of potash for the Vine and Potato, and of soda and lime for the Apple, &c. Is it no advantage to be able to effect with a handful of properly compounded artificial manure all or more than could be done with a barrowful of stable manure, the value of which, according to Mr. Bishop, is very uncertain? Then, again, stable manure is not always procurable, while artificial can be had at any time, and its carriage is much less costly, as 1 cwt. of the latter is at least equal to 2 tons of the former.

It is only possible to approximate a sound conclusion by giving full consideration to both sides of a question; the relative value of stable and artificial manure is well worthy of this consideration, but before Mr. Bishop again attempts to depreciate the value of artificial manures I recommend him to consult the authorities on the subject, some of whom have devoted their lifetime to its study; and before he again essays to teach the chemistry of manures to endeavour to acquire some knowledge of the rudiments of the science, otherwise to follow the good advice in the old adage, *Ne sutor ultra crepidam*.—EDMUND TONKS.

NOTES ON PEAS.

DURING the present season Peas have given more than ordinary trouble with many growers, from the earliest to the latest sowings. There are, of course, exceptions to this rule, as is always the case, no matter what the weather may be, for whereas some have a numerous army of garden pests to deal with others are favoured only with a few. It is singular how in one season birds will prove so very persistent in their depredations, and perhaps the following year they cause no inconvenience whatever, this being more

particularly noticed with sparrows and chaffinches. Early Peas this year proved a source of great disappointment, slugs and birds proving alike troublesome. In our case sowing and planting had to be repeated three or four times, and then the rows presented a very thin and unsatisfactory appearance, caused by the young tips being eaten off directly they showed above ground by slugs and birds, the former being more numerous than ever I can remember them before. Both these and mice have a singular partiality for some varieties of Peas, opportunities occurring for ample demonstration this year in this respect; Dr. Maclean and Duchess of Edinburgh proved victims, while *Ne Plus Ultra*, *Magnum Bonum*, and Duke of Albany escaped almost untouched. Peas, too, germinated badly, owing no doubt to the sunless season of last year proving insufficient for thoroughly ripening the seed.

Lately there has developed among the Pea rows some kind of disease, which is even worse than bird or insect attacks, as in some of the late sown nearly or quite half of the stalks have collapsed, and as a consequence the crops are becoming light. I have noticed the same thing in other gardens as well as our own, and perhaps some readers may be in a position to throw light on the subject.

Second early Peas have continued to bear over a long period, this being accounted for by the continued spell of dry summer weather followed by the frequent and abundant rains. The drought caused the growth and pod-production to cease prematurely, while the change to greater humidity gave a stimulus to new growth again—a fortunate event where later sowings are stricken with the aforementioned disease. Those who are favoured with a sufficiency of labour may be strangers to the scarcity of Peas or with disease, as when provided with abundant supplies of liquid, or even clear water, the growth is not so subject to climatic influences as they otherwise would be. All are not alike favoured with help, and to these early mulchings are of the greatest importance in conserving moisture in the soil.—W. S., *Frome*.

PHAIUS MACULATUS.

THE genus *Phaius* is not a large one, but it includes several noble species, some of which bear ample dark green leaves and erect spikes of very bold and handsome flowers. These plants, in recent times, have been too much neglected; but many years ago *Phaius Wallichii* was frequently seen at the Exhibitions at Chiswick, Regent's Park, and other places during the months of May and June. It produced a noble appearance, especially when used as a back-row plant, with its large, plaited, dark green leaves, and from ten to fifteen bold erect spikes of fine showy blooms. This species used to be so exhibited in fine condition by the late Mr. Ellis of Hoddesden, a keen lover and grower of Orchids, and also by Mr. Carson, from the famed gardens of Nonsuch Park, in Surrey, and by various others. *P. grandifolius* was another species exhibited in the same manner in the olden times, which, although not quite so showy as *P. Wallichii*, was yet a very effective plant; whilst yet more recently has been added *P. Manni*, which, when established in cultivation, will be far the finest of the three. The majority of these plants are of easy culture, and may be successfully grown in an ordinary stove with a mixed collection of plants, and if their wants are duly supplied they never fail to produce their stout spikes laden with large and showy flowers in abundance. There are some dwarf-growing kinds; one of the most beautiful, although difficult plant to manage, is *P. tuberosus*, a native of the Island of Madagascar, which was figured in the second volume of the "Album," t. 91. *P. maculatus* has been neglected, but it may yet be found in many old collections of stove plants, where it grows and blooms in great perfection. The plant here figured was introduced to cultivation about sixty-six years ago, having been brought from Northern India in 1823, and as the great aim and object of modern Orchid growers has been to secure new species, this old plant, like many others of the most beautiful Orchids, has been cast on one side for newer and, in many instances, less beautiful kinds. To all such movements, however, there usually comes resuscitation, and this appears now to be in force, for the old plants are being eagerly sought for, and amongst them *P. maculatus*.

Phaius maculatus is an evergreen, and is an extremely showy plant; in many instances it is erroneously named *Calanthe Sieboldii*, from which rare plant it is abundantly distinct. The pseudo-bulbs

are ovate, about 4 inches high, and of a peculiar shade of green; the leaves are about 2 feet in length, much plaited, the ground colour being green profusely ornamented with yellow spots. The scape is erect, from 18 inches to 2 feet in height, and towards the apex is borne a raceme of about a dozen flowers, which are of a showy yellow colour; the lip is fringed and streaked with reddish brown on the front margin. The flowers open during the spring months, and continue in beauty for a very long time.

The plant is easily grown into a good specimen, and it requires only the ordinary care bestowed upon stove plants. It enjoys an abundance of light and sunshine, yet, as its leaves are somewhat thin, it should be shaded through the hottest part of the day in summer, in order to preserve its foliage intact, for they present a very bad appearance when scorched. If the plant is grown with other Orchids it will thrive best at the cool end of the East India house or the warmest end of the Cattleya house. It is a terrestrial plant, and should be potted accordingly; the soil we have found it to thrive best in is rough fibrous peat, good turfy light loam, and sharp sand thoroughly incorporated. The drainage must be good, and should be covered with a layer of sphagnum moss to prevent the mould running into and choking it. A liberal supply of water is necessary during the growing season, which must, however, be considerably curtailed during winter, when, although much less is necessary, it should never become quite dry, or the leaves will suffer and the plant become disfigured. At the time the spikes begin to appear the supply of water may be increased, as these require strength to develop their beauty. When the blooming season is over the plant begins to renew its strength, and this is the best time to repot; if this is not necessary the upper portion of the old soil should be removed and renewed.—B. S. WILLIAMS (*in Orchid Album*).

ODONTOGLOSSUM ROSSI MAJUS.

PLANTS that have been suspended at the warmest end of the Odontoglossum house since they flowered in October last have completed their growth. At this season they are liable to start again unless they are removed to the coolest end of the house, or better still to a very cool airy position. This will retard them. They must still be liberally supplied with water and shaded from bright sunshine. We have found that no injury results from suspending them under the shade of Vines, where the ventilators are open day and night. On established plants an autumn growth is not desirable, and may with a little care be prevented. It is clear that this variety will bear without injury a very low temperature. When a succession of flowers is required over a lengthened period of time some must be pushed into growth in a warmer atmosphere than is necessary for the general stock. The only drawback to this is the liability of the plants to make a second growth. Few Orchids with which I am acquainted yield a better return for the room they occupy and the labour required in cultivation. The flowers last well in a cut state, and are suitable for any purpose, especially for furnishing small vases. All our plants are grown in small shallow pans, 5 and 6 inches in diameter, and very little more than 2 inches deep. A good layer of crocks is placed at the base, and the plants potted in peat fibre and small lumps of charcoal, with a thin layer of moss on the surface. The plants are but slightly elevated, as they require very little rooting material, but what is given them should be open and sweet. From six to twelve good flowering pseudobulbs are grown in each pan.—ORCHID GROWER.

EDIBLE FUNGI.

THERE are few matters that the general public are more deplorably ignorant about than that of fungi. While every rustic knows the Mushroom, and considers an hour's search well spent if he is rewarded with finding half a dozen, he may at the same time have passed over fifty funguses which, if he only knew to be non-poisonous, would be gladly gathered. But it is not only the rustic whose information is faulty. Among gardeners, who ought to be better informed on the subject, there is probably not one in a hundred who could gather a dish of edible fungi and have them cooked for his own dinner without grave misgivings as to results. This ought not to be. Which of us does not like a well-cooked juicy Mushroom? Which of us, this side the Tweed at all events, for it is a well-known and rather extraordinary fact that they do not take kindly to them on the north of that famous river. I have frequently been told when advocating their merits that they would be "geyan hard up afore they would eat a wheen wersh puddock stules," a remark suggestive of poor cookery. The whole fungus family require not only to be well seasoned, but to be thoroughly well cooked.

But for those who do enjoy the above-named luxury isn't it

just a little hard that we are denied entering on a more extensive field of fungology, all for want of a little information?

I have often wondered why some enterprising nurseryman did not issue a coloured plate of five or six of the best and commonest edible fungi; and a like number, and those the most closely resembling the good, of poisonous or useless varieties, as a safeguard, with names and brief description. Such a plate would be likely to hang for years in many a gardener's office or kitchen, and in many a country home—not only for annual reference, but as a perpetual advertisement of the firm who sent it out.—A. C. W.

PHYSOSIPHON LODDIGESI.

AT one of the meetings held by the Floral Committee of the Royal Horticultural Society at Chiswick this year, Mr. F. G. Tautz of Studley

FIG. 24.—PHYSOSIPHON LODDIGESI.

House, Hammersmith, showed a plant of the peculiar little Orchid represented in the woodcut (fig. 24)—namely, *Physosiphon Loddigesii*. It is not altogether devoid of attraction, as it is graceful in habit, and its slender spikes of flowers are freely produced. The generic name is

due to the swollen or bladder-like greenish flower tubes, which are surmounted by small orange-brown sepals. It thrives very well in sphagnum and peat in an intermediate temperature.

APPLICATIONS OF CLAY TO GRAVEL.

Soon after I came here I was made aware of a Government surveyor taking the dimensions or outlines of a small pond at the corner of my garden; some mistake had occurred in the previous survey, and he was there correcting it upon a section of a map. I informed him that I was a new proprietor since the local survey, and was it too late to alter the name of the place from "Folly Farm" to "Cottage Farm?" He thought not, so Cottage Farm was written, and Cottage Farm it is in the new survey. A friend and historian of the neighbourhood called upon me lately and said, "Mr. Fenn, you have altered a landmark of history by blotting out the name of 'Folly' and reinstating that of Cottage." How so? I was aware of the penalty expressed by the removal of one's "neighbour's landmark," but how the substitution of the appropriate word Cottage in lieu of Folly to my place could efface history passed my comprehension. Quoth my friend, "Folly in Roman history means a crossing place or way, and it was somewhere about here that the old Roman-way used to cross the river Rennet" (the old Silchester Roman station is about three miles from here). Well, I replied, in that case I must beg history's pardon, but why I altered the name was because I thought at the time I really had committed a folly in purchasing the hungry gravelly looking place. They twist surnames about here, and as "Folly" might merely mean a corruption of Foley, the name of old residents in the parish, I changed the name in fact to cover my chagrin. Time, however, has convinced me that I did not commit a folly, as I have succeeded in making another portion of this fair earth to blossom as the Rose. Since the above accusation of my friend I have read in "Old and New London" where mention is made of Folly Ditch, or a ford leading to Jacob's Island. Historians please inform. But the above must be allowed in a measure explanatory as leading to the application of clay, which a correspondent asks me to favour him with on page 110.

Now is the time. The grand secret of the Woodstock soil was the subsoil of clay. The top soil was worn out, giving it the appearance of mere cca-se gravel. Bastard trenching was at once resorted to, and about 3 inches of the clay hoisted on to the surface as the digging proceeded for the sun and air to act upon it at once, and afterwards the frosts of winter, then to be dug or forked in as a top spit in the spring with dung or any other manurial accumulations. The effect will be magical; at least, it was with me. When I left Woodstock "Fenn's fads" were quickly done away with; the garden was laid down to grass as a croquet ground, and Mr. W. Crump, who then resided at Blenheim Gardens, had the superintendence of the mowing of the Rectory ground. He told me, as a grievance, that he was obliged to send men to do so twice a day. Well, Mr. Crump is alive and well amongst us, I am happy to say, and if the above words to me are doubted I cannot help it.

My garden here is a more decided gravel than that at Woodstock. I had it drained and trenched, keeping the bottom down, but turned over, as the clay *in situ* is too hungry and stoney to be brought to the surface. I have capital sub-banks of pure clay in my fields; portions of this were and are periodically dug and carted and lain upon the surface for the winter frosts to split up. Manures cannot beat it for effect. Strawberries, fruit quarters, orchard trees surfaced, all become dosed, though, excepting the arable land, never dug, and the clay soon becomes amalgamated into loam. Your correspondent's subsoil is a gravel. I advise it not to be disturbed; let him haul clay at once on to the surface and cultivate as I have said in the spring. My ground is undulating; on a declining side of one of my fields strata of clay and gravel alternate; the consequence was a wet sour surface which medium drains did not correct. Drains approaching to deep ditches were dug and piped at bottom, which corrected matters, and left me clay for surfacings and to spare for burning. I place the gravel over the pipes, and a main drain empties into the river.

I borrow soil from other parts to pay the filling up. I also stifle burn a portion of clay every autumn after this fashion:—Collections of hedge trimmings, roots of trees, and other debris, which are sure to be collected by those on the look-out, and the clay hauled to the spot. On a farm it is usually not found very difficult to cut a load or two of turf sods. These are placed around to form, so to speak, a turf-walled furnace; a wood fire is started therein, and whilst this is being attended to to produce a good body of fire build up another wall of sods about 2 feet distant all round, and well packed within with prunings, and some of the larger wood, with a sprinkling of small coal or cinders. Do not hurry on the central fire by heaping on too much; make sure of a good central

body of fire, and by degrees place sods upon it, and now and again a few more, intermixing a portion of the clay. The inner circle of sods will by this time have become ignited, and will serve to retain the fire, and so communicate through to the second circle, which will follow on and maintain itself. Now pack around from base to top the larger roots, intermixed with the clay, along with a portion of small coal. Attention will be required perhaps all night, or at least till a good body of fire may be considered as secured, and then keep gradually heaping over the clay where the smoke attempts to burst forth; but never overheap too much at once, as it is then that failures are made. Perhaps it may be advisable to continually intermix some small coal where clay burning follows on upon a large scale.

Apropos of this subject, a few years ago Mr. Buckmaster came to stay with our late rector for the purpose of delivering an agricultural lecture in our school-room. Mr. Gladstone's famous advice to farmers about planting fruit trees and making jam was then fresh on the tapis, and Mr. Buckmaster laid stress upon it in his lecture. My place adjoins the glebe, and as I had known Mr. Buckmaster for some years a visit to me next morning was planned, where he found my wife's shelves well furnished with jams, the cellar stocked with cider and perry, and the fruit trees that produced them "all alive and a growing." "Why," said he, "you already have Mr. Gladstone's theory practically illustrated." "Yes," I answered, "it was in 1851 I caused to be printed in the pages of the *Cottage Gardener* much the same advice, and long before that, and ever since, I have in a great measure subsisted upon what I then recommended." (I have sixty gallons of wine now working in the barrels, and our shelves are well furnished with jams, but I shall not be able to make any cider or perry this year). "Well," Mr. Buckmaster said, "my train is due at 12.30; I should like to spend a longer time with you, but just let me advise potash for your soil." We were close to my heap of smother burning, so with a "pikle" which was standing handy I broke into the side of the heap, and out came a charred mass of charcoal wood and burnt earth. "There," I exclaimed, "that is what I apply every year, and as much as I can get of it, to my soil, and thus I do use potash." Mr. Buckmaster went. Now, if our good friend and correspondent will take my advice, and our Editor will forgive my prolixity, he may reckon upon his land with confidence, and if he feels i' the vein he may repeat the following incantation:—

"Black spirits and white,
Brown spirits and grey;
Mingle, mingle, mingle—
Ye that mingle may."

—ROBT. FENN.

STRIKING DRACÆNAS IN BOTTLES OF WATER.

THIS simple method of propagating Dracænas does not appear to be practised as much as it should be, considering it offers greater advantages and gives less trouble than any other known method of rooting large tops of these showy and useful plants. Those who have not the convenience of a propagating house have often great difficulty in finding handlights, bellglasses, or frames with bottom heat large enough to place over good sized tops of Dracænas to keep them close till rooted when inserted in pots in the usual way. But if bottles filled with water are used it is not necessary to keep the cuttings in a perfectly close atmosphere, the large amount of water which the cuttings absorb when placed in water prevents their showing the least signs of distress if in a warm moderately close house where direct sunshine does not reach them. When placed on the beds in Cucumber and Melon houses where the plants are trained overhead they root with certainty, and give but little trouble. Whenever we have plants that have become too tall, we cut off the tops to the required length, leaving a couple of inches of stem below the leaves, place them in bottles which have been previously filled with water and a few pieces of charcoal added, the bottles are then stood in positions above indicated as being suitable. The only attention they require till rooted is to keep the bottles filled with water, the tops being syringed when the other occupants of the house require that attention. When the roots are a couple of inches long the tops should be placed into small pots, and in the same positions that they occupied before being potted, till the roots are found to be working freely into the soil, when they may receive the same treatment as the ordinary stock.—H. DUNKIN.

CANKER IN FRUIT TREES.

IF "W." (page 108) thinks I am only writing for the sake of "making a point," he is certainly mistaken, and whether he believes me or not, I am tired of this subject. At the same time, for the sake of fruit growers in general who do not entertain my views, I think it only my duty to put such information before them that I can with a view to getting rid of the old notions that have been drilled into us from childhood, and which I claim were upset upon the principle that insect life is at the bottom, or primary cause, of canker in fruit trees. I have no "razors" to sell, no pages to fill, or books to sell, therefore I have no interest in continuing writing for the sake of writing; but, on the other

hand, having taken up the subject as a hobby, it has cost me a considerable amount to be in a position to feel confident that I have mastered the principle by observation and experiments.

Our friend "W." is an old hand at writing, and I acknowledge his superiority. To follow his note in p. 108 probably would necessitate a lengthy reply and the use of a good many quotation commas, which I am in no mood for; at the same time I am as far as ever—even further—off throwing up the sponge or fighting my "insect theory." "W." seems very anxious to draw out a reply as to wounds healing while "insects are as busy as ever in their destructive work." I have no recollection of making such an assertion, but this I know, that wounds do sometimes heal up and cause lumps on the branches, even as big as one's fist. As to Mr. Tonks's garden and trees, and his "millions of insects," I know nothing of them, and as I like to "prove all things," I am not prepared to hazard another guess as in the case which "W." draws such consolation from, "the sorts they like best." If I prove by experiments that we have nothing to fear as to planting certain sorts of Apples that are said to be "subject to canker" if kept free from insect life, surely there is nothing for me to be "dissatisfied" with, but exactly the opposite.

Well, now as to Impney. I have made it my business to follow "W.'s" advice, and by the kind permission and assistance of Mr. Parker, have examined the tree from which the specimen was cut that was engraved a short time ago. It cost me about 6s. out of pocket, a good drenching, a cold, and the loss of half a day in my garden, and, will readers actually believe it? I found the identical insects in the tree, within a few inches of where "W." cut his specimen, which I have never yet failed to find on specimens at the commencement of a canker spot. My visit was a most unfortunate one, as at the time everything was drenched with rain, and a bad light. Mr. Parker next showed me an Apple tree, the trunk of which was about half eaten with an old canker wound, or wounds, for there were two; these had been dressed, he informed me, with petroleum—mark that, a kill-or-cure insecticide—and these were healing most satisfactorily, a plaster of cowdung and clay hastening the cure by keeping the place moist, and the bark fast swelling towards the closing wound. What about Jack Frost and the unripe wood theory? thought I, on that old wood.

I was next shown a Ribston Pippin pyramid. I thought Mr. Parker seemed a little reluctant to even refer to its pitiable state, and he soon informed me it was condemned to be rooted up. I took off, by permission, a piece of the dying wood, and found that the bark was entirely killed round it in places, and on close examination I soon detected at least half a dozen species of insects and grubs hard on—of course not "causing" canker, but simply there in "consequence" of canker—according to "W." and Mr. Tonks, and among the list the inevitable little rascal so often referred to. Now, that tree offers an excellent opportunity for Mr. Parker to experiment upon, instead of rooting up, I have no more doubt about curing that tree on the insect theory than I have that the sun will rise to-morrow morning. So much for canker at Impney, except lastly, that I was greatly obliged to Mr. Parker for his kindness and the frank manner in which he gave me information, although he had the courage—which I am sure I esteemed, and no joking—to tell me that he did not agree with me. The crops of fruit were excellent, far surpassing anything seen this season.

Since writing the first portion of my note I have read with much pleasure Mr. Tonks's letter on page 128. I was passing through Birmingham to Liverpool, and seeing the Journal on the bookstall invested in 3d. worth, and soon found the article, and conned it over, resolving at the same time that if opportunity presented itself a run over to Knowle would be the result. On my way back, having in the meantime tramped the Isle of Man until I was blistered and footsore, I resolved to "prove all things," and accordingly made my way to Knowle, and Oh! "W.," if you could have seen me trying to endure, being tired of walking, steam-boating, railway travelling, for I had started from the Isle of Man that morning as well as writing. Although if you do not believe me, you would have pitied me certainly; and, like the journey to Impney, the very elements seemed as contrary as my friend in controversy. It commenced pouring with rain, but, nothing daunted, Mr. Tonks seemed as indifferent to wet as a duck in a pond, and I had to follow him in the garden. The first thing to which my attention was called was as we passed through the conservatory, in the matter of plants having a shrivelled-up appearance, as if scorched. Asked if I could account for it I examined the foliage, and on the under side of the leaves I discovered innumerable insects of a new description to me, so far as a very short inspection permitted. These were treated by our friend Mr. Tonks with a "pooh pooh." All up, thought I, if that's the way canker is to be passed over among the fruit trees; and so I found it on close examination, for there sure enough were the identical little vermin. Oh! I must not "s'ander" them—the little innocents, which "W." led me to suppose had all disappeared. Well, joking aside, I cut off portions of the freshest cankered wood, and inspected them in the "Grange," and placed the insects, which I have so frequently referred to, under Mr. Tonks's microscope. My impression is that Mr. Tonks will not let it enter into his head that they are the cause, but the effect of canker, and I felt somewhat of shame to have the appearance of dictator. Now, the question must naturally arise, Where do these insects come from to invariably occupy cankered places if they are not the cause? Are we to believe in spontaneous generation of this particular insect? Or may we believe that they are as destructive in their particular sphere as aphides, red spider (and I believe they are a species of this family), thrips, American blight, or other well-

recognised enemies in horticulture? 1s. 9d. railway fare, a soaking, and the afternoon lost, to clear up the Knowle mystery.

"W." informs us, I believe, that he has a Hawthornden Apple tree that is badly cankered. Now, will he be kind enough to send me a fair specimen of the most recent attack for examination? As "W." prefers to keep his name a "dark un" I cannot ask him personally, and our friend Mr. Parker is equally guarded as to our mutual friend's name. He says he is "open to conviction," but I am afraid there is not sufficient ink in the bottle to do it in writing.

We have been introduced in writing to Dr. Hogg's trees—the Dumcallow's Seedlings. Would it be asking too much to request that a specimen or two be forwarded from these trees? I have no doubt about finding the identical insects in every case, or on every tree of fresh cankered wood in the kingdom.—J. HIAM, *Astwood Bank, Worcestershire.*

NOTES ON SOME NEW ROSES.

THE following are a few notes on some of the newer Roses as seen this season:—

HYBRID PERPETUALS.

Earl Dufferin.—This has disappointed me considerably. I saw no blooms last season, and all those on my own plants (cut-backs and maidens), and elsewhere that I have come across this year, have appeared dull in colour and ragged in outline; but I have no doubt it is sometimes bright and good, as so many good judges say so. My blooms were very late, and perhaps felt the change of weather. It seemed to come rather in the manner of Marie Rady, which we know is brilliant and glorious after a fortnight of fine weather; but the most miserable, dull, dirty thing ever seen if it be wet and cold.

Germaine Caillot.—I saw two good blooms of this. It is a very useful shape, the outer petals falling well down of their own accord from a good full ball in the centre; something the form, though longer in petal, of Violet Bouyer. I have heard this shape justly admired because "it makes the bloom look bigger than it really is."

Lady Helen Stewart.—Seems a useful Rose, very bright and telling, catching the eye at once, and a good grower.

Madame Montet.—This is not a new Rose, but has been effectually shown several times this year. It has large petals, which will atone for many defects if you can get it to stand, for it is certainly thin.

Mr. James Brownlow.—A seedling of Messrs. Dickson, is a cross between Paul Neyron and Marquise de Castellane, and one naturally fears it may be coarse. I have had one bloom, which came on a weak shoot, and had been bitten by a grub. There is no doubt of its being a large Rose, but I cannot say whether the shape will be regular and well defined. It is a great grower, and I am afraid seems inclined to "favour its pa" too much.

Sir Rowland Hill.—Certainly a beautiful and most effective colour; in other respects it seems just like Charles Lefebvre, and should be a great acquisition. My blooms have not stood very well, but it has been finely shown.

TEAS.

Cleopatra.—I have seen a very small bloom of this new seedling of Mr. Bennett's, which seemed promising.

Ernest Metz.—This Rose seems very changeable in colour, opening something like Jules Finger, and turning into, not the livid hue of that Rose (which is so objectionable), but a much paler tint, which I cannot describe. It seems to require a special education to write down accurately the separate shades of some of the Tea Roses, and he is a clever catalogue compiler who can please everyone. A good grower, and apparently quite a good Rose, large and well shaped.

Ethel Brownlow.—Very little shown this year. I do not know how this was. I did not get a bloom of any size, but it certainly is a charming shape.

Madame Hoste.—This also disappointed me, as the petals seemed thinner than I expected; but there are plenty of them, the blooms are large and capitally formed, and for a thinnish Rose it appears to be a very good one.

Mrs. James Wilson.—A new Rose of Messrs. Dickson. I have had one bloom, decidedly promising. One cannot judge well from a grafted plant, but it seems to be something in the way of Princess Beatrice, but more tinged with rose on the outer petals.

Princess Beatrice.—I have not been lucky with this, and have not seen it well shown. It is a good grower, and appears to be an early sort, that will be good with care and high cultivation.

Souvenir de S. A. Prince.—I believe this is a grand Rose. I have had two famous blooms, quite worthy to be shown in any twelve, off a tiny grafted plant. It seems quite as good a grower as Souvenir d'un Ami, from which it sported. Not so long in petal as Niphetos, but probably as large, because broader, and maintaining its shape when the outer petals fall; quite as pure in colour, but stouter, more solid, more lasting.

Of older Roses, the best of the year with me were, among H.P.'s, Marie Baumann, Madame Crapelet, and John Stuart Mill, these being better than ever before; and among Teas Princess of Wales especially and Madame Angèle Jacquier.—W. R. RAILLEM.

IRON FOR ROSES.

"DISAPPOINTED" quotes me as saying that iron is essential for the production of good Roses. I do not remember my use of the expression; but as iron is essential to the existence of every growing plant, good Roses cannot be produced without it. Other elements, however, are equally essential. I recommended a manure for Roses containing nitrogen, potash, phosphorus, magnesia, iron, and gypsum. The proportion of iron is small, only one thirty-third part of the whole, in the form of the sulphate. Why should "Disappointed" wish to substitute the oxide (there are several oxides of iron, to which does he refer?) If it is cheap, so is the sulphate, popularly known as green vitriol. All the recorded experiments within my knowledge, relating to the application of iron in the successful cultivation of the Rose were made with the sulphate; therefore I recommend "Disappointed" to use that salt, but on no account to omit the other elements of the manure suggested by me, if he wishes to grow good Roses. The application had better be made as a top-dressing immediately after the spring pruning.—EDMUND TONKS.

THE LONDON PARKS.

HAMPTON COURT.

THOUGH at some distance from the metropolitan district in which most of the other public parks are situated described under the above heading, yet Hampton Court is so easily reached by rail, and the journey is such a pleasant one, that few horticulturists who come to town with the object of inspecting such establishments omit this one from their tour, more particularly as the reputation it has gained under Mr. Graham's management has ranked it amongst the best kept places of its kind. The most direct way of reaching it is to travel from Waterloo to Hampton Court *via* Wimbledon, the station being at Moulsey, on the Surrey side, but within a few minutes' walk of the Palace and gardens. Another route, and a very agreeable one, is to journey on the Thames Valley branch to Teddington Station, walking thence through Bushey Park to the gardens, which are reached in twenty minutes or half an hour. The grand avenue of Horse Chestnuts is always beautiful in the summer months, though it attracts the greatest number of visitors when the trees are in flower, and "Chestnut Sunday" has become quite a recognised holiday for Londoners. There is still a third way of travelling to Hampton Court, but that is only available when the visitor has plenty of time at his disposal, as several hours are occupied in the journey from London Bridge, and there is only one boat a day, which starts shortly after 10 A.M. This can only be recommended when the weather is fine, but then it is a most enjoyable trip as the Thames scenery, equally from Kew to Kingston and beyond, is charming in the extreme.

Hampton Court Gardens have, apart from their antiquity and varied interest, acquired a considerable reputation for the superior manner in which the "bedding" is carried out. Carpet beds in particular have been made a special feature. But far from relying exclusively upon these, every effort has been made to introduce as much variety as possible, and considerable success has attended the experiments in this direction. Mixed beds of the character frequently recommended in these pages and described at other parks have been freely employed with good results. The long border by the Palace has also been utilised for a collection of the most effective hardy plants, which render it attractive from early spring to late autumn, the plants employed having been carefully selected with that object in view. No garden is complete without a border of this kind, and old gardens like the one under notice are above all most suitable for old plants and border favourites.

In turning to the carpet beds it may be observed that in nearly all *Echeveria secunda glauca*, with *Sedum hispanicum* var. *glaucum*, constitute the edging, the exceptions to this being where plants with similar coloured foliage form the groundwork, and then *Mentha* and the Golden *Stellaria* are employed in their stead. Taking these beds in order from the northern end of the gardens the first contains an edging of *Echeveria* and *Sedum glaucum*, inside which is *Alternanthera amœna*, followed by Golden Feather and *Mentha pulegium gibraltarica*, with panels of *Veronica candida* and *Alternanthera paronychioides*, all well disposed on a general groundwork of *Mentha*. No. 3 had a groundwork of *Mesembryanthemum cordifolium variegatum*, with a centre of *Alternanthera amœna*; on either side of this were arranged a Maltese cross, the one having *Echeveria Peacocki*, and the other *Sempervivum montanum*, both being outlined with *Echeveria secunda glauca*; there were also squares of *Leucophyton Browni*, and small circular panels of *Alternanthera versicolor*, while the rich and varying tints of other *Alternantheras* came out in a telling manner against the *Mesembryanthemums*. In carpet bed No. 4 an agreeable change has been introduced in the form of small Palms, *Pandanus Veitchi*, *Dracœna rubra*, the principal groundwork being composed of *Alternanthera amabilis* at either end, and *A. paronychioides* across the centre, the remainder being made up of small *Latanias*, set in a groundwork of *Mentha* and *Sedum glaucum*; there were also small plots of *Pellœa muscosa* and *Herniaria glabra*, in company with *Pachyphytum bracteatum* and *Cotyledon Schapflyus*. No. 5 was perhaps a little perplexing, and although partaking more of carpet designs than the majority was devoid of that decision which is characteristic in these gardens. No. 6

had *Echeverias* and *Sedums*, with *Herniaria glabra* next, while at each end were large circles of *Herniaria* and *Alternanthera paronychioides aurca* and *amabilis*, edged with *Echeveria Peacocki*, and having a central plant of *Echeveria metallica*, the remainder of the bed being barred with *Alternantheras* and *Leucophyton Browni*. In No. 7 *Veronica candida* predominated; this, in company with the golden forms of *Alternanthera paronychioides aurea* and major, constituting the leading plants employed. No. 8 had an edging of *Sedum* and *Echeveria*, with general groundwork of *Mesembryanthemum*, the centre being formed of *Echeveria Peacocki* and a single plant of a species of *Aloe*, while at the two ends are lyrc-shaped designs composed of *Leucophyton* and *Alternanthera*.

Apart from the carpet beds some were conspicuous for other plants. For example, one large bed had a broad band of Golden *Stellaria* for a margin, and next to this a still broader band of *Iresine Lindeni*, following which were silver and gold *Pelargoniums* and central blocks of *Coleuses*, with just enough *Viola Blue Bell*. This was an effective bed. Several other beds partook of the same character with slight variations. One bed had *Ficus elastica*, with *Ageratum* and *Dactylis elegantissima* beneath; another bed was conspicuous with scarlet *Phloxes*, *Souvenir de la Malmaison* Rose, and *Stocks*; and a bed of standard Roses had a delightfully fragrant companion in *Heliotrope President Garfield*. Scores of other beds were filled with *Pelargoniums*, while some had *Cannas*, scarlet *Gladioli*, and hybrid *Pentstemons*. Promising well for a future display was a large bed devoted to *Chrysanthemum Madame C. Desgrange*, margined with *Aster Amellus bessarabicus*. These two plants are of uniform height and flower at about the same time, and afford an illustration of what may be accomplished with good hardy perennials.

NOTES FROM A HERTS GARDEN.

PEACHES AND NECTARINES.

CROPS of these fruits this season have been or are very tantalising. The blossoms were abundant and strong, the "set" was good, and the fruit took the first swelling and continued it up to the size of Walnuts in capital style; then it, or most part, became and remained stationary, or nearly so, for several days, when it suddenly and unaccountably collapsed—shrivelling and falling in showers. These are some of the delights of gardening. We were anticipating (and appearances justified the forecast) a fuller and finer crop of fruit than usual. We had begun to calculate the time and manner of feeding directly the stoning was sufficiently advanced, and discerned in prospective dishes teeming with high-coloured, luscious fruit. Outdoor fruits, particularly Apricots, Peaches, Nectarines, and Figs were thin—next to nil, and Pears promised to add little, scarcely sufficient to give variety to desserts. Multiplying dishes of Grapes or Melons are poor apologies for variety; indeed, it only makes the want of the absentees felt more keenly, and prompts inquiry. The remainder of the Peaches fortunately were fine, but the Nectarines finer. Further, the Peaches were thinner than the Nectarines, yet they did not finish so satisfactorily. These remarks apply to the early houses, as the result as regards the finish is not determined in the later heated ones, yet there is every prospect of a similar issue. The trees in all instances made no attempt at stoning; the fruit alike in the early and late houses swelled only to the size of Walnuts, and then fell in quantity. The crop before stoning was not remarkably heavy, and after dropping it was not more than one-third of what the trees were capable or considered competent to carry. A notable characteristic was that the trees cast the fruits almost totally from the upper part where the wood is strongest, the lower part of the trees retaining the greater part of their crops. It may be further noted that the large flowered varieties cast more fruits than the small flowered, and that the Nectarines shed less fruit than the Peaches. I may further reiterate the fact that the Nectarines finished much better than the Peaches; indeed the Nectarines, particularly that very fine early variety, Lord Napier, some of the fruit of which rivalled the early Peaches or Hale's Early in size, were superlative. Finally, some of the fruit split at the stone, and in every instance was confined to the large flowered and large fruited varieties only; in fact the larger the fruit the greater danger of its being spoiled by stone-splitting.

Such are the facts, and my object in troubling you, Mr. Editor, is to elicit, if these lines are thought worthy of a place in "our Journal," the views of others upon the matter named. My views are that the casting of the fruit before stoning was a result of the cold, sunless, and wet weather of 1888, the wood not being solidified as made, the sap imperfectly elaborated, and the matter stored in the wood and buds inadequate to the maintenance of the fruit in its early stages. The wood, in brief, was not sufficiently ripened, in which view I consider proof conclusive in that of the fruit not being cast on the wood at the lower part of the tree or trellis, where the growth from position alone was less strong than at the upper part, and of necessity having less sap, would under the disadvantageous laboratory conditions of the season attain to a great extent of assimilation, ripening of the wood, and perfection of the buds, than growths much stronger. This is my view of the case—viz., grossness or a tendency that way is in the direction of unfruitfulness, and to that cause exclusively we attribute the casting of the incipient fruits. The grossness intended is not that known as characteristic of sterility, but that of ordinary growth in consequence of the unfavourable climatic conditions insufficiently hardened and stored with assimilated material. Of course those having full crops will attribute the disaster to errors of culture, alleging that a little

warmth in the pipes before and after the crops were gathered with sufficient ventilation to cause evaporation, would have insured the requisite elaboration of the sap, the solidification and ripening of the wood and buds. Such are fortunate, and can take as much credit as they like to themselves without anybody being the wiser, but what we want to have is information from those that have experienced similar disaster, and the way they have managed to hobble safely out of the difficulty on to safe and certain ground. My deductions are that the fruit on the lower part of the tree were a consequence of the greater evaporation through proximity to the hot-water pipes, combined with the lessened vigour, and that had enough air been given with a diminished amount of atmospheric moisture in the structure all would have been well with the upper as well as the lower part of the tree. This points to the necessity of a free circulation of air in the early stages of forcing, in order to have short jointed sturdy growth, well developed stout textured foliage, the growths thoroughly solidified as made through the perfect elaboration and assimilation of the sap, which is the best of safeguards against insect pests and fungoid growths, and the only growth on which reliance can be placed for the ensuing crop. The trees in an unheated house singularly enough have retained the fruit equally on the upper and lower parts of the trees, and here the ventilation was free from the commencement and right away to the fruit taking the last swelling for ripening, when encouragement was given by a moderation of the ventilation and by early closing, so as to assist the ripening, and the growths being thinner and the moisture less the wood was more evenly ripened. Why have the trees in the unheated houses not cast their fruit equally with those in the heated structures? and why should the apparently less ripened wood of the unheated house trees retain the fruit whilst that of the apparently much better ripened heated house trees were throwing it off? Surely the confined atmosphere to which early forced trees are subjected in a cold sunless season is contrary to Nature's requirements, the solidification of the growths (and the formation or character of the buds given) as made, and which no after treatment can change.—UTILITARIAN.

THE WEATHER.—Until the present week showers were of daily occurrence in the metropolitan district, and, indeed, appear to have been general, occasionally accompanied with high winds, which denuded many trees of fruit. Bright and calm weather has succeeded, and it is hoped will continue for the in-gathering of the harvest and the well-being of fruit trees.

— WE are requested to state that the BEDFORD AND BEDFORDSHIRE CHRYSANTHEMUM SOCIETY'S SHOW is fixed to be held on November 21st and 22nd.

— A NEW CHERRY.—In your report of the fruit department of the Taunton Deane Horticultural Society on page 162, mention is made of a new Cherry shown by Mr. R. Nicholls, gardener to Earl Fortescue, Castle Hill, South Molton, Devon. It is well described by the writer as "a large form of Black Tartarian," equal in point of quality and larger in size. In addition to Morellos, the only other Cherries shown were Governor Wood and Florence, but they bore no comparison to the new variety. It is named Castle Hill Seedling, and came as an accidental seedling at Castle Hill Gardens. It was cared for, and Mr. Nicholls has a tree of it upon an east wall, where it does well. It is an object of special interest to Earl Fortescue, and the fruit is much appreciated by him. The tree is hardy, and it always crops well. It would prove very useful for purposes of comparison if Mr. Nicholls could send a dish of fruit to a meeting of the Fruit Committee of the Royal Horticultural Society. It is perhaps too late to do it this season, but the Committee should see it another year. If sufficiently distinct from existing sorts, it is a very valuable late variety.—R. D.

— FLOWER SHOW AT THE POET LAUREATE'S.—The annual Exhibition of fruits, vegetables, and flowers in connection with the Freshwater and Yarmouth Horticultural Society, was held on Wednesday and Thursday last, in the beautiful grounds of Farringford Park, by kind permission of Lord Tennyson, the Poet Laureate. The weather was exceedingly unfavourable on the opening day, and as a consequence but few visitors attended. On Thursday, however, there was a more numerous attendance. The Exhibition was held in two large marquees near the Poet's residence. There was a good show of fruit and flowers for competition, in addition to which some lovely floral specimens were exhibited by Lord Tennyson, Mr. E. Granville Ward, J.P., Mr. H.

Somers-Cocks, Mrs. Martin (of Chislehurst), and Colonel Crozier, J.P. Some fine samples of honey were also exhibited, and Mr. W. R. Marshall showed an interesting observatory hive.

— SOME REMARKABLE ONIONS.—On the occasion of the annual Exhibition of the Basingstoke Horticultural Society on August 20th, some Onions, remarkable for their great size and handsome appearance, were shown by Mr. Noah Kneller of Malshanger Park Gardens, Basingstoke. The variety is Ailsa Craig, raised at Culzean Castle, Maybole, and the twelve bulbs shown averaged $2\frac{1}{2}$ lbs. each, or 30 lbs. weight the twelve. In 1888 Mr. David Murray, the raiser, grew one bulb to the weight of 2 lbs. 7 ozs., and twenty-four bulbs weighed 46 lbs. 12 ozs. It is needless to add that Mr. Kneller's Onions were by far the best in the class for twelve Onions. Mr. H. Deverill of Banbury, who is putting this new Onion into commerce, added a special prize of one sovereign to the sum named in the schedule by way of commemorating the event. It is matter for regret that the mildew is making great havoc with the Onion seed now in course of ripening, and this complaint appears to come from all the Onion growing districts, Bedford especially. It is all the more to be regretted, as there was a scarcity of good bulbs last year for planting out for seed purposes.

— SUCCESSFUL BEDS OF MUSHROOMS.—This would appear to be an appropriate heading to what follows:—Looking in at Mr. Oliver's pretty garden recently, Waltham Lodge, Goldhawk Road, Hammersmith, we noted two beds, one outdoors, one indoors, the latter in a dark cellar. They were spawned on July 27th, that indoors being the more forward, and were beginning to button on August 26th—the day of our visit, scarcely a calendar month. A piece of good work this, on which Mr. Eimes, the courteous gardener, may be congratulated. He attributes his success chiefly to sweet manure. At the same garden we noted an innovation, this being an arbour of Vegetable Marrows! Trained in this way, some 6 feet in height, their pendent fruits had a novel and pretty effect.—B.

— TAKING all things into consideration, PINE APPLE NECTARINE is, in my opinion, the finest of all Nectarines. Under good cultivation it attains a large size, is of excellent flavour, and when possessing that rich orange colour suffused with crimson which is peculiar to the variety it is not easily surpassed in appearance. Some cultivators experience great difficulty in producing examples that answer to the above description, as it is often met with slightly shrivelled on the top of the fruit before the base is thoroughly ripe, and the whole appearance of the fruit being spoilt by rusty brown spots over the greater part of the surface. This is caused by exposing the fruits to too much sunshine, in conjunction with the shoots being trained too close to the glass. When the trees are trained about 15 or 18 inches from the glass, a thin coating of whitewash should be syringed over the roof as soon as colouring commences. Should the weather prove very bright another sprinkling ought to be given when the fruits are nearly ripe; then if other cultural details are properly attended to, specimens of fine appearance as well as quality will be produced. When there is sufficient room to train Nectarines of this variety from 2 feet 6 inches to 3 feet from the glass the fruits will colour splendidly without shading.—H. DUNKIN.

— A CYCLONE IN SHROPSHIRE.—North Shropshire was on Thursday, the 23rd inst., visited by a perfect cyclone—a phenomenon hitherto unheard of in England. Incalculable damage has been done to property and crops for miles around. Without any warning the cyclone came on with a great roar, which for the time drowned all ordinary sounds as if it were the rush of a mighty body of water. An intense feeling of terror was created. This deafening sound lasted about five minutes, and in that short space of time trees were uprooted and stripped of their branches, haystacks were bodily displaced, houses were partially unroofed, and barns and outbuildings were demolished. The cyclone appears to have been first felt at Mr. Sherwood's of Waterloo, where a number of Plum and other trees were uprooted. It then went over the canal, past Bostock Hall on to Whixall Hall, which suffered most. A part of a large Beech tree was carried 150 yards, crashing up against the strong walls of the Hall. Orchards, gardens, cornfields, and the lands around the Hall suffered considerably. The cyclone took a westerly course, about three and a half miles in length and 150 yards in width, expending itself at Tilstock Park, four miles from Whitechurch. All who witnessed it say it first appeared like a great white mass of vapour.

— THE annual Horticultural Show in connection with the RYDE EXHIBITION AND HORTICULTURAL ASSOCIATION was held on Thurs-

day, August 22nd, in the picturesque grounds of the Isle of Wight College, Apley, near Ryde. The Chairman of the Committee is Mr. Davey, who, with Messrs. D. Fowler, Cooke, Green, Butcher, Eldridge, J. V. Brook, and Mr. James Eley (Secretary), did yeoman service. The Show was an extremely good one, the exhibits being choice and numerous. Owing to the unsettled state of the weather there was a perceptible falling off of visitors. There were no fewer than ninety-four classes of exhibits. The following were the principal prizetakers:—Flowers.—Mr. H. Grose Smith, The Priory, St. Helens (gardener, J. Earl); Mrs. Edgar Ratcliffe, Ryde (gardener, J. Attrill); Colonel Atherley, Shanklin (gardener, J. A. Ventin); Mr. James Woods, Ryde (gardener, H. Quinton); Mr. J. J. Linnington, Belle Mead, Newport; Sir H. Daly, Ryde House, Ryde (gardener, G. Caffin). Vegetables and fruit.—Colonel Atherley, Shanklin; Mr. A. A. Carre, Apley Rise (gardener, G. Burden); Mr. J. Woods, Ryde; Mrs. E. Ratcliffe, Ryde; Mr. T. L. Winthrop, Ryde; Mr. C. Taplin, Ryde; Mr. C. Simmonds, Brading. Mr. Orchard, Bembridge Hotel, exhibited a magnificent table of vegetables (not for competition), Turnips, Carrots, Onions, Beet, and Potatoes grown on the reclaimed land at Bembridge. After the Show this capacious table-full was presented to the infirmary by Mr. Orchard.

— AT a meeting of the Council of the ROYAL CALEDONIAN HORTICULTURAL SOCIETY, held on the 7th August, 1889, it was resolved to hold a SPECIAL EXHIBITION AND CONFERENCE ON PLUMS, in connection with the Society's Autumn Show, in the Waverley Market, Edinburgh, on the 11th and 12th September, 1889. While collections of Plums are solicited from all parts, for comparison and instruction, the chief object of the Conference is to utilise the favourable opportunity presented this season by the fine crop of Plums in Scotland, for gaining useful information about them, comparing their merits, and correcting their nomenclature. All who are interested in the growing of Plums are therefore invited to send as complete a collection as possible of the varieties (ripe or unripe) grown in their district; and as the object is solely educational, there will be no competition and no prizes. It is not necessary that the fruit should be grown by the sender; but those sending collections from a district should specify the place where each sample has been grown. No limit will be put as to the number of varieties which any contributor desires to send; but the number of fruits of each variety should be from three to six, according to circumstances. The Council are anxious to procure a complete representation and record of the varieties of Plums grown in Scotland; therefore each variety should be distinctly labelled with the name, or names, under which it is known in the locality, and each collection should be accompanied by all the information possible about the climate, altitude, exposure, soil, methods of cultivation, and other particulars, which will be of much value to the Committee in drawing up their report. For this purpose forms will be supplied to all growers on application to the Secretary. The specimens being strictly for examination and instruction, they must necessarily be at the disposal of the Council. In the case of a new or unknown variety, specimens of the fruit should be accompanied by a bearing branch, with fruit and foliage, to show its character and bearing qualities. Intending exhibitors must give notice to the Secretary or Assistant Secretary, in writing, not later than Wednesday, 4th September, stating the number of varieties they intend to exhibit, for which space will be allotted and plates provided by the Society. The Council will pay the carriage of any Plums sent to the Exhibition and Conference, and will also see that they are carefully staged for the inspection of the Committee; but they will not be held responsible for any error, damage, or loss of fruit consigned to them, although all possible care will be taken of it. Collections of Plums sent by rail, or otherwise, must be addressed to Mr. William Young, Assistant Secretary, 18, Waverley Market, Edinburgh, and forwarded so as to be delivered not later than Monday, 9th September. Exhibitors staging their own fruit will do so on the morning of Wednesday, 11th September; and all must be staged and the Hall cleared for the Committee by ten o'clock that morning.—MALCOLM DUNN, *Convener of the Committee*.

KETTON HALL GARDENS.

KETTON HALL is a familiar name in the gardening world from its frequent mention in reports of fruit exhibitions and the many prizes that are awarded to the produce grown by Mr. W. H. Divers, chiefly Peaches and Nectarines. J. T. Hopwood, Esq., the owner of the splendid houses and trees, evidently takes great interest in his gardens, and estate generally. This he acquired by purchase a few years ago, and erected thereon a handsome and commodious mansion of Ketton stone, which from time immemorial has been famed for its free working and durability. One or two glass structures were found in the gardens attached to the old hall, and these still remain. The Vines in them

have been greatly improved and bear useful Grapes, with almost certainly better to follow. But Ketton, in gardeners' parlance, is not a "Grape place," and in truth few lovers of the princely fruit can inspect the fine Peach houses without feeling a wish to see also one or two vineries as worthy companions thereto. With the Peach houses, trees, and fruit the most exacting must be satisfied that Mr. Hopwood has done wonders, and what his gardener has done his opponents at such shows as the Crystal Palace, Regent's Park, Liverpool, Leicester, York, Brighton, Edinburgh and others, have in remembrance. Eighty-seven prizes won in the best competition during the past four and a half years is a very good record, especially as by far the greater number were firsts, and there is not a gardener in the kingdom who bears his honours more meekly than does Mr. Divers. He is a thorough gardener, whose ability is equal to his devotedness to his work, and whose attention to the various details, each small in itself, but in the aggregate of great moment, has enabled him to achieve a great deal more than local fame.

No finer Peaches and Nectarines are grown in the kingdom than at Ketton, and in few gardens is their culture equalled; but it must be said in few if any are such houses provided, one of these being, so far as I know, the finest peachery in England. It is a curvilinear structure, substantially built, of iron chiefly, and rests on low walls faced with dressed stone. It is glazed, as are the other new structures, on the Rendle system, and in every respect answers its purpose well. This noble Peach house, of which the small engraving from a photograph, fig. 25, represents fairly well, is 258 feet long, 28½ feet wide, and 17 feet high. It is known as the Carlsbad house, I think because it was erected as a surprise for Mrs. Hopwood on her return from a sojourn at the health resort whose name it bears. The trained trees are planted about 3 feet from the sides, or whatever the exact distance may be ample room is afforded between the trellis and the glass for working purposes. The trellis reaches to what may be termed the shoulder of the curve on each side; thus light falls directly from the top of the house over the central path and to a sufficient extent over the side borders for fruit trees in pots. These consist of Peaches, Nectarines, Plums, Pears, and Apples, and as they bear good crops of excellent fruit the avenue thus formed is highly interesting, and enables a great number of varieties to be grown and tested.

The trained trees are as fine as trees can be, and produce fruit as large and good as trees can bear. The growth would almost frighten some "hardwooded" men by its vigour. Small firm wood is their ideal, but Mr. Divers knows very well that such fruit as he gathers could not be perfected on small twiggy shoots, no matter how hard they may be. He likes them strong, but then—and here rests one of the secrets of success—he trains them thinly. The leaves do not spoil each other by crushing and crowding, but have space for free development, and then, with generous support at the roots, become strengtheners of the tree and storers of fruit-producing matter. But though the growth is strong it is short-jointed and firm, because of the light to which all the leaves are exposed, their freedom from insects, and the firm and shallow well drained borders in which the roots are working. When we find such trees as these so large, so full of vigour, and bearing such splendid fruit in a depth of 18 inches of soil, what folly it is to have borders as deep again and as light again, as many are, in which the trees are not, nor cannot be, half so good. But the soil may be considered to be of extraordinary quality. It is not. The natural soil of the district is by no means of the highest order of fertility, and is far from equalling the best in many agricultural districts. It is not bad soil, but has to be made better by good treatment before good crops of vegetables and roots can be grown in garden or field.

It is of very little use describing gardens and praising everything that is found good in them without gaining and imparting such information as can be gathered from an inspection of successful work. Success in Peach growing depends on good management on the lines above indicated, and no soil, no matter how good it may be, even to its containing the exact constituents as determined by analysis, can give anything approaching the best results if other important points of culture be overlooked. Train in the growing shoots an inch or two apart, thus huddling the leaves together as if they were of no value; let red spider have its fling; let the borders be so deep and light that boards must be used for stepping on to prevent the feet sinking in, then the precious and scientifically compounded soil avails little, and far better results may be attained with soil from a Potato field when the other cultural requisites suggested are provided.

May I leave Ketton for a moment or two for an illustration of the soundness of the routine I am endeavouring to enforce? A few hours before writing these lines I was at Chiswick. Last autumn or winter, or this spring (I forget which), Mr. Barron planted a number of young Peach trees against the back wall of a long lean-to house. He had no turfy loam, and apparently did not trouble about that. He knew the soil in the garden grew good hardy fruit and vegetables, and simply had the quantity required for the Peach trees wheeled from where it was most handy and could be best spared from the garden, mixing a few crushed bones with it. I have examined the trees to-day, and been on the border. It resembles an asphalt path in firmness and smoothness. Not being quite a featherweight, I can venture to say there is not a man who reads these lines who by stamping and jumping on that border could make any material impression in it. And what about the trees? The wood is not weak and hard, like wire, but stout and short-jointed; the branches thinly disposed; the leaves fully expanded, deep green, thick in texture, clean. The border cost a mere trifle, yet if the cultivator minds, and he generally does "mind" when he has a chance

of accomplishing an object, he will have a good crop of excellent Peaches and Nectarines next year.

I now go back to Ketton. There is another span-roofed Peach house there, small in comparison with the other, for it is only 102 feet long, 22½ feet wide, and 13 feet high, but built and glazed in the same way. Every inch of trellis on both sides, from base to apex, is covered with trees, such as anyone may be proud to own. In training, health, and cleanliness no fault can be found with them, and it follows that they bear the finest of fruit. What that means I will state by-and-by. There is yet another Peach range to be noticed; this time a lean-to, 186 feet long, 11½ feet wide, and 13 feet high, glazed like the others. It is in three compartments—early, midseason, and late. It is a fine range, but would be finer and better if converted into a span-roof, the aspect not being the best for its present form. The trees, as in the other houses, are models of their kind. The varieties, as they occupy each house, are not specified, but a digest from the whole will be given and selections for succession and exhibiting named. There is a span-roofed Cherry house, 91 feet long, 16½ feet wide, and 10 feet high, occupied with the best varieties in cultivation, and Maréchal Niel Roses, which are more extensively and better grown at Ketton than in any other private garden I have seen. There remains still another handsome span-roof, called the Camellia house, 45½ feet long, 30½ wide, and 17 feet high. The roof is covered with Maréchal Niel Roses, across the ends are fine Nectarine trees; on each side of the central path Camellias, Palms, and miscellaneous plants; and near one end a hedge of Ivy-leaved Pelargoniums that reaches from the ground nearly to the roof. Two varieties were planted, but Madame Crousse is by far the more free and floriferous, and produces trusses of blooms in thousands. A small

Wales, Dymond, Sea Eagle, Princess of Wales, and the Nectarine Peach. These will afford a supply in a cold house in the midlands from the middle of July to the middle of October. Lord Palmerston is excluded, because the fruit, though large, is pale and inferior in quality. The best Nectarines he considers are Lord Napier, Stanwick Elruge, Dryden, Goldoni, Rivers' Orange, Pine Apple, Byron, Spencer, and Victoria, these being alike good for show and for private use, and are named in order of ripening.

Mr. Hopwood derives pleasure in sending boxes of fruit to his friends, and perhaps no finer Peaches and Nectarines have been seen on royal and aristocratic tables than the selected examples from Ketton. They are packed in boxes 18 by 12 inches, and 4 inches deep.

A little must be said about the culture of Maréchal Niel Roses, of which 9000 blooms are cut yearly from the large Peach house—chiefly from one end of it, about a third or fourth the length of the structure, though some are grown at intervals the whole length of the central path and trained straight up to the roof. The Peach trellises in the Maréchal Niel end of the structure do not follow the arching of the roof, but the trees are planted about 6 feet from the sides of the house, and the trellises are taken straight up to the roof, the trees being trained as if to a wall, and on the borders in front of them up to the central path are arranged fruit trees in pots. The Roses on Briar stocks are planted 3 or 4 feet apart next the boundary walls, and there is thus ample room to pass between them and the Peach trellises. The growths are trained up wires about a foot from the roof, until they reach a little above the top of the Peach trellises, and the wires then stretched tightly over the space, and when covered with Roses form, so to say, when in flower, a flat ceiling of golden blooms. These are of the first

FIG. 25.—PEACH HOUSE AT KETTON HALL.

conservatory, Orchid house, and stove adjoin the mansion, and are attractively furnished with well-grown plants. As will be perceived, there is a considerable extent of glass at Ketton; indeed, the various structures cover nearly half an acre of ground. Mr. Divers prefers Weeks's upright tubular boiler for heating, for although others are set, in view of contingencies, he finds the one named the most certain to work continuously and uniformly over the greater length of time after stoking.

On an average about 7000 Peaches and Nectarines are gathered yearly. This shows that the trees are not thinly cropped for the production of sensational fruit; but good crops are grown, and the vigour of the trees with generous support enables the fruit to attain a more than average size. The shallow, well-drained borders permit of the free use of water, and it is given with no sparing hand when the crops are swelling, 3000 gallons at a time being applied in the "big" house. I do not remember seeing Peach borders kept so moist as these were, and both the trees and the fruit showed how they enjoyed and benefited by the liquid food. As ripening approaches moisture is lessened and the wood gradually and surely matures.

The largest fruits gathered are of Lord Palmerston, weighing 16 ozs., and measuring 12½ inches in circumference; Sea Eagle and the Nectarine Peach, 13 ozs., and measuring 12 inches; Princess of Wales, 12½ ozs., but an inch less in diameter than the two last named; Barrington and Prince of Wales, 12 ozs. and 11 ozs., and 11½ and 11 inches round respectively; but taking all their qualities into consideration, Mr. Divers recommends the following varieties for exhibition purposes:—Royal George, Crimson Galande, Prince of Wales, Bellegarde, Stirling Castle, Early Albert, Early Crawford, Princess of Wales, Barrington, Dagmar, Sea Eagle, and the Nectarine Peach. For private use in succession his choice is Alexander, Early Louise, Early Albert, Royal George, Stirling Castle, Goshawk, Crimson Galande, Prince of

size as produced by vigorous annual growths, for after flowering, or about June, all the shoots are cut back as closely as Vines are at the winter pruning, there being nothing left but bare rods and two sets of spurs, the lower near the base of the roof, the upper near the top of the trellis. By syringing and general good management the buds break strongly and produce "fat" growths, those from the base soon reaching to what may be termed the ceiling, those from the higher spurs extending across it. The term ceiling is a misnomer, but employed to make the method clear. When I saw them at the end of July the spring-like growths were about 2 feet in length; they are now probably more than thrice that length, and may have extended or nearly so over the desired space. I have seen them attain a length of more than 20 feet, and thicker than an ordinary pencil, after the summer pruning, and those are the growths for producing magnificent blooms. Some persons I know have tried the plan and failed, but that was their own fault; they erred culturally somewhere, and I am convinced both by experience and observation that the plan described, subject to such modifications as local circumstances suggest, is the simplest and best for growing the greatest number of the finest blooms under glass, and I am positive that in no other way could Mr. Divers cut 9000 of such as connoisseurs covet from the plants in his charge. Some persons appear to be impressed with the idea that for growing Peaches and Maréchal Roses satisfactorily the roof sashes must be moveable, and removed in the autumn. Without saying anything against the practice the fact may be noted that at Ketton the roofs of the houses are fixtures.

Not much can be said about the outside department, though flowers, fruit and vegetables are equally cared for and cultivated, as is fruit under glass. Chrysanthemums are in a most promising state. They receive the immediate attention of a son of Mr. Tunnington, of Liverpool the said son being the foreman at Ketton, and I will, Mr. Divers says, make someone a fine gardener some day. A "curled" wall standing

east and west is somewhat of a curiosity, as it is formed of a series of segments of circles, and thus presents various aspects; though no difference is apparent in the trees, the Morello Cherries on what may termed the north side are equally good whether they face due north or occupy the "curls" to the east or the west.

On the south side of another wall I found what I did not know before, and what I suspect many other persons do not know—namely, that the Alexander and Waterloo Peaches are, if not positively identical, so nearly alike that in no one character of the leaf or fruit is the difference discernible. The trees were planted on the same day, and fruits of both ripened on the same day, of the same size, same shape, same colour, same quality. The trees came from Sawbridgeworth, therefore it may be assumed both were true to name, as Mr. Rivers was the introducer of these early American Peaches, and the Ketton experience is commended to his distinguished consideration.

Mr. Divers has the park, farm, stock, and everything outdoors under his charge. The crops are excellent, and he has proved the value of the chemical manures advocated in the Home Farm department of this Journal, and estimates that an investment of £12 in grass manure yielded a profit of £30 in the increased yield of hay. No one can visit Ketton without admiring Mrs. Hopwood's splendid herd of Jerseys, some of which have won the highest honours at the Royal and other great shows. The working of machinery for various purposes by water power and turbines arrests notice; and if the visitor is privileged to enter the mansion he will find such an organ room and such an organ as he will have a difficulty in finding the equal in a family home; and further, if he is taken behind the scenes to "see the bellows blow" he will not forget it. The magnitude and mechanism of the whole arrangement cannot but surprise the outsider who for the first time gets inside the chamber, where the voice of the great instrument is supplied by hydraulic power, set in motion by touching a button in the room near the organ. Mr. Hopwood is a lover of music as well as of fruit, and an expert in both. Not satisfied with growing Peaches in England, he has "gone in" for Orange growing in Florida, and judging by his splendid photographs, for in this art he is skilled also, his mansion at Winter Park, Orange County, with the plantations surrounding, his estate must be very delightful. Of this Mr. Wm. Downs, Mr. Gilbert's foreman at Burghley, has been appointed manager, and goes out to "boss the niggers" in the autumn. He has no doubt received lessons from his "great chief" that will be of service, for Mr. Gilbert is not a better cultivator than he is a "manager," and an admirable trait in his character is his real friendliness to worthy young men, and his readiness to help them on in life. But I must stop, or my great chief will be after tomahawking me for taking up so much space in his Journal.

Ketton, I may add, is on the midland line between Leicester and Peterborough, and the station is within ten minutes' walk of the gardens. Mr. Divers' house is opposite the entrance gates, and the presiding genius there makes his visitors desirous of staying a little longer.—W.

THE WEATHER AND THE CROPS.

ALTHOUGH there has been no editorial invite for communications on this subject, as was the case last year, I have ventured on penning a brief report on the crops here. Taking fruit first, I have chronicled a total failure here of that important winter fruit, the Apple; the caterpillars never so much as allowed the trees to flower, so under these circumstances we could not reasonably expect Apples. The trees are, however, making good and clean growth, we therefore look forward to compensation next year. Strawberries were a good crop, as were Raspberries, Red and White Currants, while Black Currants were very light. Gooseberries were a remarkably heavy crop; after thinning for preserving, tarts, &c., many branches broke with the weight of fruit, and pleasant to relate, not a caterpillar was visible among the bushes the whole season. We have one Fig, at least there was one yesterday; it is only fair to add we have but three trees. Two Peach trees between them contrived to contribute three Peaches to the dessert in season on the 21st inst. Of Plums we have a good crop of Magnum Bonums; no other variety is bearing this year. We had a fine crop of Chisel Pears, there are a few of Doyenné d'Été, all the other trees are resting this year from fruit-bearing. Cherries of all kinds were a good crop. Apricots are here represented by only one tree; it may be that it objects to being isolated, at all events it has been five years planted and never yet borne a fruit. I have come to the conclusion that that portion of the wall might be more profitably employed. Nuts of all kinds are a very light crop. Thus ends my record of the fruit crops for 1889.

Flowers of all kinds have, until latterly, done remarkably well. Roses were never so good as this year. During the last few weeks we have rain more or less (most frequently the former) every day, and, with the exception of Begonias, all summer bedding plants are terribly washed out. I have never seen the land so wet or the ponds so full as during this week. The rainfall on Monday 19th last, day and night, was 1·2 of an inch. A good deal of hay is washed away in the low-lying meadows.

Vegetables, taken on the whole, are very satisfactory. The only crop unsatisfactory is Beet. I made two sowings of this, and obtained the seed from one of the leading English firms, and the best house in the south of Ireland, and now there is not half a crop. Onions are a splendid crop, the best I have had yet, and this year I have succeeded in getting a decent crop of Carrots for the first time free from maggots. Potatoes are badly diseased, but the tubers are a good size, while the quality is excellent when cooked. Tomatoes on outside walls are carry-

ing a fine lot of fruit and just commencing to ripen. I have tried ridge Cucumbers this year here for the first time, and they have proved a decided success.—R. WELLER, *Glenstal Castle Gardens, Limerick.*

[We are always glad to receive reports of this nature, and we thought this was understood by our readers.]

THE VIOLET, ITS CULTIVATION AND DISEASE.

[A paper read by Mr. M. A. Hunt before the Society of Indiana Florists.]

IN relation to soils most suitable for the Violet, having tried several with varying results, am satisfied that a heavy loam is the best; by this I mean one which will not break or crack though the admixture of sand be very slight. As to the method of growing, I do not believe that far north it is advisable to grow them in frames, either with or without fire heat, the uncertainty of the weather rendering it difficult to clean the plants properly, or gather the flowers with any degree of regularity. Give them bench room near the glass in a house by themselves, where the temperature can be kept under perfect control. I have found them to thrive best when kept about 10° above freezing at night, and on sunny days maintaining as low a temperature as possible without chilling the plants. The small grower who requires but a few each day for his own work, would in my opinion save money by buying of a brother florist who raises them in large quantity, or of some commission house, rather than undertake to grow a few under sash or in a house with other plants.

Of the disease to which the Violet is subject much has been written during the past year, but I have failed to see any cause assigned that was not disproved by the practice of other growers in different localities; methods which in the one case resulted in failure, in the other proved successful. So serious has this disease become that many large growers have entirely abandoned their cultivation, and it will be remembered Mr. Siebrecht, of New York, offered a reward of 100 dols. to anyone who would solve the problem, and notwithstanding many writers have given their experience with the pest, as well as advanced theories and surmises as to its cause, I still have to learn that any of them have drawn on friend Siebrecht for the reward.

The true solution may be as far in the future as ever, but in a visit not long since to Mr. John Cook, of Baltimore, Md., he was able to show results, the fruit as he believes of careful thought, observation, and experiment, which it seemed to me would be of interest to Violet growers to know. It will be remembered that Mr. Cook was the originator of that charming variety, Marie Louise, which was first placed on the market in 1872, and he now has two new varieties, the rose-coloured Mme. Millet offered last spring, and another, a sport from Swanley White, which he calls Robt. Garret, not yet distributed. In colour this resembles Neapolitan, but its promise of supremacy is in the great size of the flowers. The original stool as seen in January a year ago literally bristled with buds, while one fully expanded flower was 1½ inch in diameter by actual measurement. Mr. Cook grows about 120 sashes of Violets annually, and a varied experience of forty years in their care, coupled with the magnificent appearance of his plants at the time I saw them, would seem to show that, whether his theory is correct or not, his practice brings success.

He stated that the disease appeared with him about ten years ago, Marie Louise, which he had then been cultivating about eight years, being so much affected as to become practically valueless. The plants of this so badly affected that season were grown on his lowest bottom land, the disease showing itself about August 1st, previous to which the stools had been very large and fine. The following season, having some planted in frames for summer growth on his highest land, he noticed early in September that the stools under the sash rests, or bars of the frame, were clean and healthy, while those exposed to the full rays of the sun were badly affected with the disease. At first he thought this was the result of shade, observation in another line tending to confirm him in this conclusion, and this was the Pear blight. Among his fruit trees was a row of Pears, west of which ran a row of large evergreens. Both rows were at such an angle as to cause a complete shade to cover the Pears from eleven o'clock through the day. Every tree so shaded was free from blight, while trees at either end of the row in the full sunlight were much diseased. But to return to the Violet. Careful and patient watching convinced him that it was not the shade that prevented, but the dew that caused the mischief, and his theory is this:—The same fever-producing agency—be it what it may—which will bring a strong man down when exposed for any length of time to the dews and miasmatic influences of the night air, is the producing agent of the disease in the Violet. The drop of dew on the leaf exposed to an August sun evaporates, leaving whatever there may be of poison in a concentrated form on the leaf. Acting on this theory he plants all his Violets for summer growing in narrow beds, and as soon as there are any signs of dew covers them by stretching waterproof fibre cloth on frames so prepared as to keep the cloth well above the plants, thus securing a circulation of air. The covering is carefully removed in the morning, and the same process gone through with each day until they are housed in winter quarters.

Whatever may be thought of the theory as to the cause, the cure with him seems to be effectual, as plants grown near the others and given the same treatment in every way, save in the matter of night covering, are badly diseased. We are apt to look upon long continued, intelligent and successful methods as proofs of the system followed, and if any of our Violet growers desire to test this method for themselves, and should it prove as effectual with others who have been troubled

with the disease as with Mr. Cook, I have no doubt he could be prevailed upon to receive Mr. Siebrecht's cheque for 100 dollars.

TAKING THE BUDS.

In your issue for the 15th inst., at page 135, there appears a very interesting paragraph by "A Four-years Experimenter" about "taking buds of Chrysanthemums." I would like, through the columns of your valuable paper, to detail my experience in taking "buds" to appear at the stated time. In this locality, which I expect will be reckoned the "north of England," I agree with him that it is scarcely possible to obtain good and perfect flowers of Boule d'Or from natural grown plants, no matter when they are propagated. I have three plants of that variety which were rooted in a frame in a cool Peach house the third week of February; they were transferred to 6-inch pots 22nd March, thence to a cold frame outside. I pinched them on 24th May, and finally potted them on 3rd June, they being at that time 22 inches in height. They grew exactly 24 inches before showing their crown bud, which I "set" on the 16th inst. Madame C. Audiguier I pinched 29th May, and set its buds on the 15th inst. I may mention that it grew 4 feet before showing the crown bud. Comte de Germiny, from plants propagated in December of 1888, and allowed to break naturally, have shown their crown buds this date—viz., 19th August, as has also Mdle. Lacroix, Elaine, Ralph Brocklebank, and Golden Empress of India. Buds of Duchess of Albany I expect in a day or two from plants pinched on the 14th May. I do not think good flowers can be had by taking the buds any earlier than the 10th of August.—A. INNES, *Duncombe Park Gardens, Helmsley.*

"SETTING THE BUD" v. "TAKING THE BUD."

WE have now arrived at the most anxious time in the cultivation of the Chrysanthemum, I allude to "taking the bud." Now this has always been a puzzle to me why it is not called "setting the bud." After thinking it over I come to no other conclusion than that it is done simply to mystify young beginners as much as possible. I well remember some nine years ago, just as I was beginning to know something about crown blooms, when in conversation with a now well-known cultivator, after he had answered numerous questions, I drew his attention to a crown bloom only just showing, and asked him whether, if the small points or shoots surrounding it were removed, if it would not develop into what was called an exhibition bloom. Much to my surprise he seemed unwilling to make any reply. This I thought strange, as I particularly wished for his opinion. His reason, as I have suggested, was to keep what he knew to himself. But probably some cultivator will find little trouble in explaining why a bud which is not removed should be called "taking the bud."—F. C. BARKER.

ROYAL HORTICULTURAL SOCIETY.

AUGUST 27TH.

THE Drill Hall at James Street, Westminster, was again, to the surprise of many visitors, filled with exhibits, mainly groups and plants submitted to the Floral and Orchid Committees. The display was more varied than usual, and sufficient brightness was imparted by the brilliantly coloured spikes of Gladioli, which, with Dahlias, almost exclusively occupied one table the whole length of the Hall. One group of variegated tree and shrub specimens was a welcome addition to the exhibits, as these are too seldom seen at meetings or exhibitions.

FRUIT COMMITTEE.—Present: R. D. Blackmore, Esq., in the chair, and Messrs. P. Crowley, J. Cheal, W. Bates, G. W. Cummins, J. Willard, J. Saltmarsh, G. Bunyard, G. Wythes, J. Hudson, F. J. Lane, and J. Smith.

The exhibits were few at this meeting, but the collection of fifteen dishes of Apples from A. H. Smee, Esq., The Grange, Wallington (gardener, Mr. Cummins), were extremely fresh and good, Lord Grosvenor, Duchess of Oldenburg, and Williams' Favourite being very notable (cultural commendation). Messrs. J. Veitch & Sons, Chelsea, were awarded a bronze medal for a collection of Plums, comprising good samples of Kirke's, Golden Drop, Belgian Purple, Victoria, Frogmore, Lawson's Golden Gage, Goliath, Large Black Imperial, Washington, Denniston's Superb, Sultan, Duke of Edinburgh, and Mitchelson's. Melons are now so frequently shown, and so many have been honoured at various times, that a variety must possess some very good qualities to obtain recognition. Seedling Melons were sent at this meeting by Mr. E. B. Holmes, Maidstone; Major Egerton, Alverley Hall (gardener, Mr. H. C. Denton); Mr. J. Spong, Lindisfarne Gardens, Bournemouth; and by Mr. C. Brook, The Gardens, Red Rice, Andover. All were passed by the Committee either as insufficiently distinct, or as in unsuitable condition for adjudication. Mr. J. Church, Milford Hall Gardens, Suffolk, sent a Giant Capsicum of great size and fine colour.

FLORAL COMMITTEE.—Present: Shirley Hibberd, Esq., in the chair,

Dr. M. T. Masters, and Messrs. Druery, Herbst, W. Goldring, W. H. Williams, R. B. Lowe, W. Ingram, C. Noble, T. Baines, L. Castle, B. Wynne, H. Turner, and J. Fraser.

The extensive group of Gladioli and Dahlias from Messrs. Kelway and Son, Langport, was the most imposing feature of the meeting, and in addition to the silver-gilt medal awarded, several varieties were selected for special honours. Messrs. Keynes, Williams & Co., Salisbury, also had handsome blooms of Show and Cactus Dahlias, some of which were selected for awards of merit (silver medal). Mr. T. S. Ware, Tottenham, had a large group of hardy flowers, single Cactus, and Pompon Dahlias (silver medal). The Ferns, Crotons, and Bouvardias from Mr. H. B. May, Edmonton, secured him a silver medal, and constituted a varied and effective group. Messrs. Paul & Son, Cheshunt, contributed a group of specimens of variegated trees and shrubs, a large number of the most ornamental varieties being represented (bronze medal). Messrs. J. Carter & Co., High Holborn, had specimens in pots of their dwarf Queen Asters, a good type of the Chrysanthemum flowered group, the colours being dark and light blue, white, rose, copper red, and crimson (vote of thanks). Mr. R. Dean, Ealing, sent flowers of dwarf German Scabiouses gathered from the open ground, the colours most varied, from maroon crimson to pure white (strain commended).

Messrs. J. Veitch & Sons, Chelsea, showed a plant of the distinct *Lilium nepalense*, which has been previously certificated and figured in this Journal. A box of Rhododendrons was also contributed, and one variety was selected for a certificate. Mr. B. S. Williams, Upper Holloway, exhibited several novelties, including two white-spaced Anthuriums, *Dracena indivisa variegata*, and a fine Palm, *Carludovica palmifolia* (certificated). Mr. T. J. Dranfield, The Valentines Gardens, Ilford, had a collection of Violas; Mr. J. T. West, Cornwallis, Brentford, Cactus Dahlias; Messrs. Jackson & Son, Woking, a new Clematis named Mrs. Baron Veillard, with flowers of a mauve colour; and Mr. G. S. P. Harris, Orpington, showed some Dahlia blooms.

ORCHID COMMITTEE.—Present: Dr. M. T. Masters in the chair, and Messrs. H. Williams, H. M. Pollett, J. Dominy, C. Pilcher, E. Hill, J. O'Brien, and L. Castle.

The duties of this Committee were very light at this meeting, and a short time sufficed to pass judgment on the few exhibits. With regard to one of the plants shown the question arose as to whether old but scarce Orchids were admissible for certificates, and the Secretary stated they were, it being left to the discretion of the Committee to determine whether they possess sufficient horticultural merit to entitle them to recognition. Many no doubt are deterred from sending plants because they think only novelties would be recognised. Messrs. J. Veitch and Sons showed a specimen of *Phaius philippinense*, but no information was forthcoming respecting its history. The flowers are small with dull red petals, paler sepals, and a white lip with a few purple veins. The growth is slender and the leaves narrow. The Duke of Marlborough, Blenheim (gardener, Mr. Whillans), showed several varieties of *Lælia elegans*, but only one (The Duchess) was considered sufficiently distinct. H. J. Hollington, Esq., Forty Hill, had a fine variety of *Cattleya crispa*, the sepals and petals pale mauve, the lip dark crimson, and much crisped (vote of thanks). Mr. Malcom Cook, Kingston Hill (gardener, Mr. Cullimore), sent several fine varieties of *Lælia elegans*, and several other plants (bronze medal). The varieties of *Lælia elegans* are now very numerous and much prized by many of the leading Orchid amateurs, collections being formed in some cases, notably by Mr. Measures of Streatham, of all the best varieties obtainable, and the range of variations is astonishing. Mr. T. S. Ware had two curious terrestrial Orchids in his group, which ought to have been brought under the notice of the Orchid Committee—namely, *Satyrium aurantiacum* and *S. carneum roseum*; the former with yellow flowers, the latter pale pink. It is regrettable that other terrestrial Orchids are not more frequently shown and brought into notice.

CERTIFICATED PLANTS.

Watsonia rosea (T. S. Ware).—A beautiful bulbous plant with tall graceful spikes of bright rose coloured flowers and long slender Iris-like leaves.

Pteris serrulata densa (H. B. May).—A charming little Fern, very dwarf and compact, with fresh light green fronds, divided into the finest segments, quite lace-like in appearance.

Sarracenia decora (J. Veitch & Sons).—A hybrid between *S. variolaris* and *S. psittacina*, with deep red "pitchers," relieved with round white spots and green veins; bright, distinct, and good.

Carludovica palmifolia (B. S. Williams).—A handsome and useful Palm, with fine arching leaves about 2 feet long, deeply divided, the divisions 4 to 6 inches in diameter.

Lælia elegans Duchess (Duke of Marlborough).—A distinct variety, with large flowers, the sepals and petals of a soft rosy colour, the lip broad, crimson, fading to a lighter margin, the lateral lobes white and the centre yellow.

Lælia elegans, Cook's variety (Mr. M. Cook).—Flowers small compared with most other varieties, but distinguished by the rich crimson hue suffusing the sepals and petals, still deeper in the lip.

Angraecum Chaillyanum (Mr. F. G. Tautz).—This is not new to orchidists, but it is little known and deserved the recognition it received. The plant is of moderate growth, the racemes containing numerous flowers with white acute recurving narrow sepals and petals, the spur 4 or 5 inches long, and green.

Taxus adpressa variegata (Fisher, Son & Sibray).—A variety with the young shoots variegated with a golden tint.

AWARDS OF MERIT.

Satyrium carneum roseum (T. S. Ware).—Delicate pink flowers in a large fleshy spike, having broad ovate leaves at the base, some partly encircling the spike.

Gladioli (Kelway & Son).—*Duchess of Fife*, fine flowers and spikes white streaked with rich crimson, buff centre; *Vulso*, soft salmon red, white centre, large spike.

Papaver nudicaule sulphurea (T. S. Ware).—One of the Iceland Poppies, with pale sulphur yellow flowers, distinct from the other varieties.

Dahlia F. L. Temple (T. S. Ware).—One of the Paragon type, with large, well-formed blooms, velvety maroon edged with crimson.

Bouvardia Hogarth flore-pleno (H. B. May).—Like its well-known parent in colour and habit, but having large double neatly formed flowers.

Rhododendron Ophelia (J. Veitch & Son).—One of the greenhouse hybrid type, having large mauve pink flowers, the corolla lobes rounded, the truss large, and the colour distinct.

Chrysanthemum Maude Pitcher (G. Stevens).—A sport from the early flowering *Précocité*, deep bronzy yellow, quite distinct from its parent, and apparently well fixed.

Hollyhock Delicata (Webb & Brand).—A fine, deep, well-formed flower of a soft salmon tint.

Catasetum tubulare laeve (B. S. Williams).—A peculiar Orchid with greenish dotted flowers, the lip greenish, with a prominent tongue-like white centre.

Show Dahlias (Keynes, Williams & Co.).—*Reliance*, buff yellow tinged with bronze, slight crimson tip. *John Hickling*, bright clear yellow, very handsome deep bloom. *Crimson Globe*, dark crimson scarlet, neat well built bloom. *Asia*, a Cactus Dahlia with delicate blush pink blooms and white centre, a beautiful variety.

GATEACRE HORTICULTURAL SOCIETY.

THE description of the Nottingham allotment gardens was truly interesting, and tempted me to visit Gateacre, a quiet and pleasant village situated in a fertile valley six or seven miles south of Liverpool. My object was to see the results of the eighteen years' labour of the above Society. It has been established on a wider basis than most societies of a similar nature, and is doing a work that might with advantage be copied by many others. It is unfortunate perhaps that the majority of societies are content with the mere holding of one, two, or more exhibitions annually, which is the full extent of their interest and influence in promoting a love for the garden and gardening. I do not doubt for one moment that they exert a stimulating influence for good, but it is limited in comparison to the work of such a Society as that which forms the subject of these notes. The schedule of this Society provides forty-five classes, and of these seven are devoted to prizes for the neatest, best kept, and cultivated summer garden. Twenty-one prizes are offered for gardens, and in addition the President, Sir A. B. Walker, Bart., gives twelve extra prizes, value £5. The first two classes provide for gardeners and assistants, and are divided into two sections according to the ground at the disposal of the competitors. The remaining five classes are for amateurs and cottagers, and these are divided in a similar manner. These arrangements simplify the work of the judges, for it is very difficult to compare flowers and kitchen gardens by the side of flower gardens only. Some have vegetable gardens attached to their house, others have not, so that the sections are arranged according to the size and extent of the ground at the disposal of those who wish to enter the various classes. There can be no question that the Society's influence has done much to render many a small plot of garden bright and cheerful, and the friendly rivalry between neighbours is of the keenest description. It is indeed questionable if neater, better kept, or more tastefully arranged small gardens can be found in any village, the suburb of any town or city in the kingdom.

Many of these model gardens, for that applies more appropriately to them than perhaps any other term, do not exceed 25 square yards of ground, and several of them are less. These little plots are neatly laid out with Box and other edging plants, the walks in most cases the paths are gravelled, but the surroundings are such that detract materially from the beauty of these little gardens. I observed, however, that some of the cultivators were doing their best to hide the objects that destroy the effect of their small gardens. In one case I noticed a low shed hidden from the flower garden by a good row of Sweet Peas. In another garden the black palings were completely hidden by training Scarlet Runner Beans to them. They looked well, and from all appearance would prove a profitable crop.

The President and several other gentlemen in the neighbourhood are deeply interested in this Society and its work, believing that it will be the means of fostering in the minds of the young a love for horticulture, whilst the present inmates, at least, will be induced to keep their homes in the same clean, neat, and excellent conditions as they do their gardens. The inhabitants of Gateacre and neighbourhood highly appreciate the Society, as was evident by the manner in which they flocked to visit the Exhibition, which was held in "The Grange" grounds, the President's Lancashire home. The grounds and houses are thrown open to all who visit the Exhibition, and this privilege is evidently one of the great attractions of the day. The whole of the school children with their teachers attend, and tea is provided for them. No attempt will be made to describe any of the exhibits, suffice it to say the classes were well filled and the whole were very praiseworthy.

Mr. Kneale, gardener to Major Gaskell, Roseleigh Woolton, exhibited a basket of a seedling Verbena in pots named Highcliffe Scarlet. It is a strong grower, and from all appearance a very free bloomer; the truss is large, the flowers bright scarlet with a striking white eye. It is said to be a good bedder.

Mr. Glover, gardener to Sir A. B. Walker, Bart., is the Hon. Secretary of this Society, and his large and varied experience enables him to carry out the various details in an efficient and successful manner.—WM. BARDNEY.

DRYING AND CRUSHING FRUITS.

At the Show of the Royal Agricultural Society which was held at Windsor, many interesting objects were exhibited. Among these a prominent position was occupied by the machines for drying and

FIG. 26.

crushing fruit and vegetables manufactured and exhibited by Messrs. Ph. Mayfarth & Co. of Frankfort-on-Maine. Americans have hitherto supplied the markets of the world with dried fruits and drying appliances; they may be found in Germany, France, and other countries in which the manufacture of fruit wines and cider has been brought to a flourishing and highly remunerative point. Influenced by these considerations, science and practice have recently been called into requisition in Europe, and particularly in Germany, in order to deal with and solve the question of the improvement of fruit and vegetable products. As a consequence it was recognised that the better turning

FIG. 27.

to account of fruit and vegetables was the natural and most potent incentive to increasing and promoting their cultivation. And thus it was seen that the conversion of fresh products into goods which shall be easily transportable and will keep well when dried was the essential

condition for turning them to better account. When the drying apparatus and wine press are worked together the greatest advantage is secured, fruit can be properly sorted, the finest being sold in its fresh state, the medium dried, and the remainder utilised in the production of fruit wine, and thus everything is turned to the best account. Convinced of the importance of the subject, the Royal Agricultural Society offered a good prize for the best drying apparatus. After careful experimental working extending over four days this prize was awarded to Dr. Ryder's patent, manufactured by Messrs. Ph. Mayfarth and Co. This is represented in fig. 26, and full particulars for working are given in the circulars of the firm.

For the preparation of wine, not only are Apples and Pears suitable, but also Gooseberries, Currants, Raspberries, Blackberries, Bilberries, &c. For the production of such wine in general only a press is necessary, and in addition a fruit-grinding mill when Apples and Pears are to be used. A small press is shown in fig. 27. One person suffices to work this press. He does not need to go around it, but by an ingenious ratchet motion the lever is worked from side to side, pressing out the juice completely.

NANTCOCH HOUSE,

THE residence of T. Colborne, Esq., is situated upon the north-west side of and distant about two miles from the seaport town of Newport, Monmouth. The house is a magnificent and substantial red stone building of Gothic style, and is about three miles inland of the Bristol Channel, standing upon an elevated position and commanding a beautiful view. Upon each side of the drive are fine borders of dwarf Roses and herbaceous plants, while in front of the mansion is a large and well kept lawn, with flower beds and large clumps of Rhododendrons and young specimen Conifers. The conservatory is attached to the west side, and is beautifully decorated with a good collection of flowering plants. Upon the north side of mansion is a beautiful bowling saloon some 75 feet long by 15 wide, which is beautifully adorned with flowering plants. Leading from the bowling saloon is a range of vineries, the first to be entered being the late house, which contains a good crop of Grapes of the following kinds:—Lady Downe's, Gros Colman, and Mrs. Pearson, the bunches large, berries fair, and promising to finish well. The border is outside, which permits of the inside of this house being utilised for Camellias. A fine centre border contains some eighteen or twenty trees, and upon the back wall are trained six trees, which are all well set with buds, and looking strong and healthy. In this house are also some specimens of *Adiantum cuneatum*, also tuberous Begonias, and three very creditable Peach trees grown in 18-inch pots, bearing a magnificent crop. The variety is the Maltese Peach.

The second early house is also looking well with its large black clusters of Black Hamburg, Foster's Seedling, and Mrs. Pince, the latter being very good, the bunches large, berries also, and of capital colour, and the bunches even throughout the house. A fine specimen of *Ficus elastica* is trained up the back wall. There are also some specimen plants of *Azalea indica* trained in pyramidal shape. The next house being the early vinery is planted with all Black Hamburgs, the bunches even in size, and averaging about 4 lbs. each; the colour is a dense blue black, and the individual berries measure 1 inch in diameter, the bunches firm and well shouldered. Another house contains a fine collection of Zonal Pelargoniums. Upon the back wall are grown Tomatoes. The varieties are Dedham Favourite, Hackworth Park, and Optimist, the latter doing well. In the frame ground we noticed Primulas, Cinerarias, and many other winter flowering plants.

The kitchen garden is well stocked with all kinds of vegetables. Peas being extra good, and small fruit abundant. The second fruit garden is also looking well with its fine borders of Roses all around the paths with clumps of herbaceous plants. Also noticeable in this garden is a hardy fernery well laid out, and through which runs a stream of water, and the stream is utilised for beds of the useful salad Watercress. In this garden is a large round cement tank for catching the rain water from the glass houses and outbuildings, which is connected to the tank by means of small pipes. After a day or two's rain the tank is capable of supplying the garden with water for a couple of months.

In the chief fruit garden, in which there is a magnificent Peach wall, the trees in good health making beautiful bearing wood, not too strong or too weak, but just the kind of wood one likes to see. They are swelling a fine crop of fruit. The varieties are of Peaches:—Royal George, Maltese, Bellegarde, and Early Ann. Nectarines:—Elruge and Pine Apple. Upon the walks are stood some 400 pots of Chrysanthemums of the best varieties. They are all trained upon the single stem, and are looking strong, with rich foliage down to pots, and when in bloom will no doubt be worth the special attention which has been paid to them. The Apples and Pears are up to the average, and the orchard trees are bearing fair crops.

Leaving this garden, we travel east of the mansion, finding ourselves amongst four or five lakes of water with paths leading in different directions over brooks, &c. In the ponds are some plants of *Nymphaea alba*, the white Water Lily. From this point we view the head gardener's house, which is situated about three minutes' walk from the garden, a fine red stone building in Gothic style with a garden attached. An hour's visit to Nantcoch did not permit me to give fuller details, but I was pleased to hear from my guide that Mr. Colborne is a great horticulturist, and takes every interest in his magnificent garden, and he opens to the public every year a grand Chrysanthemum show at a nominal fee, which is handed over to a charitable institution. I was informed some hundreds of persons avail themselves of the opportunity

of seeing a handsome display of Chrysanthemums, and by the appearance of the hundreds of plants now preparing the Show promises to be one worth travelling a few miles to see.—H. MITCHELL, *Frines Garden, Monmouthshire.*

HORTICULTURAL SHOWS.

SHROPSHIRE.

THE annual summer Exhibition of the Shropshire Floral and Horticultural Society, now well known as the Shrewsbury Show, was held in the Quarry Grounds of that town on August 21st and 22nd. The entries exceeded last and all previous years by upwards of 300. The quality in all departments was of an unusually high order, and from a purely gardening point of view the Exhibition was an undoubted success. Local growers were well to the fore, and evince a determination to hold their own. The weather on both days was not favourable; showers occurred frequently, and sometimes so heavy that the canvas was penetrated and some of the exhibits saturated. In the case of many shows it would have resulted in a complete failure from non-attendance; but it was far from having this effect at Shrewsbury, as upwards of 40,000 people visited the Show, and the receipts at the gates during the two days amounted to the handsome sum of £1206. This is £200 or £300 below last year, but it is still encouraging, as in 1875, when the Show was commenced, the gate-money only amounted to £394, and it has been as low as £271.

The arrangements were admirable in all departments. As in times past Messrs. Alnutt and Naunton, the Honorary Secretaries, were unremitting in their vigilance, aided by an industrious Committee.

PLANTS.

The main exhibits of these were arranged in a huge tent measuring 140 feet in length and 80 feet in width. Tall Palms and the largest specimens occupied the centre, the smaller being round the sides, and the effect when it was possible to observe it was excellent. The class for twenty stove and greenhouse plants in bloom or foliage, not less than ten in bloom, with prizes of £25, £20, and £15, brought three collections. Mr. Finch, gardener to J. Marriott, Esq., Coventry, eventually gained the first prize, and left Mr. Cypher second. The best plants in the first were some grand fresh specimens of *Dipladenia Regina*, *Ixora Williamsi*, *I. Fraseri*, *Miltonia spectabilis*, a conical mound over a yard in height; *Lapageria alba*, *Stephanotis floribunda*, *Allamanda Hendersonii*, *Croton Queen Victoria*, *C. Martii*, *Erica Thompsoni*, *E. Marnockiana*, *E. Lindleyana*, *Kentia australis*, *Cycas circinalis*, and *Latania borbonica*. Mr. Cypher's group contained more *Ericas* of a telling character. Mr. Charles Roberts, gardener to A. Nicholson, Esq., Highfield Hall, Leek, was third. The class for the nine stove and greenhouse plants was less prominent, but the specimens in the first prize group from Messrs. Pritchard & Sons, Shrewsbury, were healthy, well grown, and in fine condition, as were also those from Mr. Flock, gardener to the Marquis of Cholmondeley, Malpas, which came second, and Mr. Farrant, gardener to Mrs. Juson, Abbey Foregate, Shrewsbury, was third. Mr. C. Pearson, gardener to Lord Berwick, Attingham, was first for six stove and greenhouse plants, his *Bougainvillea glabra* and *Statice profusa* being very fine, and Mr. Farrant secured both the second and third prizes in this class with small but useful plants.

Exotic Ferns were largely shown, and Mr. Lambert, gardener to Col. Wingfield, Onslow, secured the first prize for six specimens. They were all finely grown, luxuriant, and clean, and consisted of *Hymenophyllum demissum*, *Miroclepia hirta cristata*, *Davallia Mooreana*, *Adiantum cuneatum*, *A. farleyense*, and *Neottopteris Nidus*. Mr. Cypher was second, and Mr. Roberts third, both showing well. In the Salop class for six Ferns Mr. Lambert also secured first prize, and was closely followed by Mr. Milner, gardener to Rev. J. D. Corbet, Sundorne Castle, Shrewsbury, and Mr. Farrant. The class for six plants in flower, Orchids excluded, was one of the best in the Show, and there Mr. Cypher came first with finely flowered specimens of *Statice profusa*, *Erica Marnockiana*, *E. Eweriana*, *Bougainvillea glabra*, *Clerodendron Balfourianum*, and *Allamanda grandiflora*. Mr. Roberts was second, and Mr. Finch third. The Palms made a fine display, and the first prize for six was awarded to Mr. G. Williams, gardener to S. Baerlein, Esq., Oak Dene, Didsbury, Manchester, with well developed plants, the best of which were *Kentia australis*, *K. Fosteriana*, *K. Belmoreana*, and *Latania borbonica*. Mr. Roberts took second, and Mr. Cypher third. Mr. Lambert cleared the boards in the class for six Dracenas by taking all the prizes with capital plants. Messrs. Pritchard and Sons had first and second for six *Caladiums*, Mr. Farrant third with large plants well furnished. Mr. J. Barker, Grammar Schools, Shrewsbury, was first for four *Coleuses* with well grown pyramid plants.

Tuberous Begonias were excellent, the best coming from Mr. Davies, gardener to General Jenkins, Crockton Hall; Mr. Henry Owen, The Cedars, and Mr. Lawrence, Mayfield. Fuchsias were hardly so large as formerly, but indicated much care in culture, especially those from Mr. Phillips, gardener to the Hon. W. H. Herbert Prestfelde, Mr. Wyley, Council House, Shrewsbury, and Mr. Farrant, which won in the order named. Double and Zonal Pelargoniums were good from Messrs. Pritchard & Sons and Mr. Phillips, and inferior plants throughout the Show were remarkable for their scarcity.

The collection of miscellaneous plants arranged for effect and occupying a space 100 feet square call for special notice, as the exhibits here were more numerous than they have been for some years. Mr. Williams, Didsbury, Manchester, secured first and second prize, and

Messrs. Jones & Sons, Shrewsbury, third. The two former resembled each other a good deal in their outline but different in contents. Palms and Crotons were largely used, and with these were graceful sprays of *Humea elegans* and crimson *Celosias*. The margin was formed with little Cactuses, and the groundwork composed of Maidenhair Fern. Messrs. Jones' group was light and graceful, but lacking in distinctive features. Not for competition, Messrs. Pritchard arranged an extensive group decidedly pretty in outline. The chief prizetakers for stove and greenhouse plants, *Coleus*, *Fuchsias*, *Begonias*, *Achimenes*, *Gloxinias*, *Balsams*, &c., were Mr. Henry Owen, Dr. Burd, Mr. J. Barker, Mr. G. Burr, Mr. Edward George, Mrs. Edith Brooks, and Mrs. Wace, College Hill. The prizes for twelve table plants, a good class, were taken by Mr. Farrant and Mr. Lambert.

CUT FLOWERS.

These were extensively shown and highly attractive, but many of them would have been better had they escaped the recent rains. Roses headed the list, and the class for twenty-four varieties was well filled. Here Messrs. Perkins & Sons, Coventry, secured the first and second prizes, and Messrs. Dicksons (Limited), Chester, third. Messrs. Heath and Son, Cheltenham, were prominent in the class for eighteen blooms, securing first prize with a stand of fresh high quality flowers. Messrs. Burrell & Co., Stone Nurseries, Cambridge, were second; and Mr. James Davies, gardener to Rev. H. S. Sturges, Leominster, third. The amateurs' Rose classes were also well filled, Mr. George Townsend, Uffington; Mr. Newman, Leominster; and Mr. Williams, Shrewsbury, being the chief prizewinners. Messrs. Heath secured first prize for thirty-six Dahlias with excellent blooms. Mr. W. Shaw, Blakebrook, Kidderminster, was second; and Mr. Davies third. The same prizetakers in like order secured the awards in the class for twenty-four Dahlias. Single Dahlias were well shown, Mr. W. Shaw, Messrs. Jones, and Mr. W. Maund winning. Cut *Gladiolus* were magnificent, especially those from Messrs. Burrell, some of the spikes having as many as nineteen fully opened and perfect flowers on them, and one variety in the stand of eighteen, named Snowden, received a first-class certificate. Mr. W. Shaw also exhibited a fine stand in this class, which was awarded third prize. Asters indicated having been out in the wet, and so did the *Phloxes*, but the twelve bunches of stove or greenhouse flowers were grand; Mr. Blair, Trentham; Mr. Bremmell, Wellington; and Mr. W. Shaw taking the prizes in the order named.

Hardy herbaceous flowers were excellent from Messrs. Burrell; Messrs. Dicksons, Chester; and Messrs. Pritchard. Carnations and Picotees were attractive and well shown, the first prizes in both classes going to Mr. A. E. W. Darby, Great Ness, Shrewsbury; and the remainder to Mr. Fletcher, Priors Lee. The best Marigolds came from Mr. Abel Lowe, Honnington Wood; Mr. Fletcher, and Mr. Maund; and the best Pansies from Mr. Albert Myers, Sutton Lane Nurseries; Mr. Pattison, Shrewsbury; and Mr. Fowles, Shrewsbury. The bouquets were generally admitted to be the finest ever exhibited at Shrewsbury, and we have rarely seen them equalled elsewhere. For the ball or hand bouquet Mr. A. Heine, Birchfield, Manchester, was first with a marvellously good one, Messrs. Perkins second, Messrs. Jones third, and Mr. Blair fourth. For a bridal bouquet the three first preceding exhibitors occupied their previous position, Mr. Heine's work of art again standing well out; Messrs. Jones secured all the prizes for the stand of cut flowers; and Mr. G. Townsend both prizes in the classes for a hand and bridal bouquet in the amateurs' section. Some scores of baskets of wild flowers were exhibited, the arrangement in many cases being excellent, and the whole an attractive feature. As a matter of course the prize-winners were chiefly ladies.

FRUIT.

As usual the fruit was a great feature of the Show, and as is always the case where the prizes are good and the competition keen, much interest was displayed in the leading classes. The quality generally may be summed up as excellent, but the Grapes bore more traces of having been tarnished in transit than we are accustomed to see. There were three exhibitors of twelve dishes of fruit, and Mr. Goodacre, Elvaston Castle, Derby, secured the first prize of £10, exhibiting a most meritorious collection. In Grapes he had large well coloured Black Hamburgs, fine Muscat of Alexandria and Gros Maroc, a good Smooth Cayenne Pine Apple, Hero of Lockinge Melon, Barrington Peach, Figs, Elruge Nectarine, Moor Park Apricots, Kirk's Plum, and Morello Cherries, all in high condition. Mr. Dawes, Temple Newsam, Leeds, was a good second with fine Grapes, but unfortunately a little tarnished in travelling. The Queen Pine was excellent, and Royal George Peaches grand. The third prize was awarded to Mr. Gilman, Ingestre Hall, Stafford, whose exhibits were not so large as some of the others, but the quality was superb, the Barrington Peaches conspicuous for their excellence. In the collection of nine dishes, Mr. Milner, gardener to Rev. J. D. Corbet, Sundorne Castle, Shrewsbury, was first amongst five exhibitors. His collection included very fine Black Hamburg and Buckland Sweetwater Grapes, with Melon, Peaches, Cherries, Pears, &c., all of superior quality, and well staged. Mr. J. Lambert, gardener to Colonel Wingfield, Onslow Hall, Shrewsbury, was a close second, and Mr. Pearson, gardener to Lord Berwick, Attingham, third.

Grapes.—The big Grape class, in which £10, £6, and £3 are offered for six bunches of black Grapes, of three varieties, contained eight exhibitors. Mr. Goodacre secured the leading prize with Gros Maroc, large in berry and bunch and perfectly coloured; Black Hamburg, about 4 lbs. in weight and very perfect; and Madresfield Court, fine in bunch and berry. Second Mr. Stevenson, gardener to Col. Pilkington, Prescott, with Black Hamburg, Black Alicante, and Madresfield Court,

all very good, but the latter not quite so well finished as the others. Mr. Dawes came third with smaller but well coloured and shapely bunches.

In the class for three bunches of Black Hamburg Grapes Mr. W. Bottomley, gardener to Miss Evans, Hurst House, Prescott, very justly took leading honours with fine specimens, extra good in berry and colour; Mr. Stevenson coming second; and Mr. Bremmell, Wellington, third with bunches of unusual size. Seven competitors staged in the class for any other black Grape, and Mr. Middleton, gardener to H. Pilkington, Esq., was placed first with three grand bunches of Madresfield Court. Mr. J. Barker, gardener to J. T. Raynes Esq., Rock Ferry, second; and Mr. Stevenson third. In the class for four bunches of white Grapes the exhibits were of a very superior order; Mr. J. Edmonds, gardener to the Duke of St. Albans, Bestwood, Notts, being first with two grandly grown bunches of Muscat of Alexandria and Foster's Seedling. Mr. Middleton came second, and Mr. Goodacre third with specimens but little inferior to the first. The class for three bunches of Muscats contained some excellent exhibits of this fine Grape; Mr. J. T. Harris, The Hayes, Stone, being first; Lord Tollemache, Tarporey, second; and Mr. C. Lee, Campbell, Ross, third. Eleven lots were staged in the class for three bunches of any other white Grape. Mr. W. Bottomley, Prescott, was placed first with three faultless bunches of Buckland Sweetwater; Mr. George Meakin, Cresswell Hall, Stafford, and Mr. Middleton following with Foster's Seedling in fine form. The Grape classes confined to the county of Salop were well filled, and the exhibits were highly creditable to local growers. In the class for four bunches in two varieties of black Grapes Mr. S. Bremmell, Wellington, was first; Mr. Lambert second; and Mr. Milner third; Black Hamburg and Madresfield Court being remarkably good on each stand. In the corresponding class for three bunches of white Grapes Mr. Milner came first, Mr. Bremmell second; and Mr. Pearson, gardener to Lord Berwick, third. The amateur Grape classes showed a decided improvement, and the exhibits here from Mr. W. Adams, Mr. Barker, and Mr. G. Burr did them much credit.

The Peach class is always well filled at Shrewsbury, and this year it was, if anything, better than ever. The six splendid fruit of Royal George, shown by Mr. Gilman, which secured the first prize, were unusually fine; and the Barringtons from Mr. J. G. Morris, Allerton Priory, Liverpool, and Mr. Goodacre, that gained the second and third prizes, were close up to the first. Nectarines were also of fine size and highly coloured, Mr. R. Lawley, gardener to Mrs. Darby, Adcote, taking first and second, and Mr. Meakin third. In Apricots Mr. Pearson, Mr. C. Flock, and Mr. Owen, Combermere Abbey, were the successful exhibitors. The Plum classes were excellent, and as usual Mr. Blair, gardener to the Duke of Sutherland, Trentham, was first in both classes; Mr. Lockie, gardener to G. O. Fitzgerald, Esq., Oakley Court, Windsor, following in both; Mr. Pye, Eline Hall, and Mr. Thomas Brown, The Column, Shrewsbury, being third in the different classes.

The Melons in each class numbered over two dozen, and some very handsome fruits were staged. Some were unnamed, an omission, and the prizes in the green-fleshed class were secured by Mr. J. Cravin, Mr. C. Flock, and Mr. J. Bennett, The Rug, Corwen. In the scarlet-fleshed class, Mr. Owen, Mr. Bennett, and Mr. J. Bates were the prizewinners. Considering the season the Morello Cherries were good, and so were the collections of six dishes of hardy fruits, Mr. Owen being first with samples of Apples, Pears, Cherries, Currants, Red and Black, and Gooseberries; Mr. Pearson second, and Mr. Lambert third. Mr. Adnitt, one of the respected Hon. Secretaries, evinces the liveliest interest in the arranging and success of the fruit classes, and he is to be congratulated on accomplishing the work admirably. We might further remark that Pine Apples are not included in the prize list, and this is an omission that should not exist at such an important and high-class fruit show as is now annually secured at Shrewsbury.

VEGETABLES.

These increase in numbers annually, and the general high quality was much remarked on at this Show. The collections were specially numerous, and made a very grand display. The leading collection was that for twelve varieties, and Mr. Lambert secured the first prize of £5 with a dozen dishes, even in quality and high in cultural points. They consisted of Mammoth Kidney Bean, Matchless Carrot, Lyon Leek, Globe Artichokes, Banbury Onion, Telegraph Cucumber, Duke of Albany Pea, Perfection Tomato, Clarke's Red Celery, Snowball Turnip, and Sutton's Seedling Potato. Mr. Milner came second, uniform good quality being conspicuous in his dishes. Mr. Wilkins, gardener to Lady Theodore Guest, Enwood, Henstridge, Blandford, was third, his dish of Ailsa Craig Onion being unique. In consideration of eleven collections being in competition, the Committee gave two additional prizes, and these were secured by Mr. Wait, gardener to the Hon. W. P. Talbot, Glenhurst, and Mr. A. J. Skinner, Cheltenham. In the collection of six kinds of vegetables confined to the county of Salop, Mr. Lambert came first, Mr. Milner second, and Mr. H. J. Corfield, Seaton Knolls, third, each staging excellent produce. Mr. Lambert was first for six sorts of Potatoes, with Miss Fowler, Chiswick Favourite, The Dean, Reading Russet, Prime Minister, and Abundance. These were not so large as some, but clean and uniform throughout. Mr. Milner came second, and Mr. W. Palmer, Thames Ditton, third. Mr. Abel Lowe won first for three dishes of Potatoes, Mr. Milner second, and Mr. Lambert third. The Colonel from Mr. Milner was first in the single dish class, Mr. Lambert being second and Mr. Corfield third.

Of Tomatoes many fine dishes were staged, Mr. Arkell, Cheltenham, securing first prize with fine, big, round, smooth fruits of Webb's

Sensation; Mr. E. Osborne, Chester, being second with Sutton's Perfection, and Mr. Waite third. Some of the Peas were too old, but many were in good condition, and Mr. Owen was first. In Spring Onions Mr. Lockie was first with Improved Reading, and he also secured the first place for those sown last autumn. In Cucumbers too Mr. Lockie far out-distanced all competition with a brace of his New Perfection, which were models. The first-prize Cauliflowers from Mr. Corfield were of medium size, white, and good in quality, as were also those from Mr. Lambert that were second, and indicated that exhibitors can do little in prizetaking with badly coloured loose specimens, however large they may be. Some of the Celery cut up badly, but the prize heads were clean and sound, the first from Mr. Bremmell being named "White Gem," but it was much too large to be that useful little variety. Mr. Wilkins came second, and Mr. Farrant third. Kidney Beans were numerous, Mr. J. F. Lowe, The Mount, Shrewsbury, being first with clean young specimens, and the Parsnip, Carrot, and Turnip classes were well filled. It was here, as in the fruit department, that practical growers crowded and discussed the many points bearing on old and new varieties, and we were glad to find this section so admirably filled.

SPECIAL PRIZES.

These were offered by Messrs. Sutton & Sons, Reading, and Messrs. Webb & Sons, Wordsley, Stourbridge. In the class for one specimen of Sutton's Empress, Imperial Green, Scarlet Invincible or Hero of Lockinge Melon, twenty-two fruits were staged, Mr. Wright, Ross, being first with Imperial Green; Mr. Craven second with Scarlet Invincible; and Mr. C. Flock third. For two Cucumbers, to consist of Sutton's Improved Telegraph or Purley Park Hero, Mr. Lockie was a good first with the latter, Mr. J. J. Morris second, and Mr. Arkell third. Splendid dishes were staged in competition for nine fruits of Sutton's Perfection Tomato, Mr. Waite being first with a grand sample, Mr. Arkell second, and Mr. Osborne third, but the largest fruit was passed as being too ripe. For six of Sutton's Early Gem Carrot some excellent short thick roots were staged, Mr. Abel Lowe being first, Mr. Davies, Leominster, second, and Mr. Wilkins third with the largest roots, but disposed to be coarse. There was also a large competition for Messrs. Sutton's Peas, and the competition these special prizes created was most encouraging. In coming to Messrs. Webb's specials, the first of £5 offered for eight kinds of vegetables, brought out fourteen collections that made a telling display, and here again Mr. Lambert was to the fore with his clean, even, well grown produce. His dishes consisted of Stourbridge Marrow Pea, Globe Artichoke, Lion Leek, Giant Cauliflower, Runner Bean, Stourbridge Glory Potato, and Parsnips. Mr. Wilkins was a close second, his Ailsa Craig Onions being again conspicuous, as were his Sensation Tomato and White Celery. Mr. Corfield was third, Mr. Lockie fourth, and Mr. Milner fifth.

The cottagers had a tent 140 feet in length and 40 feet wide devoted to them, but this, although sufficient for all in former years, was totally inadequate this year, and many of their exhibits had to be put in another tent, and some on the grass in the open. As indicating the extent of the classes, there were 113 dishes Onions, 53 dishes of Carrots, 47 trios of Cabbage, 59 pairs of Vegetable Marrows, 46 half-dozen of Parsnips, 76 dishes of Peas, and 67 dishes of Potatoes staged. Other classes were equally well filled, and the quality generally was of a very creditable character.

MISCELLANEOUS.

Local and distant nurserymen were large exhibitors of their general produce and specialties, and as in other sections the Show is annually extended in this direction. Mr. E. Murrell, Shrewsbury, exhibited a fine group of ornamental foliage trees and fruit trees in the open, and beautiful stands of Roses, Gladiolus, Dahlias, Begonias, &c.; Mr. Davies, Begonia Nurseries, Yeovil, Somerset, a magnificent lot of blooms of this popular flower; Messrs. Cheal & Sons, Crawley, stands of cut single and double Dahlias, remarkably well coloured. Messrs. Jones & Sons, Shrewsbury, had an extensive display of Ferns, &c.; Messrs. Laing and Mather, nurserymen, Kelso, N.B., many handsome spikes of Hollyhocks in full bloom, and in such vigour as is rarely seen nowadays, and upwards of a dozen large boxes of Carnations and Picotees. Messrs. Dicksons, Limited, Chester, filled a long table with a healthy group of stove and greenhouse plants, cut Roses, Gladiolus, and a sample of their new wood shavings for fruit packing. Messrs. Pritchard & Sons had very extensive collections of useful plants; Messrs. W. & J. Birkenhead, Sale, Manchester, a large group of various kinds of Ferns; and the Liverpool Horticultural Company (John Cowan, Limited), an exceedingly attractive collection of some hundreds of young Tea Roses in 6-inch pots in full and profuse bloom, and various samples of floral decorations; Mr. A. Myers, Shrewsbury, was also an extensive exhibitor of nursery plants; and Messrs. Webb & Sons, Wordsley, Stourbridge, had a large and effective stand, containing good samples of their new and popular vegetables and flowers.

THE WILTS HORTICULTURAL SOCIETY.—AUGUST 22ND.

THIS Society held its annual Show of plants, fruits, flowers, and vegetables in the Bishop's Palace Grounds, Salisbury, on the above date, and on the whole it may be considered up to the standard of any of the many excellent shows previously held by the Society. The weather was very ominous in the morning, but it improved as the day advanced. The takings at the gates, however, were £23 less than last year. The principal exhibitors of plants were Messrs. Cypher, Lock, and Wills, the renowned Cheltenham, Crediton, and Southampton growers; Messrs. Ward, Inglesfield, Evans, Warden, and P. Davidson being the chief exhibitors in the fruit classes.

The Committee, and its energetic and very courteous Hon. Secretary (Mr. W. H. Williams), together with the exhibitors, may all be congratulated upon the arrangements of the Show, and the quantity and quality of the exhibits.

Plants (open classes).—Fifteen pounds, ten pounds, and five pounds were offered for twelve stove and greenhouse plants, distinct, six foliage, and six flowering; and, as on previous occasions, the exhibits staged in competition for these prizes formed the chief feature of the Show. The contest between Mr. James Cypher and Mr. George Lock was a keen one, but chief honours were accorded to the Cheltenham collection. This consisted of large and densely flowered plants of Bougainvillea glabra, Ericas Austiniana and Marnockiana, Clerodendron Balfourianum, Ixora Frazeri, and Phcenocoma prolifera Barnesi, and large and well-coloured Crotons Queen Victoria and Sunset, the latter being an especially bright foliaged plant, the other plants being Cordyline indivisa, Dasylirion acrotrichum, Latania borbonica, and Cycas circinalis, all being in fine condition. The best plants in Mr. Lock's excellent collection were Croton Williamsi, C. Warreni, and C. Chelsoni, Ixora Duffi, Latania borbonica, and Cycas circinalis. Mr. E. Wills, gardener to Mrs. Pearce, Southampton, was a creditable third. In the class for nine stove and greenhouse plants, four in bloom and five in foliage, Mr. Lock was placed first with good fresh plants, showing a richly coloured Croton Disraeli, Kentia Fosteriana, Thrinax elegans, Erica Marnockiana, Dipladenia Brearleyana, Allamanda Hendersoni, Clerodendron Balfourianum, and Dasylirion acrotrichum. Mr. Wills was a very good second; Mr. Curry, gardener to Colonel Pepper, Milford Hill, Salisbury, was third. Mr. Wills was also first for six exotic Ferns with large fresh examples of Microlepia hirta cristata, Adiantum Cardiochleana, Davallia Mooreana, Nephrolepis davallioides furcans, Cibotium spectabile, and Phlebodium glaucum. Mr. Fred. Smith, gardener to the Lord Bishop of Salisbury, was a good second, and Mr. Curry was third. Mr. Thornton, gardener to Mr. Greenwood, Harnham Cliff, Salisbury, had the best six plants of Tuberos-rooted Begonias with remarkably fresh and well-flowered plants; Mr. H. W. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, being a close second. Mr. E. L. Brown, Portland Place, Fisherton, Salisbury, had the best six Fuchsias.

Groups.—Groups of plants arranged for effect in a semicircle 12 feet in diameter have, during the last two or three years, become one of the leading features in this Society's Shows. Out of several good arrangements Mr. George Lock was awarded premier position, his group being so light, graceful, and well finished as to leave little to be desired. The centre was formed with a light feathery Palm, with long trailing shoots of Dipladenia Brearleyana, showing to advantage their beautifully coloured flowers among the Palm leaves, the effect being greatly enhanced by several well flowered plants of Liliun auratum underneath. The groundwork consisted chiefly of Maidenhair Fern dotted at irregular intervals with Oncidiums, Crotons, Liliuns, Palms, Ixoras, Francoa ramosa, Pandanus Veitchi, Phyllanthus nivosus albus, &c., the whole being fringed with small plants of Panicum variegatum, Isoplepis gracilis, &c. Mr. Wills was a good second, his "dot" plants being a little too close, but the general effect was excellent. Mr. Curry was third. The first prize in this class was given by the President of the Society, the Earl of Radnor. Mr. Lock was again first with a similar group to that described in the class confined to gentlemen's gardeners. The competition in this class was not so keen as in former years, but the arrangements were quite as good, if not better, Mr. Wills being, as in the open class, a capital second. The first prize of £5 in this class was given by Messrs. Keynes, Williams & Co., Salisbury. In the class for groups (open to amateurs residing within a radius of six miles of Salisbury) arranged for effect, in semicircle of 10 feet, Dr. F. W. Coates, Salisbury, was a good first, winning the cup, value £5, given by the Mayor of Salisbury (Mr. S. Parker). Several specimens of Orchids were used with effect in this well finished group. Mr. E. L. Brown was a creditable second, and Mr. Lovibond a fairly good third. In the next class, in which exhibitors in the three previous classes were not allowed to compete, Mr. F. E. Pearce, High Street, Salisbury, was a good first; Mr. Hinxham, gardener to H. G. Gregory, Esq., Salisbury, was second, and Mr. Thornton was third. Messrs. E. L. Brown, J. W. Lovibond, C. W. Gater, J. E. Nightingale, A. Mapple, and Thornton were the winners of several prizes in other plant, fruit, flower, and vegetable classes.

Fruit.—On the whole fruit was shown well; the class for Muscat Grapes was the best we have seen at provincial shows for some time. Five good collections of eight varieties were staged, Mr. H. W. Ward being a good first, staging Muscat of Alexandria and Madresfield Court Grapes, Longford Gem Melon (the result of a cross between Hero of Lockinge and Blenheim Orange), Sea Eagle Peach, Pine Apple Nectarine, Cayenne Pine Apple, Brunswick Figs, and Moor Park Apricot—a good all-round lot. Mr. Evans, gardener to Lady Ashburton, Melchet Court, Romsey, was second, his best dishes were very fine Barrington Peaches and Brunswick Figs. Mr. Inglesfield, gardener to Sir John W. Kelk, Bart., Tedworth, Marlborough, was a very good third, his collection including fine bunches of Muscat of Alexandria and Black Hamburg Grapes, and excellent Walburton Admirable Peaches. Mr. G. Lock was first for a good Cayenne Pine, Mr. Ward being second with the same variety, and Mr. Miller, gardener to W. H. Long, Esq., M.P., Roode Ashton, Trowbridge, was third with a Queen. Only three fruits were staged. Grapes.—Seven good stands of three bunches each of Muscat of Alexandria were staged, the bunches being large and shapely, and fairly well coloured. The prizes were awarded to the smaller and better coloured bunches, staged respectively by Mr. Thomas Northeast, gardener to Mrs. Torrence, Norton Bavant, Warminster (an

old pupil of Mr. H. W. Ward's); Mr. Warden, gardener to Sir F. H. Bathurst, Bart., Clarendon Park, Salisbury; and Mr. P. Davidson, gardener to Lord Wolverton, Iwerne Minster, Dorset. The three bunches on one stand, which was not placed, weighed nearly 12 lbs. Five stands of Black Hamburgs were put up. Mr. G. A. Inglefield was first with compact well-finished bunches, consisting of large sloe-back berries; Mr. P. Davidson being a good second. Mr. James Chalk, gardener to G. Road, Esq., Westwood, Salisbury. Mr. H. W. Ward was first for three bunches of any other white than Muscat of Alexandria, with bright clean examples of Buckland Sweetwater; Mr. Warden being a very close second with the same variety; the third prize going to Mr. Thomas Wilkins, gardener to Lady Theodora Guest, Inwood House, Henstridge, Dorset, with rather green Foster's Seedling. In the any other black than Hamburg class Mr. P. Davidson was awarded first prize for three handsome bunches of Black Alicante, carrying a fine bloom; Mr. Warden being only accorded second position for three average-sized creditably coloured bunches of Madresfield Court; Mr. Chalk taking third prize with Gros Maroc, not very well coloured for that variety. Mr. Ward had the best flavoured Melon in Hero of Lockinge, and Mr. Inglefield the second best in a good fruit of Golden Perfection. Mr. Inglefield had the best dish of Peaches, showing large uniform fruits of Walburton Admirable, Mr. Wilkins being second with smaller but highly coloured fruits of Sea Eagle. Mr. Ward scored a victory with Nectarines with large highly coloured fruits of Pine Apple, Mr. Inglefield following closely with the same excellent variety. Mr. Browning, gardener to Sir Talbot Baker, Bart., Ransome, Blandford, was first for six large clean, bright fruits of Moor Park Apricot; Mr. Hains, gardener to the Hon. Duncombe Pleydell-Bouverie, Coleshill House, Highworth, was second; and Mr. Ward was third with the same variety. Out of nine dishes of Plums staged Mr. Ward was easily first with large well-ripened fruits of Guthrie's Gage; Mr. Smith was second, and Mr. Browning third with fruits of the old Green Gage. Mr. Smith was first for six dishes of Apples, three dessert and three culinary varieties, showing clean, even fruits of Irish Peach, Worcester Pearmain, Duchess of Oldenburgh, Ecklinville Seedling, Lord Suffield, and Warner's King. Mr. Browning was second, showing, in addition to three of the varieties just mentioned, good fruits of Cellini, Kentish Fillbasket, and Devonshire Quarrenden. Mr. Thornton was third. For four dishes of Pears, distinct, the prizes went to Messrs. Browning and Warden in that order. The best dishes in the first prize collection were Williams' Bon Chrétien, Louise Bonne of Jersey, and Beurré Diel. Mr. E. L. Brown showed (in the amateurs' classes) two dishes of remarkably large, even, handsome, and well-coloured Barrington Peaches, which attracted a good deal of attention from visitors. Mr. H. W. Ward showed, not for competition, two stands of Golden Queen and Gros Maroc Grapes in good condition, and two large well-netted Melons, Longford Gem. Golden Queen is a fine looking Grape.

Vegetables.—There was only one class provided in the Society's schedule for vegetables for gentlemen's gardeners—namely, for a collection of twelve kinds, and rarely have we had the pleasure of seeing four such collections. Mr. J. W. Thomas Wilkins was awarded first prize for fine examples of the following:—Carters' Autumn Giant Cauliflower, Suttons' Perfection Tomatoes (large, smooth, round, even, and highly coloured fruit), Carters' New Intermediate Carrots, Rousham Park Onions, Carters' Jubilee Runner Beans, large specimens of Carters' Holborn Model Leek, Globe Artichokes, and Tender-and-True Cucumbers, the whole being most tastefully set up in a groundwork of beautifully curled Parsley. Mr. Haines was a close second, his collection containing remarkably good specimens of Carrots, Tomatoes, and Onions; Mr. Inglefield's excellent collection taking third prize. This contained wonderfully fine specimens of Potatoes, Turnips, and Onions. The fourth collection was staged by Mr. Pope, gardener to the Earl of Carnarvon, Highclere Castle, Newbury, Berks, who was most deservedly awarded an extra prize.

Cut Flowers.—Several good stands of these were shown. The prizes offered for eighteen and twelve trusses, distinct varieties, brought out good competition. Dahlias were also well shown, but Roses were not particularly good. For twenty-four Roses, distinct, Mr. Flight, Winchester, was a good first, Madame Lambert, Marie Van Houtte, A. K. Williams, and Duke of Connaught being his best blooms. Dr. D. Seaton, Bitterne, Hants, was second, and Mr. Warden a good third. Mr. W. H. Fowler, Claremont, Taunton (a gentleman who is likely to be heard of in the future Rose and Chrysanthemum shows) was a good first with twelve blooms, the latter being solid, even, and fresh. Mr. R. West, Northlands, Salisbury, was second, and Mr. Smith was third. In the Dahlia classes Mr. Flight, Mr. Browning, and Mr. Haskins (Salisbury) were the most successful. For eighteen bunches of cut flowers Mr. Lock secured premier position, Mr. J. Evans was second, and Mr. W. Peel gardener to Miss Todd, Shirley, Southampton, was third, the first and second named exhibitors showing choice flowers in their respective stands. For twelve bunches the prizes went to Messrs. Browning, G. A. Inglefield, and J. Wilkins, in that order. In the class for eighteen Carnations or Picotees, not less than nine varieties, Mr. W. H. Fowler scored another victory, showing bright, fresh, and in some instances large blooms. Mr. E. L. Brown and Mr. H. J. Gibbs, Salisbury, were second and third respectively. In the ladies' classes Miss Mattie Brown, Miss Flight, and Miss Prewett, Miss Lovibond, Miss Hickley (Taunton), and Miss Catherine Brown were the most successful with dressed stands, buttonholes, shoulder sprays, &c.

Miscellaneous Exhibits.—Several imposing stands of Roses and Dahlias—covering the staging on one side of one of the three large tents

devoted to the exhibits—were staged, not for competition, by Messrs. Keynes, Williams & Co., who also arranged a magnificent bank of Palms, Gladiolus, and Dahlias. Numerous exhibits were contributed by Messrs. Robert Veitch & Son of Exeter, of Japanese Maples, &c. The Carnations, Gladiolus, and Shirley Poppies included in the Exeter contribution were also greatly admired, as also were the fine stands of herbaceous flowers staged by Mr. B. Ladham, Shirley Nursery, Southampton, in such a manner as to fully demonstrate their adaptability and utility for house decoration.

FRUIT FORCING.

PINES.—*Suckers from Summer-fruiting Plants.*—These will soon be ready to be repotted. It is well to divide the plants into two lots; the strongest plants should be shifted into their larger pots as soon as ready, employing 10 or 11-inch pots according to kind, affording them a position near the glass in a light airy house, keeping them gradually growing through the winter. The plants so treated will be readily excited into fruit next May or June, and will afford a good supply of ripe fruit in late summer or early autumn. The other plants, suckers from the summer fruiters, not large enough to shift into full-sized pots, winter in the 7 or 8-inch pots, transferring them to the fruiting pots as soon as ready in the spring, which with suckers of Smooth-leaved Cayenne that were started last March, will provide a successional supply of fruit during the winter months.

Rearranging Plants.—This should be done in order to separate the fruiting from the non-fruiting plants, as many of those that were started from suckers of last summer fruiters will have fruit swelling off. Those plants not fruiting will have completed the growth, and should have air liberally for the next six weeks when the temperature exceeds 80°, maintaining the bottom heat steadily at 80°, and all plants well established—i.e., well rooted, should have a bottom heat of 80° to 85°, but recently potted plants, or those not having roots well established in the fresh compost, maintain at 90°.

Plants Swelling their Fruit.—Moderate atmospheric moisture is required for these, admitting a little air at the top of the house early in the morning, so as to allow of any superfluous moisture escaping before the sun's rays act powerfully upon the fruit. Any fruit it is desired to retard should be moved to a rather cool and airy, also somewhat shady house.

FIGS.—*Overluxuriant Trees.*—Planted-out trees in Fig houses not unfrequently grow rampantly, and consequently produce thin crops of fruit. In that case root-pruning may be resorted to and the roots be confined to a border from 3 to 4 feet in width. If the drainage be defective it will be necessary to lift the trees in the autumn as soon as the leaves commence falling and replant in fresh soil. Place in 9 or 12 inches of rough stones or bricks for drainage, and over them a covering of rather rough lime rubbish, using the finer parts for mixing with the compost in the proportion of a sixth to the bulk of turfy loam, and a twentieth of crushed bones. In replanting ram the soil well about the roots, for short-jointed fruitful wood cannot be so well secured by other means than by a solidified compost. The border should be 24 to 30 inches deep. Should the drainage be good it will only be necessary to confine the roots to the narrow border, removing some of the old soil from amongst them and top-dressing with fresh loam with an admixture of lime rubbish and crushed bones as above stated. If the loam be light add a sixth of clayey marl in as finely divided parts as possible; if heavy, a sixth of road scrapings. The proper time to operate in the manner indicated is as soon in late summer or autumn as the foliage gives indications of maturing.

PEACHES AND NECTARINES.—*Earliest Forced Trees.*—The leaves will soon be off, then loosen the trees from the trellis, clean the house, seeing to the needful repairs, and painting of the woodwork and trellis. The mulching and loose surface soil should be removed and fresh loam, with a twentieth part of bone dust and a similar quantity of wood ashes added, affording a moderate watering if the soil be dry. Whatever pruning is required should be done as soon as the house is in order, but if the trees have been properly attended to little work will be required to be performed with the knife. Dress the trees with an insecticide. It is well to wash the whole of the trees by means of a brush with a soapy solution—say 4 ozs. softsoap to a gallon of water, adding a quart of strained tobacco juice, and if there be any scale a wineglassful of spirits of turpentine may be added, keeping it well mixed by frequent stirring. In applying insecticides care should be taken to reach every part, and the brush should be used in such a manner as not to injure the buds. Trees cleaned and neatly secured to the trellis look far better than those left untrimmed until the latest period before starting.

Late Houses.—The fruit is swelling well and requires very liberal supplies of water until the ripening is well advanced, when moderate supplies will be sufficient; enough, however, should be given to maintain the foliage in a healthy state. Trees that are making gross wood, and have a tendency to late growth, should be marked for lifting, an

infallible remedy for indifferent setting and uncertainty of stoning. Any trees that do not ripen the wood well must be reduced at the roots by forming a trench, so as to detach the roots at about one-third the distance from the stem the trees cover on the trellis, doing it about the end of September or as early in October as the fruit is gathered.

THE FLOWER GARDEN.

Propagating Zonal Pelargoniums.—Zonal Pelargoniums have in most instances grown only too well, and have not flowered so freely accordingly. There is no lack, therefore, of cuttings, but owing to the sappy nature of these, more than ordinary pains must be taken in their propagation. The sooner the cuttings are taken the better is the prospect of a good strike being effected. No plants are more easily raised from cuttings, but unfortunately their preservation during the winter is not such a very simple matter even with the aid of modern well constructed properly heated structures. The intelligent grower, therefore, not only studies how best to root abundance of cuttings, but is most concerned as to the best methods of storing them through the winter. In any case so sappy are the cuttings that it is advisable to resort to the old method of spreading them, after they are duly trimmed, in the sunshine for a few hours in order to get rid of superfluous sap, and to dry the wounds. Nor after the cuttings are once inserted in boxes, pans, or pots should they be exposed to all weathers, a saturated soil proving fatal to innumerable sappy shoots. All should be placed in a sunny position under glass and given plenty of air, but no water more than is necessary to prevent their shrivelling badly. At no time during the autumn and winter months ought they to have more than sufficient to just keep them alive and plump, late formed growth being less hardy and more liable to damp off wholesale.

Pots versus Boxes.—Where extra large numbers of Zonal Pelargoniums are annually bedded out there is the greatest need for striking and storing them rather thickly in shallow well drained boxes, but in most instances it will be found that a much greater percentage of young plants can be preserved during the winter in comparatively small pots. When once a mass of soil in a box becomes very wet it does not become dry again for a long time, and this is the most frequent cause of numerous failures. When, however, the cuttings are inserted rather thickly in small pots, or say as many as six in a 4-inch pot, these rarely get too much water, and all usually turn out strong in the spring. The least that can be done in that direction is to give all the delicate bronze, golden, and tricolor varieties the benefit of small pots, and other conditions being favourable, very few indeed will be lost. Small pots or any size up to 6-inch pots, in every case well drained, may be filled with light sandy soil, and after the cuttings are firmly inserted in them place them on suspended shelves in Peach houses, and the high back shelves as well as the front staging in vineries, where they are to remain all the winter.

Planting Choice Narcissi and Daffodils.—In many instances those who ordered bulbs of these early, or while yet many were in flower, have already received the dry bulbs, and the inexperienced, especially, are at a loss to know what is best to be done with them. As a rule, the sooner the bulbs are planted the better, and they pay for any little extra trouble taken with them. They ought to be planted where they need not be disturbed for several years, or till such time as they are too thick and require to be lifted and divided. For several reasons they should be planted in clumps of three or more bulbs, and if the natural soil is very poor, a little sandy loamy compost may be substituted with advantage. All ought to be planted fully 6 inches deep, and be duly labelled. It will be found that Daffodils especially succeed admirably among trees, a little shade benefiting them rather than otherwise; the herbaceous border, however, being a good locality for the choicer varieties of both Narcissi and Daffodils. The very popular Narcissus poeticus, or Pheasant's Eye, does not move well in a dry state, but if lifted, divided, and replanted soon after they have commenced to root freely, all sufficiently strong will flower in due course, and also increase in size considerably.

Snowdrops.—These again are much best left alone where they are well established, but if dry bulbs are obtained these should be planted either in patches or drills at once, and about 2 inches below the surface. Old clumps may safely be lifted and partially divided directly the points of the leaves are seen through the soil, this having no ill effect on their flowering.

Lilium candidum.—It is not advisable to often disturb these, but if necessary, the clumps may be lifted, divided, and replanted now. During the past season disease has played great havoc among the stock of plants in numerous gardens, and for this there is no remedy—all alike, and under various conditions, suffering from it. A good depth of fresh loamy soil best suits it, the bulbs being placed just below the surface and good care taken of the leafy top growth. It is wonderfully effective in clumps at the back of an herbaceous border, and is very serviceable in a cut state.

PLANT HOUSES.

Azaleas.—These plants are trained as pyramids and into other shapes in the majority of gardens. Although we do not admire closely trained formal specimens, it is necessary to keep them in good condition where they exist. Tying and training are often work for the winter months, but it is a mistake to defer this operation till so late in the season. When the shoots are tied in at that period of the year the plants very rarely display their flowers to the best advantage. After the buds are set tying should be pushed forward from time to time and

completed as early as possible. This allows of the shoots turning outwards again to the light, and thus show their flowers to advantage. The plants in addition are neater over a much longer period, in fact the majority of the ties are concealed by the foliage. Before they are tied in closely, however, carefully inspect the plants, and if any trace of thrips can be found wash them thoroughly in a solution of tobacco water in which about half an ounce of softsoap has been dissolved to each gallon of the mixture. A piece of common washing soda the size of a cob nut may also be dissolved in the same quantity. Assist later plants to complete and ripen their wood as quickly as possible, and all shade should be discontinued after the flower buds are set. Keep the plants liberally supplied with water, use the syringe twice daily when fine, and give abundance of air. Where plants have been stood outside prepare for housing them.

Greenhouse Rhododendrons.—Do not stand these outside after the completion of their growth, for if they become saturated by heavy rains more harm than good is done. When plants have completed their growth do not syringe them, and maintain a slightly drier atmosphere until it is certain that the flower buds have commenced swelling. The syringe may then be used freely to keep down thrips, the greatest enemy to these plants. This insect is readily detected, for it rarely attacks the under side of the foliage. The smaller growing forms are more subject to it than those that make strong leathery leaves. Be careful not to allow these plants to become dry at their roots, and, on the other hand, do not overwater them. Admit abundance of light to harden and ripen their wood, and keep the plants standing on a moisture-holding base.

Lapagerias.—Thrips generally appear at this stage of the plant's growth—that is, when growth is completed and the flowers are showing. If the plants are not thoroughly cleaned now very little can be done as the flowers commence opening without injury to them, especially in the case of the white form. Syringe the plants for the eradication of thrips with tobacco water.

Abutilons.—Strong plants in 5 and 6-inch pots may be placed into others 2 and 3 inches larger. The white form is very useful for wreaths with the yellow nipped out. Plants potted now and grown from the middle of September in a temperature of 60° will continue to grow and yield flowers throughout the winter. It is important to give the plants moderate root room when required for this purpose. They do well in loam, one-seventh of manure, and a little sand.

Tuberose.—Tubers that were potted late and have since been grown under cool airy treatment will be showing their flower stems. These may be introduced, according to requirements, to some structure that can be kept moderately close to bring them into flower. The flowers are useful from the end of September for a variety of purposes, and a succession with care can be maintained for a long time by the introduction of a few plants at intervals of a fortnight. Give weak stimulants directly the flower stems are visible.

THE BEE-KEEPER

EXPERIENCES AT THE HEATHER.

As I previously reported the quantity of honey gathered between the 24th July and 1st August, I need say no more about that than it necessitated me being in constant attendance. I went to the moors on the 9th of August, where I am still, and likely to be till the end of the month, owing to the bees persistently swarming.

THE FIRST SWARM.

This issued a few minutes after my arrival, and while I was preparing to leave them, and would have been lost had I not delayed a little to write a letter upon the door of a passing cart, which the driver undertook to post, when the issuing swarm annoyed the horse. That betrayed their actions and caused me to cut short, so that the animal could get out of the way, as it was with deep regret I read the account of persons in charge of bees being stung and a valuable horse stung to death through carelessness.

WHO IS TO BLAME?

I have repeatedly warned bee-keepers against sending bees to the moors by cart or rail imperfectly secured. I have also shown how hives should be constructed so that no mishap could possibly occur, alike securing bees, man, and beast from injury. All the years I have taken bees to the Heather no accidents of that kind have happened. So far as I can judge the mishap alluded to occurred through the wedges that hold the floor close to the hive—a very defective arrangement; and yet this contrivance was much boasted

of, and prizes were awarded hives because of it. Doubtless, had men of experience been chosen as judges such hives would not have been awarded a prize, and such calamities would not have occurred; and more, had this rule been adhered to, societies that are sunk below zero would have been flourishing and useful. But to my subject.

THE CLIMATE.

This is perhaps the most invigorating and health-restoring to invalids in Great Britain. I have had much experience in this, and since my first article appeared in this Journal on the subject many visitors and tourists are resorting to it. Houses are scarce, but the ground is cheap, and a railway is surveyed for between Elvenfoot and Leadhills.

THE FLORA.

This is varied; every flower we find yields honey, and some of them abundantly. I have read the criticisms of several persons on honey-yielding plants, who no doubt thought themselves qualified to do so, condemn Sweet Alyssum as a bee flower. Here it not only yields honey most abundantly, but the florets are more like those of Candytuft than the Sweet Alyssum that grows with us.

THE SOIL

Appears to be varied, but a large portion of it is evidently that from the rocks, and is stony. There is also peat, but I am not geologist enough to describe it further than there is the slate formation, and gold, and silver, and lead, while Whin is most prominent. As some plants and flowers grow here vigorously I thought the soil would be suitable for pot plants, but the gardener whom I asked for this information could not give it, though he showed me in his collection of Begonias a seedling of a crimson colour measuring 5 inches in diameter.

HIVING THE SWARM.

Having prepared myself with supers and tools for manipulation only, having no hive I undid the screws and opened the hive, destroying all queen cells, then added two supers to the two already nearly filled, hived the swarm in them, and immediately replaced them. This hive swarmed because of the deposition of the old queen, as is oftener the case than some imagine, and not for want of room. It went to work vigorously, and has its four octagon supers well filled, from 20 lbs. to 22 lbs. each. This is not bad considering the unsettled state of the weather since the 7th of July, and it is now the 26th of August, the first settled morning we have had. Had the weather been fine I doubt not but good hives would have risen in weight 200 lbs. or more. As it is some of them are already nearly 100 lbs. heavier. The bees never ceased working while it rained if calm, but being at a high altitude wind often prevailed. The heavy rains reported elsewhere we almost escaped.

HONEY PROSPECTS.

We hear from various sources that the Heather honey harvest is a failure. I have been more fortunate, although I have only half of my hives at the Heather. The bloom lasts here longer than on any moor I have witnessed, six weeks will not exhaust it. The Clover harvest has not been a success everywhere, but we hear of one bee-keeper in Invernesshire who has 1044 lbs. from very few hives, but the number is not stated.

THE OCTAGON HIVE.

I have throughout the year endeavoured to relieve my mind of the belief that the octagon or Stewarton hive is superior to any other, but cannot. It wintered best, swarmed first, and has given the most supers, and I must therefore stereotype it as the best hive for those who keep bees for honey for their own use, the squares being best for producing small saleable supers.

HONEY GATHERED.

This will perhaps astonish some readers. There are several things, however, that must be explained; the pasturage is good

and honey-yielding, the hives are favourably situated, strong in bees, which are foreigners. On the evening of the 12th August I was assisted to weigh two hives; one was 92 lbs., the other 122 lbs. in weight. On the following evening at the same hour the first mentioned weighed 125 lbs., gathering a total of 33 lbs. on one day, the greater part of it being showery. This is, perhaps, as high a record as has ever been made in this country. We did not weigh any more of them owing to their height and weight, or even a greater result might have been discovered, as this hive was not the heaviest. It is a crossed Syrian. A much heavier hive, a crossed Cyprian, stands by the side of it. I am glad to say my experience at the moors has been interesting to me, and trust I may have something to say both interesting and instructive to bee-keepers in future issues.—A LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

E. H. Krelage & Son, Haarlem, Holland.—*Catalogue of Dutch Flower Bulbs*, 1889-1890.
Seeger & Tropp, 112, Lordship Lane, East Dulwich, London, S.E.—*Catalogue of Orchids*, 1889.
Dickson, Brown, & Tait, 43 and 45, Corporation Street, Manchester.—*Catalogue of Bulbs*, 1889.
Webb & Son, Wordsley, Stourbridge.—*Bulb Catalogue*, 1889.
G. Shrewsbury, 122, Newgate Street, London.—*Illustrated Lists of Stoves, Hot-water Apparatuses, &c.*
G. E. Elliott, 97, Bradford Road, Huddersfield.—*List of Bulbs, Roses, &c.*
Fisher, Son & Sibray, Handsworth Nurseries, Sheffield.—*Catalogue of Bulbs and Winter Flowering Plants.*
James Yates, Stockport.—*List of Bulbs and Flower Roots.*

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Lavender Culture (*R. M. & Co., Manchester.*).—The information you require is in type, and will appear in an early issue.

Primula (*H. E.*).—Very much depends on the size and vigour of the plants, also on the temperature and position in which they are grown, for having them in the best condition about the middle of November; but you will probably not lose by allowing the flower spikes to extend towards the end of September.

Peaches and Grapes (*Alfred Bishop*).—The Peaches from large trees that were removed last autumn and are heavily cropped this year are very good indeed, one being 9½ and the other 9¼ inches in circumference, and the quality of both excellent. The Grapes from Vines formerly weak, the crops shanked and the berries not coloured, are also satisfactory. The berries are above medium size, and we suspect no fault has been found with either their colour or quality at the dessert table. We shall be glad to receive the account of your treatment in improving the trees and Vines you are good enough to offer to prepare for publication. We readily afford space for details of successful practice, as they are of service to many readers.

Withered Tomato Leaves (*E. M. B.*).—When such soft leaves as Tomatoes are wrapped in dry paper this extracts the moisture from them, and they invariably arrive in a condition very different from when they were posted. Those you sent had not a particle of moisture in them, but could be crumbled like dried herbs. There appear indistinct remains of fungus similar to that which attacks Tomatoes, but

generally the leaves appear as if the plant were in an exhausted state. Cut off useless and affected leaves, and dust the remainder with sulphur, and we do not think you need be under any apprehension of anything injurious passing from the Tomatoes to the fruit trees. If you would like us to make a further examination we are quite ready to do so if you send leaves packed in newly cut grass, so that they reach us as fresh as when cut; also state whether the plants are in pots or planted out, with a brief record of your treatment. We are convinced that half the evils to which Tomatoes are liable are brought about by errors in culture.

Galls on Oaks (S. Bilton).—These are caused by a small fly. The females of these gall-flies (which belong to the order Hymenoptera) are provided with a peculiar apparatus for egg-laying, by means of which they are able to insert one or more eggs with a small quantity of fluid into the part chosen for attack, and thus set up an irritation in the living tissues which causes the diseased growth, resulting in the shape of galls. In the case of the *Cynips Kollar* the egg is laid in the young bud when forming in the axil of the leaf, and the consequence is the globular growth of cellular tissue which we find, with the grub lying in the middle: towards autumn this changes to a pupa, and generally the gall-fly comes out shortly after, but sometimes not until the following year, or possibly even later. It is furnished with four transparent wings; the body and abdomen are of a rusty or ochreous brown, and the base of the abdomen pitchy. As yet females only have been observed.

Insects and Insecticides (E. Wilson).—We can only repeat what we have previously said on this subject, that the various kinds of insecticides as far as we know are all good if rightly used. Nicotine soap, Gishurst compound, Fir tree oil, Lemon oil, used in accordance with the instructions of the vendors, will destroy aphides; but in the interests of safety rain water should be used for mixing purposes. Fir tree oil, for instance, mixed with some kinds of spring water, is injurious to the tender foliage of the plants and trees; but the same quantity mixed in rain water is perfectly safe. A mixture of soft soap and quassia, 2 ozs. of each to a gallon of water, is safe and serviceable, and may be used with great advantage once a week before any insects are visible; it is both a deterrent and destructor, and it is much better to deter than to destroy. Tobacco water is a well-proved remedy, the cheapest and best being the London tobacco juice, which is made from duty free tobacco, in accordance with a special grant, for the destruction of insects.

Grubs in Soil (A. A.).—The grubs of the cockchafer are most difficult to destroy amongst growing crops without at the same time injuring them. The ammoniacal liquor from gas works can be diluted so as not only to be safe but beneficial to vegetation, and at the same time obnoxious to underground pests. The stronger it is the more effectual against these, and the degree of strength the crops will bear can be determined by a few small experiments. In the absence of gas liquor petroleum violently mixed in soapsuds with a little soda is good for the same purpose, and if not too strong acts as a manure that is especially good for Strawberries, and it is in beds of these that you find the grub so destructive. Try the effect of a wineglassful of petroleum in a gallon of soapsuds on a plant or two that may be attacked, thoroughly saturating the ground, and note the result on the plants and grubs. Perhaps the former may endure a stronger application, but it is important that the mixture be briskly stirred at the moment of using. When ground is vacant gas lime is one of the best of applications in clearing off various kind of grubs. It varies in strength considerably according to the time it is exposed to the air, and to be the most effectual it should be used fresh. We have applied it at the rate of a quarter of a pound to the square yard, well mixing it in the soil in digging, not burying it in heaps, with considerable advantage, but should not like to do so within two months of sowing or planting, though we know heavier dressings have been given with safety, and probably with benefit, when the land could have a longer rest.

Raising *Clerodendron fallax* from seed (J. R. S.).—A correspondent some time ago supplied the following particulars of the system he adopted, and they convey the information your require. "The seeds were gathered from an old plant in the autumn, and in the first week of the succeeding March they were sown in a pan and placed in a heat of 60°. The soil used was finely sifted sandy peat. When the seedlings came up (and they were not long in doing so), they were almost immediately large enough to occupy 2-inch pots, and in potting them the same kind of soil was used, with the addition of a few handfuls of silver sand. They were kept in the same place until they were large enough to be shifted into 4-inch pots. When the plants were again established they were removed to a more airy place with plenty of light and shaded from the midday sun, but kept close to the glass. They had a temperature of 55°, with air admitted both at the back and front of the house, air being occasionally admitted all night, according to the weather. They remained in this position up to the opening of the first flower, but they were shifted into larger pots as they required until they were in 8 and 10-inch pots, according to size; these were their blooming pots. At the last two pottings a third of turfy loam was added to the compost, and one-fourth well decomposed cow manure finely sifted, also a few handfuls of charcoal broken fine. This mixture of soil will be found to improve the colour of the foliage and increase the size of the individual flowers. Water the plants plentifully at the root when required, but avoid syringing the foliage in the early part of

the day, or even at any time, as a good moist atmosphere will be sufficient for the plants in the comparatively low temperature in which they are growing. The principal insect enemies are red spider and green fly. The attacks of the former will be best guarded against by moisture in the atmosphere, and never allowing the roots and foliage of the young plants to become dry. For green fly the usual means of destruction by fumigation will answer; this should be particularly attended to just before the first flower opens, because if a few of these insects pass unobserved by the time the flowers expand there will be multitudes of them, and fumigating then will bring off all the flowers which are open."

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (H. J. P.).—*Lycaste Deppei*. (W. Reading).—Your previous letter, with specimen, has not been received. The flower spike you now send is apparently a *Bulbophyllum*, but the material was too imperfect to permit of determination. Send us a portion of the plant if possible.

COVENT GARDEN MARKET.—AUGUST 28TH.

No alteration. Market very quiet.

POINTS OF HUSBANDRY.

To sow Rye Grass, Clover, Lucerne, Sainfoin, and mixed seeds with a corn crop has become a very general custom, but in a wet season the growth of such green crops among the corn becomes so rampant as to prove troublesome at harvest time, and it is worthy of consideration whether a more frequent departure from the rule is not advisable. Clover may perhaps form the exception, for where Clover is sown so extensively as in the eastern counties it is always done with the intention of devoting one growth for seed, and with a favourable weather a full crop of Clover seed is always profitable. The apparent advantage of sowing seeds with corn is that when the corn is harvested there are the seeds established in the soil in readiness for an early start next season. But if seeds are sown alone early in spring they come into use in June and afford an excellent change for ewes and lambs. In Lincolnshire seeds are sown alone after roots, the quantity used per acre being 4 lbs. Red Clover, 4 lbs. Cow Grass, 4 lbs. Trefoil, 1 peck Italian Rye Grass. We may explain that Cow Grass is a perennial form of Red Clover, an excellent forage plant bearing both drought and frost better than the common Red or Broad Clover. With the above mixture is sown 4 lbs. of Rape seed, which at first affords some shelter for the young Clover plant, and is subsequently cleared off by the sheep, the seeds standing over for the second year. When the layers are thus left for two years a five-course shift is followed, and instead of proving exhaustive the plan is highly beneficial, the sheep folding and fibrous roots of the grass affording sustenance to the next crop. In the adjoining county of Nottingham the mixture for two years' layers consists of 1½ peck of Perennial and Italian Rye Grass, 10 lbs. of white Clover and Cow Grass, and a small quantity of Sheep's Parsley (*Petroselinum sativum*), of which sheep are very fond, and it is considered to check liver-fluke and red water.

After a two-years ley a little extra attention is necessary to eradicate couch grass when the ley is broken up, some of this pest being almost certain to be found, and if got rid of then much subsequent trouble would be avoided. Farmers suffer a terrible annual loss from the exhaustion of soil by twitch, and they should be on the alert to do their utmost to eradicate it upon every occasion. Headlands are often a prolific source of twitch and other weeds, and when the condition of the land is at all doubtful it is far better to make a dead fallow of the headlands rather than to crop them. Under the agricultural depression it is notorious how sadly many farms have fallen out of condition, foulness and poverty being the more prominent evils. The cause of this is said to be a want of means on the part of farmers, but it is very questionable if the evil is not owing in a large measure to mismanagement, to a want of timely culture. Now as to foulness, it is certain that the condition of a farm in this particular depends very much upon autumn cultivation, and as was recently suggested, stout boys or lads trained to the work can get through a lot of work with the broadshare, light plough, and harrows upon the stubbles, so that by the time the last field of corn is saved very much of the land might be cleared, of superficial weeds at any rate. An able master will not allow prejudice on the part of workmen to exercise an adverse influence upon his plans, and where the horsemen join the other labourers in taking a full share of harvest work the horses should not remain idle, but should be used in the manner we indicate whenever they are not required for carting corn.

This question of cultivation has several aspects, one of which is the apportionment of a farm to different crops. There is no

doubt that in Essex and other counties of East Anglia most of the farms have been entirely out of proportion, and in this respect a good lesson may be had in Warwickshire and Northamptonshire, where there is plenty of heavy land. In Warwickshire there are farms with the soil entirely of the blue lias clay, wherein excellent corn can be and is grown, yet fully one-half, and in some instances two-thirds of the land is laid down to permanent pasture. See what this means in keeping down labour! About half of such pasture would be laid in for hay, and the remainder grazed. Now we do not advise an effort at sweeping reform by a wholesale attempt at laying down land to permanent pasture, even with the landlord's help; but we are bound to insist upon the expediency of the prompt adoption of a system of alternate husbandry with a large proportion of the land in four-year layers. We have applied this system to a heavy land farm on the borders of Essex, a large quantity of excellent hay has been made, and there are now some 600 "keeping" sheep there, the weekly return for which pretty well pays the labour bill, in addition to which the sheep-folding is steadily tending to enrich the land.

WORK ON THE HOME FARM.

Adverse weather still prevails, and harvest work lags under the depressing influence of cloudy skies and wet days. The whole of our Wheat is cut, and a few stacks are finished, but there is very much of it out in shocks yet, and without a change to settled weather we anticipate a certain proportion of sprouting corn in the sheaves again. Much of the Barley is ripe, and we only want fine weather to save it. The outlook is most serious, for prices at best are low enough, and any depreciation in quality is quite certain to bring them still lower.

A few stubbles have been cleared, and after fallen corn has been eaten by pigs or sheep they should be at once broken up, after any beds of couch grass have been got up with steel forks. One of the best root farmers in the country always has enough of his stubbles prepared for Mangolds in autumn by first getting out any twitch, then a Coleman's cultivator is used along and across it with the grubber tines, four horses being used to it. It is left in a rough open condition for several weeks fully exposed to atmospheric influences; farmyard manure is then put on it at the rate of thirty loads per acre, and ploughed in, the work being finished before Christmas. In spring it is harrowed twice with a heavy drag harrow, after which about 4 cwt. per acre of chemical manure is sown broadcast, light harrows being then passed over, followed by rollers, and then the seed is drilled at the rate of 7 lbs. to the acre. Much depends upon weather, but the plan is to sow by the first or second week in April. We regard 7 lbs. of Mangold seed as the correct quantity. One of our bailiffs was positive about 5 lbs. being sufficient, and generally he is successful in obtaining a full crop, but this year a thin plant on the farm under his care appears likely to convert him to our view of the matter. We hold that it is well that a bailiff should have opinions of his own—aye, even positive opinions about his work, and we avoid all unnecessary interference with an able earnest man who throws himself entirely into his work, and who is certainly worthy of support and sympathy.

REMARKS.

- 18th.—Fine and generally bright.
 19th.—Bright early, cloudy with once or twice spots of rain in the morning; overcast, hazy and oppressive in the afternoon; wet night.
 20th.—Wet till 10 A.M., then generally overcast, but one or two gleams of sun. Gale all day.
 21st.—Cool and generally cloudy morning; heavy shower at 2 P.M., then bright till 5 P.M., and wet evening.
 22nd.—Cloudy early; fine and frequently bright from 11 A.M. to 3.30 P.M., then frequent heavy showers.
 23rd.—Fine and bright.
 24th.—Wet till 11 A.M., then bright till 3 P.M.; heavy rain with thunder and lightning 3.30 to 4 P.M., and fine evening.
 A showery and unsummerlike week. Range of temperature small, the maxima being low, though the mean was but little below the average.—G. J. SIMONS.

DWELLERS in the metropolis are familiar with the itinerant vendors' somewhat plaintive cry, "Sixteen good branches a penny, sweetly blooming Lavender!" and are accustomed to regard it as one of the signs of a waning summer, but few probably give a thought to the extent of the supply needed to meet the demand for the cut flowers or their product in the form of Lavender water. Yet the culture of this plant forms an important branch of horticultural industry, and one that might be considerably extended with advantage both to the owners and occupiers of land. As a garden plant all know how accommodating it is. The driest situation and the poorest soil are assigned to it, yet it annually and for years produces a plentiful crop of its soft tinted fragrant flowers, which are valued not a little in many a cottage home. But there is another phase in its culture of a more important character—namely, the production of flowers in quantity for the market and the distillery. This gives employment to numbers of people, and some of the land so occupied is in favourable seasons, and on the average, much more profitable than that devoted to what may be termed standard crops.

There are some great advantages in favour of Lavender culture, though, of course, there are also some attendant drawbacks. The great point in its favour, however, is that what is ordinarily termed poor land, scarcely fitted for maintaining any other form of vegetation than a scanty crop of grass, suits Lavender admirably, indeed much better than soils of a rich character. The importance of this cannot be overrated, for there are thousands of acres in the southern counties of England, especially in the chalk districts, that might be profitably utilised in the culture of the plant. It is usually grown in low-lying situations and soils that encourage too rapid growth, as though the plant is benefited by a fairly fertile soil excessive vigour is unquestionably injurious finally.

One of the chief defects or disadvantages to be contended with is that where Lavender is cultivated mainly for distillation its success is largely dependent upon the character of the season, more especially upon the two summer months of June and July preceding the period of cutting. In sunless wet summers the yield of oil is greatly reduced, and this is a matter which no skill on the part of the cultivator can overcome. On the other hand, many find that the best results are obtained in pecuniary returns by selling the flower spikes in the market or to private purchasers for drying, as the prices are less influenced by the season except so far as the supply is affected.

Another difficulty is that the plant has an unpleasant habit of dying in pieces, and a field of apparently healthy plants may be reduced to half its former value in the next year. Frost in severe winters has something to do with this, and some of the evil results have also been ascribed to the action of a fungus; but beyond all, failure in this respect is undoubtedly due to want of care in maintaining a succession of young stock, and to planting in too rich a soil. Mr. E. M. Holmes, Curator of the Pharmaceutical Society's Museum, has stated in a contribution to the "Encyclopædia Britannica," that in 1860 much devastation was caused to the Lavender crop by a severe frost, and since that time the plants have been subject to the attacks of a fungus, which has proved so destructive that the growers in some districts have been compelled to discon-

tinue its culture. Market Deeping, in Lincolnshire, which was at one time noted for its Lavender production, is given as an instance of the enforced discontinuance owing to the fungoid troubles. Where, however, the acreage has been reduced in southern counties it seems to be mainly traceable to other causes.

For example—Mitcham, in Surrey, has been for at least a hundred years celebrated for its Lavender, and in all the works of reference containing any particulars on this subject, including the most recent, it is said that the plant is there "cultivated extensively." At our time this was correct, but there has been a considerable change in recent years, for now only a few small plots can be found in Mitcham itself, though the cultivation has been extended greatly in neighbouring districts. The few small patches now seen are of a very unpromising character, the plants seem to be too old, many are in a half-dying state, and they do not receive even the small amount of attention they require in keeping them clear of weeds. It often happens that plants which need the least attention are the most neglected, and this is certainly the case with Lavender in several places. Last autumn a tract of land in a neighbouring district of Surrey, sloping in a northerly direction down to a small stream, was planted with Lavender, and, as might have been expected in so cold and damp a situation, the greater portion was lost during the winter, and the remainder was in such bad condition that it had to be pulled up or ploughed in to make room for other crops. Another field more favourably situated was planted about the same time, and the plants made good progress, but during the present summer the ground has been allowed to become infested with weeds to such an extent that the Lavender is nearly smothered, and quite a season will be lost in its culture.

At one time it was estimated that in Mitcham and the neighbourhood 300 acres of land were devoted to Lavender. I have not been able to ascertain the exact space now occupied, but the falling off at Mitcham is amply compensated by the extended cultivation in Carshalton, Beddington, and Cheam. In Kent also it has received some attention in recent years, while near Cambridge and Hitchin it has been grown for a long period. At the last named place in particular it is said to have been grown for at least 300 years, though it only became of commercial importance in that district during the present century. The total acreage under Lavender has probably increased notwithstanding the fungus attacks, frosts, and adverse climatal influences generally.

The method of cultivation adopted by the more successful growers may be briefly summarised as follows, premising that the systems differ slightly in some districts, that here described being the Surrey practice. It may be observed that the species grown both for flower and perfume is *Lavandula vera*, a native of widely separated districts in Southern Europe and Northern Africa, mostly in stony land and warm situations on the slopes of mountains up to an elevation of 3 to 5000 feet. It is, however, cultivated in Europe in much more northern latitudes, and is reported to thrive even in Norway. Other species of *Lavandula* are grown for the sake of their oil, but their perfume is mostly of a ranker and less agreeable character, and in the case of the oil of Spike mentioned in many old works its use is chiefly in preparing pigments for painting on porcelain. *L. Spica* has long been regarded as a distinct species, but some authorities now consider it as synonymous with *L. vera*.

Lavender can be readily increased by cuttings, but the market garden system consists in dividing the roots of the plants, thus obtaining good sized slips at once with roots attached. These are planted either in autumn or spring, but preferably at the latter time, in rows 18 inches apart and the same distance between the plants, all the preparation needed being digging or ploughing the soil; but it is not necessary that it be much loosened, as the firmer it is the better it suits the plants, provided there is a free drainage for the surface water. The second year after planting every alternate row and each alternate plant in the remaining rows

are lifted and transplanted, so that the permanent crop roots remain 3 feet apart each way. Intercropping with vegetables, or anything that can be quickly removed, is customary in the first year, especially where it is the practice to place out the rooted divisions 3 feet apart at once, thus avoiding the after labour of replanting, though more ground is occupied. In the third and fourth years the plants are in their best condition, yielding the largest number of spikes and the greatest per-centage of oil when the seasons are favourable, but they are often continued on the ground for several years afterwards, and it has been stated that they will yield profitably for ten years. Retaining old plants is, however, one of the mistakes of cultivation, and unless a constant succession of young stock is maintained, rigorously destroying old roots as soon as they give signs of failing, success cannot be expected. A plantation should be made every year, and then no difficulty is experienced in keeping up the supply. To the neglect of this some of the older growers rightly attribute the majority of failures that occur.

Beyond keeping the land free from weeds scarcely any cultural attention is needed, and when at the end of July, or usually early in August, the flowers are sufficiently advanced to commence cutting the bunching is not a serious matter, and the expense incurred in this does not materially reduce the cultivator's profits. The fields have to be gone over several times, as the spikes are not all fit for cutting at the same time, and it requires a little care and experience to select the heads when they are in the best condition, with the majority of the flowers expanded. If they are intended for distillation they are conveyed at once to the stills, where either the flowers only stripped from the stems are employed, which yield the finest oil, or the stalks and flowers are distilled together, and as the oil from the latter is more volatile it is possible to separate the finer from the coarser products by retaining that first distilled over. When to be sold in the market the spikes are bunched and sent in dozens, being gathered when dry, and usually a day or so before they are wanted; thus for Monday's market, when a good quantity is sent in, it is all gathered on the Saturday, and the bunches placed in cool dry sheds. In Covent Garden Market Lavender is re-sold to dealers or retailed by the herbalists in smaller bunches. Frequently also the flowers are stripped from the stems and sold in neat little bags termed lavenderettes, or loose by measure at so much per pint.

The profits to be realised from Lavender culture with good management and moderately cheap land, that with a calcareous sub-soil being apparently the best for the purpose, are sufficient to render it well worth attention, and under favourable circumstances a very substantial return is obtained. Selling the flowers direct seems to be considered more profitable than distilling them, and when £50 per acre can be secured it certainly looks promising considering the small outlay necessary. A healthy plant three or four years old should produce at least fifty spikes, and this would give 2000 bunches of 120 spikes each, and these are sold at 5s. or 6s. per dozen bunches. This is perhaps the best return that can be obtained, just when the plants are in their prime and the weather is fine. The average probably would be scarcely more than 1000 bunches per acre, producing £25, though this ought to afford a good profit. In some bad seasons and from old plantations less still is secured, and one grower has this year only cut about 300 dozen bunches from twenty acres. There is as much difference in the yield and quality of the oil, for this is said to vary from 10 lbs. to 30 lbs. per acre of plants, and the quantity is so dependent upon the weather that it accounts for the growers preferring to sell the spikes as cut unless, as is sometimes the case, they have a still upon their land. There are several large distilleries in this part of Surrey, both at Mitcham and in neighbouring districts, and it is the custom of some of the owners to let the stills to the smaller growers for short periods until they have disposed of their stock.

The use of Lavender for domestic purposes dates back to the time of the Romans, and as it was employed in perfuming baths

the generic name was considered to be derived from the Latin verb signifying to wash. There seems to be some doubt if the true Lavender, *L. vera*, was the plant thus employed; and *L. Stæchas* is probably the species that was most generally known. At one time Lavender was supposed to be the Spikeard of the Scriptures, and Phillips, in his "History of Vegetables" (1822), devotes several pages to an attempt to prove this. Spikenard is now determined to be the product of quite a different plant—*i.e.*, *Nardostachys Jatamansi*, one of the Valerians. It is not known when Lavender was first used in medicine, but concerning its official qualities Dr. Hogg has given a full account in his "Vegetable Kingdom," in which it is noted that *L. Stæchas* "is very fragrant, and rubbed between the fingers it emits the odour of camphor, because its essential oil contains much stearoptine, which is the crystallisable principle of essential oils. It is considered useful in pulmonary affections, also as a good anti-spasmodic." *L. vera* is "bitter and aromatic, tonic, and stimulating to the nervous system." "Lavender drops" consist chiefly of oil of Lavender with oil of Rosemary, Cinnamon, and Nutmeg, coloured with red Sandalwood, and this preparation bearing the name of tincture of red Lavender is recommended as a stimulant and cordial, especially in flatulence, and to some extent as a substitute for sal volatile. Lavender lozenges are used in the same way, but are a milder preparation and a very agreeable confection. In Johnson's "Gerard" (1633) the true Lavender is mentioned as *Lavandula flore cœruleo*, and it is said respecting it, "The flowers of Lavender picked from the knaps, I meane the blew part and not the huske, mixed with Cinnamon, Nutmeg, and Cloves, made into powder and given to drinke in the distilled water thereof, doth helpe the panting and passion of the heart." The principal modern use of oil of Lavender is as a perfume, and mixed with spirits of wine or other ingredients it constitutes the popular Lavender water of the shops, and which perhaps is more largely used than any other form of scent. The oil is said to improve by keeping for two or three years, but after that time it is necessary to add alcohol to preserve its properties. The oil is contained in glands, which are chiefly found on the calyx, the corolla, and the leaves, though they also exist to some extent upon the stems and flower spikes.—
L. CASTLE.

STRAWBERRY GROWING.

SOME little time ago I noticed many of your correspondents had a good word to say for Laxton's Noble Strawberry. They did not say too much in its favour. My garden is very cold and exposed, the soil also being cold and heavy, so that nothing is favourable for obtaining early fruit; but in spite of these drawbacks I was able to gather fruit of Noble on Whit-Sunday, a good week before any other variety. The trusses were very large, and the fruit truly immense, the crop far exceeding that from Sir Joseph Paxton, which I consider far and away the best and most profitable all-round Strawberry. Noble I hear is being largely planted by the trade, and I do not wonder at it, for they would not exhibit their usual acumen if they did otherwise. I was able to obtain 2s. per pound for my earliest Nobles, and the purchasers were delighted with the fruit. No other variety was so profitable, for I obtained a much higher price for the fruit, and the crop was the largest of all. Next to Noble, Sir Joseph was most profitable, carrying an exceedingly heavy crop of handsome fruit, but not so early as the Vicomtesse H. de Thury, which succeeded Noble, and also carried a heavy crop, but the fruit was small, the flavour, however, being the best of all to my taste. To those who are now making their new Strawberry beds I would say, Plant Noble, Vicomtesse, Sir Joseph, and Oxonian to obtain an early, medium, and late crop of good fruit off plants which are all good growers. Laxton's King of the Earlies is certainly very early, and the flavour of the fruit is good, but it is a weak grower, and I do not consider it profitable. Mr. Laxton has now sent out his Latest of All, and if all I hear from a reliable source is true this Strawberry is a very valuable introduction, and should be tried by all those who, like the writer, are anxious to obtain a good thing.

Lucas I do not like, although large. Forman's Excelsior, which was the only reliable cropper on the gravelly soil of Totham, does not seem to appreciate my heavy land here. Sir C. Napier, British Queen, J. Veitch, and others were none of them half so satisfactory

as the four I have named. My crop was the heaviest I ever had, and I attribute it chiefly to my use of artificial manures. So soon as the plants commenced growing they had a good dressing of Jensen's cod potash guano (which I also found excellent for Tomatoes, Potatoes, and pot plants), and when the flowers expanded they had a light dressing of ichthemic guano. Later on, when the fruit was swelling, another application of the cod potash guano was given, the result being a heavy crop, which lasted a long time, for every berry seemed to swell and ripen in due course. I shall treat my plants in a similar way next year, and trust to obtain similar results, in which case to the query "Does fruit-growing pay?" I shall decidedly answer "Yes, if the right sorts are grown and the plants judiciously fed."—H. S. EASTY.

AURICULAS IN SCOTLAND.

So far as my own knowledge goes, and from what my correspondents state, I am warranted in saying that the principal collections of Auriculas in Scotland are now repotted. There cannot be a doubt that the period between the cessation of the plant's active growth and the commencement of the next season's growth is the proper time for repotting. That period seems to be, as a rule, from the middle of July to the beginning of September. The plants being fully at rest they, under the new conditions of fresh soil, begin to establish themselves by sending out strong roots to the sides of the pots. They have ample time before the winter checks the second growth to be firmly rooted, and during the autumn months they require little care besides watering and keeping them clean. The plants this year have been in fine condition and healthy, though with me more of the stems have required cutting-in from the extremity being decayed than is usually the case; but a little charcoal applied to the wound made everything right. The best way to do this is first to dress the wound with powdered charcoal and then place some of it on the top of the cone of earth round which the roots are arranged, and place the end of the stem upon it.

There has been a fair increase this year on most of the varieties, and I am pleased that the new "cracks" have given me a number of offsets. Since repotting all the plants are looking well, and I have good accounts from my Auricula-growing friends of their collections. No appearance of autumn blooms is reported among the plants potted within the last six weeks, but I saw last week a collection which was potted before the 10th June, in which some plants were already showing bloom, and from the appearance of the centres of many more I have no doubt ere long bloom will be plentiful. The plants were as large and as full of growth as they should be at the end of March. Their owner holds the opinion that autumn bloom is of no consequence and does not weaken the spring bloom. Most growers hold an opposite opinion, based on their experience and observation. In repotting it is not necessary to carry out the old direction of keeping the plants shut up closely for some days. The best way is to give them a good supply of water and put them back into the open frame, which of course will look to the north. One grower of an extensive collection this year placed his newly potted plants in a shady place in the open air, where they have received all the recent rains, and they are looking well and growing fast. The Auricula is a hardy plant and does not like so much coddling as some growers give it.

In Scotland this has not been a good year for seed, and even those which I crossed have not given any seed. A large grower recently wrote me that the result of his crossing was the same. I believe green fly has been somewhat troublesome in some collections, but my own plants are so often through my hands that the insects have no time to increase. If a plant is very bad with them I would recommend washing them off with pure water from a gently flowing pipe. Avoid soap and other substances which may close up the pores of the foliage. If properly done the pure water will not leave a single fly on the plant.—J. M., Dundee.

NOTES ON PEAS.

I HAVE been very much interested this week by reading the "Notes on Peas," by "W. S., Frome," in the *Journal of Horticulture*, page 174, inasmuch as in some respects his experiences are a reflex of my own, specially so as to bird depredations, and the peculiar disease he speaks of in the second paragraph of his notes. I wish I could throw some light on the subject. I have tried to get light, and am waiting now for a report from Professor Oliver of Kew on specimens of diseased Peas which I submitted to the Scientific Committee of the Royal Horticultural Society at their meeting on July 23rd. As "W. S." will see by reference to the *Journal of*

Horticulture of August 1st, page 91, the Scientific Committee referred my specimens to Professor Oliver for examination and report, and I am anxiously, very anxiously, waiting for the Professor's report. If "W. S." would not mind sending me specimens of his diseased Peas I could see whether the disease is like that of my Peas, and in return I would send him specimens of mine for his examination. He and I would both be able by this arrangement to see if the disease was the same in both instances, and we should be in a better position to profit by the report, and the instruction which may be in that report, when Professor Oliver publishes it.

The disease is evidently of fungoid origin, and has some analogy, so it appears to me, to the disease in Potatoes, though the Pea disease originates in the earth and the Potato disease in the air. I have had instances of it in my midseason and later Peas for many years, but curiously to say, not in the early kinds. This year, however, it beats the record of any previous year. My Peas are all from a collection I had from Suttons of Reading, and their germination and early growth was all that I could wish. When about a foot high, or thereabouts, the mischief began, and so virulently and speedily did it spread that soon paralysis of growth, yellow foliage, unopened flowers, and eventual death set in. My rows were about 12 or 15 yards long, and in some rows I have had only four or five plants left in the row, and those sickly ones. For instance, Sutton's Satisfaction, which by the way was a perfect satisfaction to me last year, had three plants left in it, Champion six; Culverwell's Telegraph and Prizetaker stood it a little better. Veitch's Perfection I have not had a Pea from, and Sutton's Tall Marrow and Ne Plus Ultra have done little or nothing, there being only some twenty or thirty plants in a row. The effect of all this loss of Peas has put me in a very trying position. Fortunately I have had plenty of other vegetables, but as everyone knows, nothing can quite compensate a gardener for the loss of a crop of Peas. Added to this, the very sight of the sickly rows of Peas has been a daily misery to me, and in addition to the other trials, the birds have been more than usually ravenous, and as for various reasons I cannot use the gun much in the kitchen garden here, they have feasted on my poor Peas to their heart's content and my daily vexation.

As to the cause of the disease I am quite in the dark. The soil here is partly clayey and partly sandy, being on a "fault." The Peas this year are on a piece of the heavier portion, and this portion, lying near to a corner where we rot down yearly the leaves from shrubberies and lawns, with the lawn mowings and sweepings of the summer, it gets every year a heavier dressing of decayed vegetable matters than it does of farmyard manure. Whether it is the presence of too large a proportion of decayed vegetable matter or not I am not in a position to say. I limed it for Potatoes last season, and have thought of gas-liming this, but I am anxious to know whether this is the proper corrective or not, and it is just this which I am hoping Professor Oliver's report will teach me and all those who are like circumstanced. To frustrate the birds I have rather made up my mind to grow nothing but dwarf kinds of Peas, not to rod them, and throw a net over them when coming into use.—N. H. POWNALL, *Lenton Hall Gardens, Nottingham.*

CANKER IN FRUIT TREES.

I NOTE my friend Mr. Hiam keeps "pegging away" as regards the fruit tree canker being caused by an insect. Why need he trouble more about it? He believes it is; I believe it is. If others will not, it is of no use going on, nor should I write now, but a curious incident has occurred in the garden of a friend of mine which I wish to make known. He has a number of fruit trees of various sizes and ages. None has ever had or now has any canker. Lately he bought several young trees to plant about those already in the garden. This is the second year of the new trees, and every one of them is cankered. This being so, why were the others free? If it comes from the roots the old trees should have been well cankered; if from frost, why do they escape and the new importation of the same sorts not? Why, indeed? But the fact remains, and my friend intends pulling all the new ones up. My theory is they were impregnated with the insect pest when they came, though they looked healthy; hence the canker. Of course I cannot mention the nursery whence they came, but he assures me that apparently there was nothing the matter when he planted them. Let those who say it is the root, those who say it is the frost, and those who say it is caused by an insect, think the matter over, and I trust settle it right out.

For my part, my own experiments have so sufficiently proved to my satisfaction that it is an insect, that I trouble no more about it. If others think differently, well and good. If they believe their theory, I believe mine, thoroughly. I took several trees, some of which were cankered in the branches and in the stem. Each alternate one I had cleaned thoroughly, and twice a year covered with Gishurst compound. The canker healed over, and no more came. Several of the other trees not so treated became mere wrecks. I have no more to say on the

subject, and only trespass now, as I consider the above throws new light.—HARRISON WEIR, *Iddesleigh, Sevenoaks.*

MR. J. HIAM is about the best example of a tired man I have met with, for the more tired he gets the better he works. He compliments me on my superiority as a writer. I hope he will not do that, for if he had a good case I should evidently have to take a back seat as a controversialist. So long as he confined himself to the statement that insects caused canker in his own trees I did not deny the possibility, but when he alleges that insects were the originators of the evil at Impney and Packwood Grange I suspect it will tax his ingenuity to the utmost to prove his allegation.

He informs us he has seen the insects on the trees in those gardens. No doubt. So did I, and brought some of them to London. I suspect there never was any canker without insects. The case is similar to flies in a sugar basin, but though there visibly enough I do not suppose many persons would charge them with being the cause of the sugar.

No, Mr. Hiam, though I respect your belief, admire your earnestness, sympathise with you on your sore feet, regret your "soaking" in searching for truth, and almost lament your loss of 6s. and 1s. 9d. railway fare, I cannot agree that the insects you "discovered" on the trees referred to caused the canker amidst which they revelled till you prove that flies cause sugar.

Mr. Hiam asks in all seriousness whence the canker accompanying insects come from. He ought to be the best authority on that. I cannot even tell him exactly where the flies "come from," and they are much better to see than his microscopic friends. They are in the basin when the sugar is there, and depart when it vanishes. Mr. Hiam's insects come, he tells us, where there is no canker, cause this to appear, then travel on to fresh points of attack, and so on from branch to branch and tree to tree, eating till they cause great gaping wounds and gnarled swellings. But they miss some trees entirely—not, Mr. Hiam now says, because they have any dislike to them, for he had to "give up" that theory. What can be the reason, then, that they seize on a Ribston Pippin Apple, for instance, and turn up their little noses at a Golden Noble, passing it in contempt? Mr. Hiam had a good reply once—their preference for certain varieties; but now he has none, or at least none has appeared. Do they not visit one tree because its tissue is ruptured and feed on what they find there, leaving the other alone because there is no ruptured tissue, nothing on which they can subsist, no sugar in the basin? That is what sensible insects would do, and there seems a good deal of intelligence in what we call the lower forms of creation when they are searching for food.

Then we have the singular phenomenon in, we will say, Mr. Tonks' garden of, according to Mr. Hiam's theory, insects puncturing the trees and eating holes in the branches, and the more numerous the insects are and the more they eat the greater of necessity become the rugged chasms. That all seems logical enough, but here comes the flaw. Mr. Hiam says the insects are there yet, eating away as usual, yet the longer they graze the smaller the wounds become. We thus arrive at the extraordinary result that the insects eat for a few years and enlarge the wounds, then go on eating them and reduce them to the healing point, for Mr. Hiam cannot deny that for one wound that is growing in Mr. Tonks' garden a thousand are healing, and healing rapidly.

This healing was contemporaneous with soil improvement and the introduction of food elements that were previously lacking, and without which the trees were deficient in minerals that are requisite to their well being, and for fortifying them against rupture-destroying agencies, the chief of which is frost. Well fed—that is, "ripened"—wood escapes, where ill fed or unripened parts succumb, and trees that are naturally hardy in constitution escape injury, while those relatively tender do not, just the same as Mr. Hiam gets a "soaking," but I hope by his inherent vigour only feels temporary inconvenience, while a weaker man might suffer for months.

When it is suggested that Mr. Tonks "will not let it enter his head" that insects caused the canker in his trees (which he cured with the insects on them), I am bound to suspect that legitimate arguments are getting scarce, and am inclined to think that Mr. Hiam's reveals the weakness of his case in that observation more than anything can do that I have said. The insects will remain if allowed so long as new cortical layers extend and push off the old and decayed, for in that matter they find sustenance.

The presence of insects being admitted, any interchange of cankered parts would be obviously useless. It would be more generally useful to know precisely what to apply to trees to destroy or prevent insects, and thus, according to Mr. Hiam's theory, banish canker from gardens and orchards without interfering with—taking anything from or adding anything to—the soil. As I have not much of a name, I will content myself with the usual initial.—W.

P.S.—I have to close somewhat abruptly to catch the train for Impney at a cost of, I fear, much more than 6s. railway fare.

MR. HIAM informs us he was footsore and weary when he visited me. Even if I had known this, my plain duty was to give him every facility to attain the object of his visit. Therefore disregarding my own comfort, for it was gently raining, I suggested the inspection of my trees, to which he assented. I led him at once to some of the worst cases; trees which three years ago had been marked for destruction. The old wounds were full of crevices, in which various insects delight to hide, some of them doubtless to feed on the decaying bark, &c. He

took no notice of the innumerable instances where the edges of the bark were completely healed; but, after some search, he found two or three cases where struggling growth, having contended during three seasons with the combined action of canker wounds, drought, cold, wet summer, and two attacks of caterpillars, had this season finally succumbed. He took samples of these, and after examination with a pocket lens submitted them to the microscope; then, amongst other insects, pointed out one which he said was the cause of canker. It appears, now, that Mr. Hiam believes this to be "a species of the family of the red spider." Now, the red spider belongs to the order acarina, of the class arachnida. The specimen he showed to me is from its configuration a true insect, and as the arachnida are not insects, it clearly cannot belong to the family of the red spider. If Mr. Hiam can make a mistake of such importance, why is his dictum to be accepted, supported as it is only by his assertion, and the presence, possibly accidental, of the insect in the crevices of canker wounds? I again venture to advise him to search for these insects in the crevices of wounds not caused by canker, and also to send some other specimens of them to the *Journal of Horticulture* for identification. He states that "W." led him to believe that these insects had all disappeared from my garden. I cannot find in the pages of the *Journal* that "W." has ever made a statement which ought to lead anyone to suppose anything of the kind. Neither he nor I knew what kind of insect was referred to; neither of us has ever disputed its presence.

Mr. Hiam betrays a want of knowledge as to another species of insect. I directed his attention to a *Plumbago capensis* affected by a peculiar disease, a marked symptom of which is decay of the roots. This has for many years seriously injured my plants, and as yet I have found no remedy. He examined some of the leaves, and found, as was probable on a diseased plant, they were infested with insects "of a new description" to him. It will scarcely be credited that these insects were the common thrips, unfortunately too well known to every gardener. When he assigned them as the cause of the disease, I trust my reply was not so rude as "pooh pooh;" it is the less likely, as the expression very rarely if ever is used by me, though it must be admitted that the reduplicated word may be a concise paraphrase of what was said. Mr. Hiam has taken up the subject of his hobby with a very praiseworthy object, and the same hobby might be ridden by others with possible advantage to fruit growers in general; but more evidence is required before he can be admitted to be in a position to feel confident that he has "mastered the principle by observation and experiments," notwithstanding it has cost him a considerable amount, of some details of which he favours us with particulars.—EDMUND TONKS.

ORCHID NOTES.

WOODLICE.

If left for only a short time these pests increase rapidly and soon do a great amount of damage both to the roots and young tender flower spikes. Where Orchid houses are infested with these pests every effort should be made to destroy them. Fortunately they do not give much trouble in the *Odontoglossum* house; it is too moist for them. In the *Cattleya* and East Indian house, however, they will increase astonishingly and are capable, during the period the plants are resting, of devouring nearly every good root the plants have made during the growing season. We have tried many methods of destroying these pests, but none is effectual that is not continuous. A considerable time must elapse before they can be exterminated when once they have been allowed to become numerous. The most effectual method we have tried is to cut Potatoes in half, scoop out the centres, and then place them on the surface of the soil and about the house. A few Potatoes cut up are useless where the insects are plentiful; a large number should be placed about, and it is surprising what a quantity of woodlice can be destroyed in a week. Do not crush them inside the traps, for we have found that others will not go under them freely afterwards. The best plan is to drop them into a pan or dish, where they can be instantly destroyed. This method takes much time, but it is certain to reduce their numbers, and if persisted in will result in clearing the house and the plants. It is necessary to look over the Potatoes at night and again in the morning. If done only once during the day the pests feed and then retire to their hiding places. It is important to supply fresh Potatoes when the others become hard and dry. With this plan we also place empty 6-inch pots filled with dry hay about the house containing portions of Potatoes. These form capital traps for woodlice, although we have never succeeded in catching so many by this means as by the use of half Potatoes that have been hollowed out.

ANTS.

Perhaps these are a greater nuisance to the Orchid grower than woodlice; not that they devour the roots on flower spikes to any serious extent as far as we have been able to observe, but they attack the buds and often destroy the flowers. The greatest harm they do, however, is in working the moss and peat into small particles, thus rendering the drainage defective, the soil, if abundance of water is needed, becoming sour and unsuitable for the plants. This is not all, for they persist in carrying the soil into the axils of the leaves and other portions of the plant. We have soaked plants for twenty-four hours in a tub of water, but only to clear them out temporarily, or some of them for a time. The method we find most effectual in trapping them and eventually destroying them is to place some sweet syrup into moderate sized bottles. Bottles half full of treacle or containing a little honey attract large numbers. Small pieces of wire are placed round the neck of the bottles so as to secure them close to the sides of the pots infested. The same mixture is placed fresh on small plants daily, the insects being plunged into boiling water. Very frequently the bottles become nearly full before we find it necessary to empty them. Once the insects are attracted to these simple traps they invariably find their way in large numbers in a very short time. Hollow bones are also attractive to these troublesome little pests. Time and patience only are necessary to clear them out.

COCKROACHES.

Whatever harm woodlice and ants are capable of doing cockroaches do more in much less time. A few of these will clear off every flower spike in one night, and devour the young growing roots of many plants, in addition to attacking the young growths and tender foliage of any plant they take a fancy to. Without question they are the most destructive pests that the Orchid grower has to contend against, and do more harm in less time than all others combined. Where they exist in gardens they must be looked for frequently and destroyed by all possible means. Whatever trap may be set for them will not prove successful long, and therefore it is necessary to change the method of trapping them at intervals of a few days. Birkenhead's trap is a good one, but they will not enter it long. A little beer sweetened with sugar and placed in glazed jars sunk to the rim in the gravel or ashes on which the plants stand will prove very effectual at first. Small pieces of bread placed in similar jars will also attract them. Phosphor paste will poison them, and may be laid on pieces of cardboard, brown paper, slate, or any material, or spread thickly on thin pieces of bread. For a time they will eat this freely, but quickly refuse to be tempted after it has been placed down a few nights in succession. It is a good plan to watch for them with a light at night, when they can readily be captured.—ORCHID GROWER.

LEAVES IN ORCHID HOUSES.

IN the Orchid houses under my charge we have the floors formed into pits for holding leaves, which we find very useful for this purpose. Decaying leaves appear to be just the food for Cattleyas, and far better than stone, and which the floors of Orchid houses are generally formed of. When leaves are used there is always a genial humidity in the atmosphere.—A. Y.

LÆLIA BOOTHIANA.

Of this species, which is also known as *Cattleya lobata*, *Lælia virens*, and *L. grandis purpurea*, there are not many varieties; one, however, whilst being a vigorous-growing plant does not yield an abundance of flowers, but there is little or no difference in the quality of the blooms. Pseudo-bulbs clavate, slender at the base, but thickening upwards rapidly, furrowed and deep green; leaves solitary, oblong, obtuse, same colour as the pseudo-bulbs; scape terminal, erect, three to five flowered; sepals lanceolate, acuminate, with plain margins, rosy-purple tinged with violet; petals much broader than the sepals, oblong lanceolate, deeply and irregularly lobed, same colour as the sepals; lip three-lobed, side lobes incurved, covering the column deeply lobed, middle lobe spreading, also deeply lobed on the margin, colour rosy-purple, tinged with violet, and conspicuously marked in front with purplish crimson lines. It blooms in May and June, and is a native of Brazil, whence it was introduced in 1847.—G. T.

• DWARF BEANS.

THESE do remarkably well on ridges. I used to grow them in the ordinary way, but the contemplation of results from the level never filled me with that mingled sense of delight and importance which some call satisfaction, others conceit. However, a few years ago scarcity of space at planting time compelled me to adopt a different method—viz., planting between the Celery trenches, the making of which was delayed until the first week in May, then the distances being marked out a line was drawn midway between the

intended trenches, and the Beans sown on the bare surface, taking out and disposing of the soil as usual covered them sufficiently. I was rather diffident of success, especially as ours is a very light soil on gravel, but whatever the reason—would it be additional warmth at the roots?—dwarf Beans that year were a source of pride, profit, and pleasure. Economy of ground and labour, a prolonged crop, and better pods are obvious points, and the Beans are cleared off before much soil is required for earthing the Celery.—S. Y.

CENTAUREA MACROCEPHALA.

SOME of the *Centaureas* are common occupants of gardens, such as the silvery foliaged *C. ragusina* and the numerous varieties of the Cornflower, *C. cyanus*, but there are others that are seldom seen though we'll

FIG. 28.—CENTAUREA MACROCEPHALA.

worthy of a place in any border. The plant, of which a flower head is represented in fig. 28, is a bold and effective *Centaurea* in suitable positions. It is sometimes designated a coarse plant, but that is not worth much consideration, for it applies equally to scores of other excellent plants. It attains the height of 5 feet in good soil, and bears large globular golden flower heads, that look well rising above other plants in the foreground. There are no special difficulties in its culture, as almost any soil suits it, but it is a strong rooting plant, and in consequence thrives in a deep well dug border. It is increased by division or seeds.—M.

[The woodcut was prepared from a specimen grown in Mr. T. S. Ware's nursery, Tottenham.]

SHADING AND SYRINGING MELONS.

IT is the practice of some gardeners to shade Melons during the hottest part of the day, and not only do I think this quite unnecessary

but even syringing as it is commonly practised is an evil. We never shade, however hot the day, or syringe beyond a slight dewing over at closing time on a hot day for about a fortnight after planting. We never have a scalded leaf or even red spider or thrips, and the foliage keeps quite a dark healthy green up to the time the fruit is cut. The Melon houses are never above 70° at night, with a little ventilation continually. We also ventilate more freely during the day than most gardeners, even opening the front lights to a considerable extent. This treatment causes a strong and sturdy growth from the first, able to withstand the hottest sun, and keep insects away. The soil cannot be made too firm at planting time, however heavy its nature, and animal manure should be avoided. We use heavy calcareous loam, with a sprinkling of fine bone flour and charcoal. Loose soil causes a sappy growth, and when the house is kept over-hot and close the growth is weak, and collapses with bright sun. To have good flavoured Melons healthy foliage is necessary, so means must be taken to meet this end. Over-syringing is probably the cause of scalded leaves. To those who are in the habit of syringing at night and morning the above remarks may appear strange, but they are nevertheless true. The Melon houses here are very light lean-to's, well exposed to the south sun, being on an incline; so during hot days they are very hot indeed. Melons appear to revel in sun.—A. YOUNG, *Abberley*.

BULBS IN GRASS.

PLANTING bulbs annually in the grass and under trees on lawns has its disadvantages, requiring much more time than many can afford; neither are the results so satisfactory as in the case of planting the bulbs where they can remain some time. In this manner the quantity of bloom obtainable is far in advance of that procured from those which are disturbed twice a year. Bulbs in the grass, where the varieties are numerous, give an excellent lasting effect, and it is a form of garden decoration at a dull time of the year outside, which is much to be recommended. Everybody cannot devote a piece of grass to this purpose, but where such a plan is practicable the results are greatly appreciated. The one point of most importance in successful bulb culture is allowing the bulbs to grow thoroughly after flowering, the foliage to develop to its fullest extent and ripen before the grass is cut. Such a bulb garden, as I will call it, affords an excellent site for the disposal of the bulbs of various kinds which have been forced and flowered inside the conservatory or dwelling house. It often happens that a difficulty arises after the bulbs have flowered as to what to do with them. Some find their way to the rubbish heap as worthless for future development after being once forced into flower. Such a garden as that suggested is just the place for these forced Dutch bulbs, as they will flower every year after being properly planted, and will afford much pleasure. In this manner a succession of flowers can be obtained lasting for a long time, several months in fact, if a selection be employed which has the necessary range of flowering.

Commencing with Snowdrops, we have *Galanthus nivalis*, double and single, and *G. Elwesii*, a giant among Snowdrops, with bold glaucous grey leaves and handsome flowers. These begin to flower about the middle of February, and are succeeded by Crocuses of various colours during March and the early part of April, according to the position and state of the weather. We have had some thousands planted of the large yellow, white, and purple selfs in a disused orchard, about 2 acres in extent. The trees were removed about ten years since as being useless. The piece of ground is long and narrow, and bordered nearly all around by tall deciduous trees, such as Oaks, Elms, Limes, and Chestnuts, somewhat protected in consequence from the worst winds, which would tend to spoil the appearance of the flowers when expanded. On this grass we have planted several Conifers, Rhododendrons, and deciduous flowering shrubs, that add to the attractions in their proper season of flowering, which is extended into the autumn by the use of *Tritomas*, *Bocconia cordata*, and *Pampas Grass*. In no form whatever does the Flame Flower (*Tritomas*) show to such good effect, the colour of the grass lending a capital contrast to the brightly coloured flower heads, and the season is prolonged by planting *T. glaucescens* and *T. Uvaria*, the former flowering fully a month earlier than the latter. The method we adopt in planting the Crocus, Snowdrops, and Tulips is as follows. In October we make holes in the grass with an iron bar rather blunt at the end; at the bottom of the hole we drop a handful of fine sandy soil; the bulb rests on this soil, which assists the formation of roots more quickly than would be the case in the ordinary soil, which is retentive, and in some places of a stony character. The hole is then filled with the soil, the bulbs being about 3 inches deep when planted. Aconites we have tried, but they have not been a success by reason of the thick covering of moss which grows in that part of the ground where these were planted, through this reason the plants are simply spoiled. It not being practicable to remove the moss we shall have to be content to let the Aconites

struggle on in their position. The Crocuses, I ought to say, are planted in patches of distinct colours, in some places about 6 feet square. This arrangement is preferred to mixing them indiscriminately, although some are so planted. It is surprising how quickly the single bulbs of Crocuses increase; the second year as many as eight blooms are produced from one bulb planted the year before. When the sun is shining brightly the blooms of Crocuses expand; in this manner the effect is very pleasing, and should be seen to be appreciated. Amongst the Crocuses are planted many roots of coloured Primroses, which begin to flower before the former fade, and are very pretty in the grass. In the grass there are numbers of Lenten Lilies in patches some 10 feet square. Double Daffodils are planted in clumps, some thousands there are now, patches of this bulb having been there for over twenty years. The effect of the orange yellow masses when fully in flower can easily be imagined. These are succeeded by a pale yellow Narcissus, which now occupies spaces 4 feet across.

For some years we have made a practice of planting the forced bulbs from pots after flowering in the grass amongst the other bulbs. Turning them out of the pots without removing the soil, they are planted, first removing the turf and some soil, then making a hole large enough to admit the ball of soil and roots intact. The soil being good assists the growth of the bulbs for some years. The grass is then rolled back, only allowing space for the stem and leaves. The forced bulbs which are planted in this manner are Hyacinths. Double and single Tulips, Jonquils, and Polyanthus Narcissus, all flower freely every year. To give a greater variety we last season planted Parrot Tulips, and there is a goodly number of the tall old-fashioned striped garden Tulip, which flowers the last of the bulbous plants, and having tall flower stems they are just right for that time of year when the grass is growing above the height of the ordinary bedding Tulips. The grass is allowed to grow until the early part of July, by that time the bulbs will be ripe and the foliage ready for removal. A crop of hay is then had from the grass, which is kept short for the remainder of the year. Some time in November the grass is mown short, the leaves are raked off, so that no trampling is necessary among the bulbs at the time when new growth may be expected early in the year. On the grass are planted Rhododendrons of various colours, red predominating. These and some Conifers give variety during the winter, and the former give highly coloured flowers in May and June.—E. MOLYNEUX.

NOTES ON EARLY ENGLISH HORTICULTURE.

(Continued from page 48.)

FRENCH horticulture made remarkable progress after the middle of the seventeenth century; this was due partly to the encouragement it received from Louis XIV., and partly to the labours of the famous Jean de Quintinye. When a youth he travelled in Italy and other countries, returning to France with a mind stored with the results of observation, and the remainder of his life was devoted to horticulture and botany. Amongst the other improvements he introduced was an excellent system of pruning fruit trees, for previously the methods used seem to have been somewhat barbarous; he also advocated the placing of Vines and various trees upon walls, a practice till then scarcely known. He pointed out the necessity of protecting at night during certain seasons plants that had been exposed to the sunshine by day, and many valuable hints are offered to the gardeners of his time in his works, one of which, "The Complete Gardener," was translated by our Evelyn, and again by London and Wise. It was a natural consequence of the Restoration, when Charles II. and his courtiers quitted the land which had given shelter to many English refugees, that they should bring home a taste for French fashions generally, and for French modes of gardening in particular. Hence the influence of the sister land is very traceable, and probably in the whole beneficial during this reign and the next, till the arrival of "Dutch William" brought about a change, and the Netherlands, from which England had learned so much in the Tudor times, became again our instructors in new arts of gardening.

The closing Stuart period of our history was not, indeed, distinguished by its peacefulness, but the cessation of civil war gave encouragement both to agriculture and gardening, pursuits which cannot flourish when domestic turmoils make it doubtful whether he who sows or plants will see the result of his labours. Not a few of the little hills north of London were thickly studded before the Civil War with the gardens of merchants and citizens, and near the Thames (for convenience of transit) were some other gardens in which the pioneers of modern market gardening raised vegetables for the market; but these all suffered from extemporised fortifications and the marching of troops. Hence it really was not till after the Restoration that the trade of florist, or that of market

gardener, occupied a distinctive place as callings; there was, indeed, of older date a guild of gardeners. The members of it, however, were mostly gardeners to some nobleman or citizen, or else were amateurs. The law, too, of supply and demand made men reluctant to raise articles of a perishable nature the sale of which was doubtful, until the growing prosperity of the nation led many to seek articles previously regarded as luxuries.

John Rea, who writes himself a gentleman (as every gardener is, or might be, and I was pleased to read some statistics lately showing how rarely gardeners are guilty of any crime), appears to have been one of the first professional gardeners. He published about 1665 a folio book, now scarce, explanatory of the art of planning ornamental gardens and pleasure grounds. But the great man of this period was John Evelyn, of whom Switzer wrote, with all a young man's enthusiasm for one who was old in the craft, that after the calamities of England were over "he reanimated the spirit of his countrymen for the planting of woods, and made gardening speak proper English." As a young man of twenty-four he travelled on the Continent while Charles I. was king, and in his journal he notes that he made careful examination of twenty-six gardens in France and Italy. From his observations there and elsewhere he was led to form theories which on his return to England he put into practice, and tried to persuade his countrymen to do likewise. While Cromwell was Protector Evelyn wrote his "Gardener's Calender," an able work, though only a fragment of an encyclopædia which he had planned but did not complete. But his grand performance was the famous "Sylva," of interest to the gardener as well as to the forester. This was published in 1664, and about 1000 copies sold in two years—a remarkable event. Evelyn was also able to state that, within a few years after its appearance many millions of trees were sown or planted as a result, and, as a minor consequence, more and better cider was made; this subject being treated in "Sylva." Another book of his, which was somewhat significant, was his "Fumifugium," designed to show that the "inconvenience of the air and the smoke of London" might be removed. How gladly should we greet a modern Evelyn who would tell us a plan to deliver London from its murky fogs! The scheme proposed in the reign of Charles II. was not a bad one for the time—viz., the removal of all factories or furnaces six miles out of London, and also the planting of groves and shrubberies in vacant spots. We are, however, working on his line in the movement by which hundreds of open spaces about the metropolis have been made bright with flowers and greenery during the last seven years.

The estate attached to Sayes Court at Deptford, of 260 acres, gave Evelyn the opportunity of planting largely, and there, remarks Lord Guildford, he illustrated his book on trees, for he spared no pains to obtain every species attainable, both useful and ornamental. English hedges, till then, had chiefly been made of Hawthorn; but the conduct of Czar Peter, to whom for a time Evelyn unwisely let his mansion, showed Evelyn that it would be an advantage to enclose gardens with hedges, through which barrows could not be wheeled, and he advised the use of Holly or Yew. One of his Holly hedges was long famous on account of its length, breadth, and from a mention of Phillyreas, in a MS. regarding damages done to plants at Sayes Court by the careless Czar, it may be concluded this species was one of Evelyn's favourites. The arrangement of fruit trees upon walls, built circle within circle, was a new fashion followed by Evelyn and others, supposed to be advantageous then, now out of date; but specimens of these walls remain. Pepys, in his Diary, notes down in July, 1666, that he considered flowers were better grown in plots than in borders, because the latter are likely to be trod over by strollers along garden walks. He also notes what he had perhaps heard from Evelyn, that English garden walks were at that time unrivalled, even by France or Italy.

Under date of June 10th, 1658, Evelyn records a visit to a garden in Westminster containing exotic plants, collected by one Morgan, a botanist. This is supposed to have been the establishment referred to in the early annals of the Apothecaries Company, as having given the start to their Physic Garden at Chelsea, which was the means subsequently of bringing to England a very large number of rare plants. Some of the best private gardens of this reign were on the north or east of London; thus, on the way to Hampstead there was Belsize House, with groves and gardens, and a house containing fine Orange and Lemon trees, the seat of Lord Wootton. At Hackney a much-admired garden was owned by Lord Brooke, and Sir O. Cook had a garden there containing two greenhouses when Pepys went to the place, and he saw that the roof of one of these having been made a receptacle for water it gave way, being overweighted, destroying many of the plants. This little anecdote is interesting, as proving that the greenhouses of that time had neither glazed nor sloped roofs usually. Gourle was a well-known gardener at Hoxton, who was probably a raiser of varieties, for he produced a Nectarine, to which he gave the

name of Elrouge, by transposing the letters of his own name. Then Loader, a maker of anchors, had in Greenwich an extensive garden, with terraces and an orangery. Inigo Jones, who had already distinguished himself in other ways, is said to have occupied his time during part of the reign of Charles II. in planning or executing decorative garden buildings. This monarch made overtures to several French gardeners of distinction, and one of these—Le Nôtre, who had laid out Versailles and other celebrated gardens—came over to England. Under his direction Greenwich and St. James's Parks were planted, and it is supposed that he may have helped to plan the gardens at Chatsworth and Ham House, possibly suggesting changes at Hampton Court, which were somewhat altered about this time. One of the peculiarities of the period was the occasional planting of lines of Reeds, placed in a narrow streamlet, to protect choice plants from high winds.—J. R. S. C.

GLOXINIAS.

THE idea prevails with many that a strong heat is necessary for Gloxinias, and that their sole acceptable home is the stove. That may be so where large leaves are the object, but where the convenience exists, and those in charge are not ambitious to excel in size of foliage, a fine display of flowers may be had in a late vinery during July, August, and September, provided the growths overhead are so thinly trained as to admit plenty of light. In many instances the roots are brought on successively, and this is a useful practice as regards cutting; but for decoration a plant here and there a yard apart is entirely lost; they must be seen in a mass to be fully appreciated. The flowers being choice and exceptionally showy, a stage containing 100 or more plants in flower, relieved by several small elegant Palms, is a feast of colour not soon forgotten.

Started in boxes in April they adapt themselves to circumstances quite comfortably, taking up little room, while the houses are filled with bedding plants, and when relief comes they are ready for potting and the space left vacant. Houses that would otherwise be empty or dull can thus be rendered brilliant and pleasing. It is useless, however, attempting to grow Gloxinias well, or, in fact, anything else, under Vines that are cultivated (?) on the go-as-you-please principle.—S. Y.

THE FIRST SHOW OF THE SEASON.

CHRYSANTHEMUM growers are already beginning to look with greater interest at their plants in preparation for the November exhibitions, and in the meantime the National Society's Exhibition of early varieties, which takes place at the Westminster Aquarium on Wednesday and Thursday, September 11th and 12th, may be considered as the commencement of the Show season. Useful as the early Chrysanthemums undoubtedly are, it cannot be expected that they will ever attain the popularity of the November varieties for Show purposes. Still they are well worth encouragement, and the classes provided for them form an agreeable feature.

In the schedule issued by the Society named nine classes are devoted to the early Chrysanthemums, the prizes ranging from £5 to 5s. They are as follows:—Group of Chrysanthemums, any varieties, arranged in a space not exceeding 60 square feet, quality and general effect to be the leading features; collection cut Chrysanthemums (any varieties and in bunches), quality and number of varieties to be the leading features; twelve blooms, Madame C. Desgrange; twelve blooms, any varieties except Madame C. Desgrange; twelve Pompons, three flowers of each, to be shown in bunches with foliage; six bunches Madame C. Desgrange, three blooms in each, with foliage; six bunches any of the yellow varieties of Madame C. Desgrange, three blooms in each, with foliage; six bunches any varieties except Madame C. Desgrange, three blooms in each, with foliage. Amateur class, for those who do not employ paid assistance of any kind in the culture of Chrysanthemums.—Twelve bunches Chrysanthemums (Pompons allowed), three blooms in each, with foliage. In addition to these sixteen classes are devoted to Dahlias in the different sections, and there is one for a collection of Gladioli spikes.

A Conference of cultivators and others interested in the Chrysanthemum will be held on September 11th in conjunction with the Exhibition above named, and the programme prepared by the Sub-Committee appointed to carry out the arrangements includes a paper by Mr. W. Piercy of Forest Hill on "Early Flowering Chrysanthemums,"

and a paper by Mr. J. Doughty of Angley Park on the "Treatment of Plants (Grown for the Production of Exhibition Blooms) a Short Time Previous to the Shows." The chair will be taken at 4 P.M. Mr. Piercy is a well known authority on the subject about which he intends to discourse, and something of interest and utility may be expected. Mr. Doughty is the "Champion of Kent," and is sure to contribute some remarks of practical value.

The Hon. Secretary, Mr. Holmes, will no doubt be in town for the opening of the National's session, and I hear he is on his way from the Green Isle, where he has been exploring the Killarney region in search of beautiful scenery and health, both which it is to be hoped he found. He writes concerning Dublin:—"They have a superb lot of Chrysanthemums in the Dublin Botanic Gardens—I think the finest lot of plants I ever saw; and what a house of Todeas they have, and enough Killarney Fern to stock the world, certainly £1000 worth."—C.

IN THE MIDLANDS.

A GREAT deal of what is interesting may be seen during a few days' sojourn in the beautiful and fertile county of Worcester and over its boundary into Staffordshire. Obviously only a comparatively small number of the readers of this Journal who are identified with horticulture or agriculture can inspect what they would desire, and therefore must be content to "see with other eyes" something of what is presented to view in great trade establishments and good private gardens. Two of the former and three of the latter having afforded much pleasure to the writer during a three-days ramble and a Sunday's rest, he will endeavour to give an idea of what was brought within the field of vision in the quick "rush through" the places that will be briefly referred to. It was convenient to visit the most distant first and work homewards. Therefore in that order they will be of necessity very imperfectly described.

STOURBRIDGE, WORDSLEY, AND KINVER.

The mention of those names will sufficiently indicate that the great and successful trade undertakings of Messrs. Webb & Sons are to be brought under review. Stourbridge appears to be a thriving town of 10,000 or 12,000 inhabitants. If a stranger find his way to the Talbot Hotel, and asks if anything is known of a "firm of the name of Webb," he will, though receiving a very civil reply, be probably regarded as something of an ignoramus. To the officials and frequenters of this good hostelry the Messrs. Webb are decidedly men of rank. One will tell you they are magistrates, another that they are leading property holders, a third that they are great Hop, wool, and manure merchants, a fourth that they are the "biggest seedsmen in the world," as well as being largely interested in the manufacture of glass. The finest of glass is made and cut in Stourbridge. It has long been the chief seat of the industry, and the highest prizes at the Paris Exhibition for the manufacture of articles from "tumblers" to epergnes and candelabras, with everything else between, were awarded to produce from the town. So much, then, for Stourbridge and the family that is evidently held in much esteem there, and we pass on to Wordsley to see what it is like, and to Kinver to see what is being done there.

Wordsley is a small village two or three miles from Stourbridge, and the head-quarters of Messrs. Webb's gigantic business, for by no other adjective can it be accurately characterised. Apart from this business the village would rest in obscurity; with its name is familiar to the English-speaking race, or at least that important section of it which is identified with farming and gardening. The nation has reason to be proud of its great firms who have done so much in improving the varieties in cereal, roots, and other vegetable crops. In this commendable work Messrs. Webb & Sons share extensively, with great credit to themselves and satisfaction to thousands of home and colonial clients.

Having long enjoyed wide local fame amongst the agricultural community, Messrs. Webb a few years ago took steps to widen the scope of their operations as growers and purveyors of seeds, not for the farm alone, but for the garden. The innate business aptitude of the firm, their great resources, and the thoroughness of the action displayed is proverbial, with the result that they have achieved a commanding position in a very short time. The magnitude of their operations is abundantly evident at Wordsley. The great and substantial piles of buildings would not have been erected if not demanded. They are simple necessities of an expanding trade. It would be tedious to enumerate the different buildings and their dimensions. These, in fact, have been given on previous occasions, with one highly noteworthy exception—a recently completed warehouse, which was being photographed on the day of inspection. This structure is 120 by 50, and 75 feet high, with six floors. It is an addition to a previously large block, and the offices have also been enlarged. The different buildings appear to be replete with machinery and every other requisite, and in one of them the packing of bulbs of various kinds was going briskly on.

Kinver is four or five miles from Stourbridge, the drive being a particularly agreeable one on a bright clear day. The district is boldly undulated and richly wooded, the fine trees and full field crops testifying to the fertility of the soil. After passing through the village of Kinver the ascent becomes somewhat steep, the immediate approach to the farms being decidedly picturesque, the road passing through a gorge flanked by rugged rocks, and the overhanging trees afforded grateful shade on the hottest harvest day of the year. On reaching the comfortable farm residence the view over the farms to the bold Kinver edge on

one hand and horizon on the other is very delightful, the altitude rendering the air pure and bracing. This, with soil of excellent staple, and charged with fertility of the right kind for crops, imparts to flowers unusual brightness of colour, and to grain the density that growers and sowers like to see and to feel. There can be no question that these farms are admirably adapted to the purpose to which they are devoted. They embrace, with a recent addition, nearly 2000 acres, a great part being the freehold of the firm which cultivates them so well.

A considerable extent of ground is devoted to experimental crops and stock testing purposes. All the varieties of popular flowers and vegetables of repute are grown for comparison, and for displaying their character and testing their purity. It is the same with farm crops—pasture, forage, roots, and grain. It is the simple truth to say there appeared to be no blanks or failures; no mildew, insects, or grub-infested roots. A pleasing feature in connection with these comparative trials is the ready recognition of the merits of samples, come from whence they may. Messrs. Webb appear to be in the fullest sense fair competitors in the seed-raising world. They have a high aim, and seek for excellence in varieties perseveringly.

Very gay was the great garden of flowers, each kind in its separate square, massive Stocks and Asters, brilliant Zinnias, rich Marigolds, and so on through all the half-hardy section. The chief hardy annuals were similarly displayed, but some of these were naturally fading. One of these was the Sterling Poppy, though the remnant showed how gorgeous the mass must have been. This strain has been obtained by intercrossing the Danebrog, umbrosum, and other varieties with the large P. somniferum, and combines stateliness of growth with remarkable diversity in colours. Masses of Tropæolums and glowing glossy crimson Linums had a dazzling effect in the bright sunshine, and the eye sought relief in the softer yet charming Nemophilas and other flowers of cooler tints. The best repose, however, was provided by parallel beds of Grasses for lawns and farms, kept "down" to show their character in field or garden. The various kinds are grown separately, and their differences are apparent and can be perceived at a glance. These sample plots are both interesting and instructive.

Adjoining are the sample plots of vegetable crops, a few rows of the different varieties of the several kinds being grown for comparison—Carrots, Turnips, Onions, Beet, Cabbages, Kales, Savoy, Beans, Peas—everything, the whole forming a museum of useful vegetation. Neither time nor space permits an enumeration, much less a description of those grown, nor is it necessary to make the attempt, for the most noteworthy and generally satisfactory are with great accuracy described in the well-prepared catalogues of the firm. The crossing of vegetables is pursued systematically with the object of obtaining superior varieties.

Peas alone are a study at Kinver, new forms are almost bewildering, and it is no light task selecting and "fixing" the most worthy. Few persons are aware of the time that must be spent, and the discrimination exercised in establishing a new Pea that shall retain all the desired characters. A good cross can be effected between varieties in the hope of blending the best properties of both. Double crosses are obtained in each case. For instance, if Ne Plus Ultra is crossed with Wordsley Wonder, this is crossed with the former at the same time. The result of this may be that every pea in the two pods when sown will in some points display the union, yet some of the plants be tall, others dwarf, some may have more or less curved and pointed pods, others being straighter and square ended. One may be enormously productive yet defective in quality; another may be superior in quality, but not free enough in producing. The work of selection, then, when a number of crosses are effected, may be imagined. Not in one year, nor two, nor three, can the work be exhausted. But a few varieties can, perhaps, be fixed every year out of dozens that must be excluded, and others retained for further trial. It is useless in these days sending out varieties simply because they are "new." The selection must be most rigid, and some courage exercised in the casting out process. A combination of good qualities can alone satisfy the public and bring credit to and beget confidence in the raisers. Messrs. Webb are fully alive to this, and work to an ideal standard. When according to their judgment this is attained, and not till then, a stock is raised for distribution. This also involves time, experience having proved that this stock must be a large one, or inability to supply applicants ensues, thus leading to disappointment all round. Of some varieties the supply is already considerable, but when they will be distributed, and what they will be called, are questions for the firm to determine. Others still scarce will follow, for there are, without doubt, several distinct and meritorious varieties amongst the Wordsley creations which the public will have the opportunity of testing when the time comes.

Potatoes are also raised in great numbers by cross fertilisation, and the work of selecting and sorting, excluding and retaining, is an important part of established routine. Success in the past encourages the firm to persevere in this work. They find it necessary to reject sternly, select carefully, try well, then to grow largely of those which possess the desired qualities. They consider Stourbridge Glory one of their great "hits," over which they made a great mistake in placing it in commerce too soon, with the unpleasant result of not being able to meet the demand. Though raised from Woodstock Kidney the plants are more vigorous than Magnum Bonum, and withstand weather vicissitudes better than most others, the leaves remaining green while those surrounding were more or less blackened by the cold and wet a few weeks ago. When tried the crop was exceptionally heavy, and large growers of Potatoes for market have found out the usefulness of the variety in question. There was no time to examine the different stocks that were

being grown for seed purposes. Some of the variety Renown were, however, taken from the ground, as this is the favourite Potato of the senior partner of the firm. Evidently he is no bad judge. It is not possible to imagine tubers rounder, and they are also of large uniform size, with rough skins, and the eyes set in the faintest possible depressions, so that there can be scarcely any waste in paring. It is a second early, said to be ready for use as soon as the leaves wither, and to retain its excellent cooking quality throughout the winter.

So far we are only on the fringe of the operations at Kinver. There is the great beyond devoted to trials of farm roots and grain crops, trials of manures on different crops, small plots on which cross-fertilisation is conducted with cereals and various root-producing plants, and hundreds of broad acres in which stock seed is grown of special varieties for raising seed elsewhere to meet the yearly demand. The grain harvest was being gathered in under the most favourable circumstances, and was, in fact, nearly completed. In a new Dutch barn Webb's Chevalier Barley was being rapidly stored with the aid of an elevator, the estimate of the yield in this one building being 4000 bushels. This is the variety which they point out with pardonable pride won the champion cup on two consecutive years at the Brewers' Exhibition. That is sufficient evidence of quality. The special stocks of other kinds of grain were also being secured in the best and brightest of condition, and the crops were splendid. As to the varieties, any person desiring to do so can find all particulars about them, and everything else in the way of grain, cereal, and root crops in the different catalogues of the firm; and a perusal of these works, one of which appears to be devoted to each section of the business, will show conclusively the utter impracticability, not to say impossibility, of doing more in an article than give a general idea of the operations at Kinver.

The full crops may probably to a great extent be accounted for by the judicious use of chemical manures, of which Messrs. Webb are great manufacturers, and they are not the people to offer to others what they do not find good for themselves. There were Mangolds not far short of a yard round in August, and field Cabbages nearly a yard across. This is no exaggeration, and the specimens will no doubt be in evidence at their seed and root stands at forthcoming exhibitions. Kinver is an out-of-the-way place no doubt, but worth a long journey to see when the grain crops are ready for reaping, root crops covering the ground with luxuriant growth, vegetables thriving in interesting variety, and flowers imparting beauty to the scene.

EVENTS OF THE WEEK.—The present will be a somewhat busy week for metropolitan horticulturists, and both fruit, Dahlia, and Chrysanthemum growers will have a chance of showing their skill. To-day (Thursday) the Floral Committee of the Royal Horticultural Society will meet at Chiswick at 2 P.M. On Friday the Fruit and Dahlia Shows at the Crystal Palace, Sydenham, will be opened, and extensive displays are expected in both departments. These Shows also continue on the following day, Saturday. The National Chrysanthemum Society's early Show (noted on page 199) will be held at the Royal Aquarium, Westminster, on September 11th and 12th, the Floral Committee of that Society meeting on the first of the two days named at 12.30 P.M. The Brighton Show will be held on the same days.

GOLD MEDAL FRUIT ESSAY.—We are requested to announce that the prize of twenty-five guineas offered by the Fruiterers' Company for an essay on profitable fruit-growing for cottagers and others with small holdings, and the gold medal offered by Dr. Hogg to the winner in the competition, have been awarded to Mr. J. Wright of 36, Alma Road, Wandsworth. Advertisements of the competition appeared in the issues of this paper of April and May last. The following is the report of the adjudicators:—

"Having carefully examined the fourteen essays submitted, we have unanimously selected that signed 'British Workman' for the award of the prize. This essay combines practical knowledge with literary ability, and complies with the conditions of the competition. A considerable proportion of the fourteen essays deserve commendation, and it is a matter of regret to us that we have only one prize at our command, where perhaps three or four might be worthily awarded. We would mention those signed 'Pomona,' 'Progression,' 'Jabez Chawley,' and 'Hope On' as particularly meritorious, although not meeting with our entire approval in connection with the present reference.

"T. FRANCIS RIVERS,
"A. F. BARRON,
"SHIRLEY HIBBERD.

August 26th, 1889."

GARDENERS' ORPHAN FUND.—We are pleased to learn, through Mr. Wildsmith, that on the occasion of the public opening of the famed gardens and grounds of Heckfield Place on August 24th and 26th, by the kindness of Lady Emma Shaw-Lefevre, the sum of £6 10s. was realised for this excellent charity. Greater numbers of visitors would doubtless have been present, but the weather was very unfavourable on the first day.

SHREWSBURY SHOW.—In the report of this Show last week our representative inadvertently omitted to say that Messrs. Richard Smith & Co., nurserymen, Worcester, exhibited, not for competition, a miscellaneous group of stove and greenhouse plants, including choice Crotons, Dracenas, Palms, Ericas, and other variegated plants, together with about three dozen Lilies in variety full of flower, the whole of which were a great attraction and much admired. The same firm also exhibited a good collection of variegated and ornamental foliaged trees for giving effect in park planting, for which they were deservedly awarded a certificate of merit.

MR. F. T. SMITH, 19, Martell Road, West Dulwich, has submitted a collection of HOLLYHOCK BLOOMS to our inspection, gathered from about 3000 plants of 100 varieties. The blooms were of medium size, but good in shape and varied in colour, some very soft and brilliant shades being represented. He states that his plants are quite free from disease, and have not during the past seven years been affected by it in the slightest degree. Seedlings are relied upon for increasing the stock, the varieties being grown separately and the seed carefully collected, so that a large per-centage of the seedlings come true to their colours. It is quite refreshing to see Hollyhocks again in something approaching to show condition, and there is no doubt that the system of continuous propagation by cuttings has had much to do with weakening the constitution of the named varieties.

PRESERVING GOURDS.—Can any reader of the Journal inform me how Gourds are preserved without cutting them open? We want them preserved in the same way that the Japanese people treat them.—J. T., Walton.

GLADIOLI AT PARIS.—We are requested to state that Messrs. Kelway & Son, Langport, Somerset, have been awarded the premier prize at the last Flower Show (August 16th to 21st) of the Paris Exhibition, held in the Trocadero Palace Gardens, for a collection of about 150 spikes of Gladioli.

The same firm sends us a spike of GLADIOLUS LEONARD KELWAY, said to be derived from a cross between G. purpurco-auratus and G. gandavensis. The flowers are of good size and shape, and remarkable for their extremely deep crimson colour, having quite a distinct tinge of purple. The spike is of moderate size, but the colour will please many who are not exhibitors.

PRESTON AND FULWOOD HORTICULTURAL SOCIETY.—The twenty-third monthly reading (first of the present season) is in connection with the above Society will be given in the large room of the Castle Hotel, Market Place, Preston, on Saturday evening, September 7th, when Mr. W. P. Roberts of The Gardens, Cuerden Hall, will read his paper on "The Mignonette and its Culture." The chair will be taken by the President at 7.30 prompt.

GARDENING APPOINTMENTS.—Mr. Joseph Maddocks, late gardener to B. C. Roberts, Esq., J.P., Oakfield, Chester, has been appointed gardener to Lady Alice Ewing, Coed Derwen, Bettws-y-coed, North Wales. Mr. Thos. Dennes, for the last two and a half years foreman at Worksop Manor, Notts, has received the appointment as head gardener to Mrs. Cookson, Binfield Park, Bracknell, Berks.

COCKSCOMBS AND CELOSIAS AT ABBERLEY.—In the above gardens is a splendid display of these plants. The Cockscombs are large and of a vivid crimson colour. The Celosias are also a fine strain, being of the true pyramidal form. The plants range about 4 feet in height and 3 feet in diameter at the base. These plants are excellent for conservatory decoration, and the wonder is that they are not more largely grown.

THE RAINFALL AT CUCKFIELD, SUSSEX, for the past month was 3.42 inches, being 1.24 inch above the average of nine years. The heaviest fall was 0.63 on the 11th, rain falling on fifteen days. The highest (not strictly shade temperature) was 87° on the 30th and 31st, and the lowest 41° on the 25th. Mean day temperature, 74.3°; mean night temperature, 49.2°; mean temperature, 61.7°, being 2° below the average of seven years.—R. INGLIS.

— **YORK FLOWER SHOW AND GALA.**—The abstract of the Treasurer's account in connection with the York Flower Show and Gala, held last June, was presented at a meeting of the Committee held at the North-Eastern Hotel, York, on August 30th. The document showed that the Exhibition had resulted in gate receipts amounting to £1456, against £1215 in 1888, and that the total income for the year had been £1888. The expenditure had amounted to £1723, leaving a profit on the year of £164. On profit and loss account this balance was reduced to £64, and of this amount it was resolved that the following sums be given to local charities:—£40 to the York County Hospital, £10 to the York Dispensary, and £10 to the York Lunatic Asylum. A number of votes of thanks were also passed.

— **"A. C. W."** (page 175) depreciates the knowledge of gardeners and people in general with regard to **EDIBLE FUNGI**. He is loud in his praise of the Mushroom, which the people north of the Tweed are not able to distinguish from a puddock-stool. But of all these fifty funguses, which are so ignorantly passed by the Mushroom gatherer, he has not a word of praise for a single one of them. There are doubtless plenty of edible fungi besides the common Mushroom, but that they exist so plentifully as your correspondent would lead us to believe few, I think, will agree to. His suggestion about coloured plates I would take to be more imaginary than practical. At any rate, I for one would not like to stake the results of eating an unknown fungus merely from such a description. I am afraid your correspondent after all belongs to the majority.—D. G. B.

— **PELARGONIUM E. F. CROCKER.**—Those who are partial to the more refined tints in bedding-out arrangements should make a note of the above variety for such purposes where a bright and attractive but not gaudy piece of colouring is required. A sport from Master Christine, it contains all the good qualities of that popular variety with a decided advance in point of habit, and increased size and substance of its petals; but the chief and most pleasing charm of this fine variety lies in the additional depth and brightness of the colouring of its flowers. These, borne on stout footstalks in medium-sized trusses with the same freedom as is common in the older type of Christine, present a concentrated tone of colour of at least treble that of its parent, with a pleasing dash of red in its composition which lends a peculiar bright and rich character to the original lovely hue, that is the predominating feature of the Christine type.—M. C.

— I AM disposed to think the **APPLE CROP** is not the general failure at first anticipated. Recently I have been through several country districts, and was agreeably surprised to see so many Apples on trees in farm and cottagers' gardens. I also noticed numerous trees in a few orchards that seem to be very well stocked with fruit. In some instances the varieties are of little value other than for cider making, but there will yet be a considerable weight of fruit suitable for the markets. It is a curious fact that the best crops are on trees growing in low positions, or where they more often fail than not. I also found on making inquiries that most of the trees bearing good crops this season carried few or no fruit last year. They did not flower nearly so abundantly as many that failed to set any fruit, and in all probability the flowers were stronger and more perfect accordingly. Apples generally are growing out well, and fine clean fruit will be gathered.—W. I., *Somerset*.

— **APPLES ON PEAR TREES.**—What you say in this week's Journal (page 171) brings vividly to my mind "the days o' lang syne when a laddie." In the gardens at Dundas Castle, Linlithgowshire (which were made by my father in 1814-15 from plans by John Hay, a famous garden architect in those days), there was a horizontal trained Pear tree on a wall with an east aspect on the right side of the door going into the garden from the gardener's cottage, next the door was a *Calycanthus floridus* (the flowers of which were much esteemed by the Dundas family), then the Pear tree, every branch of which was grafted by my father with a different sort of Pear (early and late sorts), with the exception of two branches near the top of the tree on the left side, which were grafted with Apples and full of fruit in the years 1832-33. My father left Dundas Castle in 1834, so you will see by this that growing Apples on Pear trees is no new idea.—CHARLES ROSS, *Welford Park Gardens, Newbury*.

— **PRESENTATION TO MR. RABONE.**—On the occasion of the annual Horticultural Show at Alton Towers, August 29th, a pleasant incident in the day's proceedings was the presentation to Mr. Rabone, gardener to the Earl of Shrewsbury and Talbot, Alton Towers, of a handsome silver cup, accompanied by an illuminated address, to mark

the twenty-first year of his connection with the Society as Honorary Secretary. Mr. Wm. Brown, Elmdon Hall Gardens near Birmingham, one of the Judges, and an old friend of Mr. Rabone, was requested by the subscribers to make the presentation, and in doing so spoke of the testimonial being the spontaneous offering from friends who highly esteemed Mr. Rabone, and as some recognition of his unvarying courtesy and kindness to all with whom he was brought in contact, and to the tact he had always shown in a position of responsibility and difficulty. Mr. Rabone, in thanking his numerous friends the subscribers, and stated that "he mentioned with pride that during the twenty-one years he had been at Alton there had been upwards of 600,000 visitors to the Towers, and yet during that time no single complaint had been made against himself. He acknowledged the unvarying kindness which he had always received from the late and the present Lord Shrewsbury."

— **STAPELIA GIGANTEA.**—This, some *Rafflesias* and certain species of *Aristolochia*, are the largest-flowered members of the vegetable kingdom, and, what is curious, all are most fetid and have lurid colours. They agree in no other characters; they differ altogether in habit and botanical affinity; and they inhabit widely distant parts of the world—namely, South Africa, Malaya, and Brazil. The Giant *Stapelia* is a native of Zululand, where it was discovered by Mr. R. W. Plant, a collector, some thirty years ago, and sent by him to the Botanical Gardens of D'Urban, whence it was introduced into England by Mr. Cooper. It has also been collected by Gerrard, and there is a drawing of it in the Kew Herbarium, made by Mr. Sanderson of Natal, and specimens from the Umveloo River; and what is most curious, Mr. Brown informs me that he has received from Professor Macowan, of the Cape Town Botanical Gardens, a living specimen of the same species collected in Namaqua Land, on the opposite side of the African continent. In this respect it is exceptional, for the species of this genus for the most part occupy limited areas; in other words, are as a rule local. The figure represented was sent by Sir George MacLeay from his rich collection at Pendell Court, where it flowered in October of last year; and is a cutting from the original plant imported by Mr. Cooper. There is a specimen of it in the Royal Gardens, where it has not flowered as yet.—(*Botanical Magazine*, t. 7068.)

— **BANANA CULTURE IN THE WEST INDIES.**—The edible Banana, it is said, is known to seed only in one small spot on earth—the Andaman Islands. However this may be, it is universally grown from suckers. Its cultivation in the West Indies has vastly increased during the past fifteen years, owing to the demands of the United States for its cheap, wholesome, and luscious fruit. About 400 or 500 trees are planted to the acre, and the plantations are called "Banana walks." In former days any available spot was chosen, usually an abandoned cane field, where the ground was most easily prepared for the new crop. But experience and competition have brought about more careful methods of planting, and the best place for a Banana walk is now considered a valley or hillside with a western prospect. The trees fruit the first year, and the expense of cultivation is so small that a bunch of Bananas delivered at the sea coast need have cost its owner no more than four or five cents, while it may be sold in the winter months for from twelve or eighteen cents, and in the spring months for four times as much.—(*American Cultivator*).

FIGS IN POTS.

A CORRESPONDENT—"J. R."—desires some information on the cultivation of Figs in pots, and thinks he remembers something of the kind being treated upon in a paper read before the Royal Horticultural Society. He probably refers to the following, which was written by Mr. A. F. Barron, and read at one of the meetings some years ago. It contains the information he requires, and may probably also prove suggestive to others.

The following remarks are intended to apply chiefly to Fig trees grown in pots. There is no mode of culture which has so many advantages, and none for which the plant itself is so particularly well adapted. One great recommendation of pot culture is the immense variety that can be grown in a very small space, so that by a proper selection of varieties an almost continual supply may be obtained. The Fig bears more profusely in pots than when planted out, excepting in the case of large old trees. The Fig is a gross feeder, and when planted out it is difficult, especially while the plants are young, to restrict the action of the roots; and thus, instead of fruit, nothing but gross shoots are produced. Plants in pots, on the contrary, are perfectly under the control of the cultivator, and bear fruit abundantly. Further, the fruits produced from plants in pots are generally of a far richer and higher quality if proper attention is paid to watering.

One of the most puzzling circumstances in connection with Figs is the casting of the fruit, which is very prevalent with plants in pots. Many theories have been advanced, and many articles written as to the probable cause of this and how to prevent it, but with little practical result, for as yet nothing definite has been arrived at. It is without doubt due to some defect of the setting, yet how or from what cause this defect arises I have never been able to determine. Some varieties, even particular trees, are more liable to cast their fruit than others, and that under all kinds of treatment; while others receiving the same

roots standing in a pan of water, and in neither case did the tree cast its fruits, while others alongside treated in the usual manner did so.

Although Figs will grow in almost any situation, there is no plant more benefited by the full and direct rays of the sun. The Fig house, therefore, should be of a light and airy description, so that the plants may be fully exposed to the sun's influence, for on that depends the proper ripening of the wood and the production of the future crop, as well as the flavouring of the fruit. A vinery or some such place in which to start them into growth in spring is very suitable. The plants

FIG. 29.—FIG TREE IN A POT AT CHISWICK.

treatment in every respect do not cast them. It is not the sickly trees that are so much subject to the evil, neither is it the gross-growing ones, but generally those which seem in the best possible condition. It is the first crop, too, more rarely the second, that is cast. It is ascribed by some to a sudden check, to coldness, to dryness at the root or the reverse, or to too much moisture at the time of setting the fruit. All of these conditions are injurious to a certain extent, yet none of them sufficiently accounts for the evil. It is not coldness, as the evil generally occurs at the warmest season of the year. It is not dryness at the root, nor excessive moisture, as I have had plants subjected to each extreme—the one pot-bound and flagging nearly every day, the other with the pot and

may remain under the Vines until they are in full leaf, when they must be removed to more sunny quarters. Fig trees while growing delight in a close, moist, warm atmosphere. In order to start them into growth a temperature of 50° by night will be sufficient. As the plants advance the temperature may be gradually increased to 65° or 70°. During the summer very little fire heat will be required, as by closing the house early in the afternoon a very high temperature may be maintained by sun heat alone. By day the temperature, if by sun heat, may be allowed to rise to 90°, 100°, or even higher, keeping the atmosphere very moist by frequently syringing all over the plants, paths, &c., even in the bright sunshine. In fact, the warmer and moister the atmosphere is the better

the plants seem to thrive. By this mode of treatment red spider, thrips, &c., the great scourges of Figs in a dry atmosphere, are effectually kept in check.

The assistance of fire heat is very little required for Figs during the summer, only on very cold nights and to assist in ripening the fruit of the later varieties. When the fruit is ripening air must be admitted rather freely, and a drier and more bracing atmosphere obtained, as Figs, like all other fruit, are much improved in flavour by having a brisk atmosphere surrounding them while ripening.

The Fig will grow in almost any kind of soil. That, however, in which it seems to thrive best, and to bear the greatest abundance of fruit, is a pretty good yellow loam, resting on a chalky or dry gravelly subsoil. For pot cultivation I have found the following soil answer well:—Two-thirds good yellow loam to one-third lime or brick rubbish, with a free admixture of rotten manure, charcoal, and burnt ashes. When the plants are young they should have a liberal allowance of pot room, so as to grow them rapidly up to the required size. They will produce fruit, however, in a very small pot. I have fruited them abundantly in 6-inch pots. The most eligible size, and that which I should recommend as large enough for all general purposes, is the 12-inch pot—*i.e.*, 12 inches in diameter, in which were grown those exhibited. The same trees may be grown in the same pots for a great number of years. Our practice is to repot all the trees while they are at rest during winter, shaking off a great portion of the old soil, and shortening the roots considerably in the same way as is practised with Pelargoniums. During the summer, when the pots are nearly filled with roots, much benefit will be derived from frequently top-dressing with rotten manure mixed with a little loam.

Figs while growing freely require a very liberal supply of water; indeed, if the pots are tolerably full of roots they can scarcely be over-supplied. Liquid manure may also be applied with advantage. When the fruit is ripening, however, water must be applied more sparingly, as an over-dose at that time will deteriorate the flavour, and cause many of the fruits of the finer varieties to split open, especially in dull, cold, cloudy weather. Great care is therefore necessary in watering, &c., at this stage.

It is an old saying that "a pruned Fig tree never bears." It is, however, like many others, only half true. The Fig tree will bear any amount of pruning; there is no plant more benefited by summer pruning—*i.e.*, pinching off the growing shoots—than the Fig, and even in winter it may be pruned to any extent with impunity. It is true that if we cut back in winter all the shoots on which are situate the fruits which form the first crop, that crop will be sacrificed. We obtain, however, a very abundant second crop if attention be paid to the pinching of the growing shoots as closely as possible during summer. While the trees are young and vigorous the shoots will elongate considerably in spite of all the pinching. These in winter should be cut back to one-half their length, and the same process of close pinching continued. As the plants grow older they will make more stubby, short, close-jointed wood, which in winter will not require much pruning. Of the trees exhibited (now eight years old) most of the largest had the half of their branches cut back in winter, and the other half left unpruned, excepting when the plant became too large; then it was headed quite down, and by this means the whole of the plants were kept compact and of a uniform size. In summer the young shoots are pinched, first at from 2 to 3 inches in length, then as closely afterwards as it is possible to do so. This continuous and incessant pinching induces fruitfulness in a Fig to a very great degree. All the shoots that are pinched throw out one and sometimes several fruits at the axils of the leaves, while those not pinched more rarely do so.

Another point of considerable importance is that of forming the plant on a single stem. Independently of its more handsome appearance, I have found such plants to be much more fruitful than where a multiplicity of stems are allowed.

Lastly, with respect to the selection of varieties for cultivation. If pot culture is intended I would recommend considerable variety—firstly, because there is a charm in variety; and, secondly, because Figs vary very much in flavour according to the situations or conditions under which they may be growing. For instance, some of the higher flavoured and finest Figs require much heat and bright sunshine to bring them to full perfection, and it may happen that these conditions cannot be fulfilled; the weather may be cold and sunless, and more heat may be wanting than can be supplied—then some of the second-rate sorts surpass the better ones in flavour. Of the highest flavoured sorts I would select Col di Signora Blanca, Grosse Verte, and Bourjassotte grise. These, however, all require considerable heat, the last named being perhaps the finest and most constantly good variety in the collection. Of the most free-fruited kinds may be named White Isehia, Violette de Bordeaux, White Marseilles, and Brown Turkey; and for hardy varieties—varieties suitable for cultivating in the open air against walls in this country—in addition to the White Marseilles and the Brown Turkey commonly to be met with, I would venture to recommend the earliest of all our Figs, De la Madeleine, Grosse Violette de Bordeaux, and Grosse Monstrueuse de Lipari, which are all possessed of the property of "first bearing"—the term used in the Fig countries to denote those varieties which retain and ripen off the fruit which is produced on the wood of the previous year's growth. Our summers are in general too short to allow of the Fig ripening more than the first crop, so that only those varieties which are possessed of this property (and it is peculiar to some varieties) can be considered

suitable for open air cultivation in this country; but on this point, as well as on many others in connection with Figs, we have much to learn.

FLORISTS' FLOWERS AT HIGH BLANTYRE.

NORTH of the Tweed there are several places somewhat conspicuous for the rearing and cultivation of florist flowers, and one among them has been growing steadily in importance, beginning in the way of small things, and working dourly, as the Scotch say, but progressively up, is that of Mr. Matthew Campbell at Auchendraith. Although the writer has been in the neighbourhood for thirty-five years, the other day was the first time he was privileged to have a look in at this place, and a glance sufficed to show that it is great in Carnations and Picotees, Pansies, Dahlias, and in Hollyhocks as well as many border flowers, Pyrethrums particularly.

CARNATIONS AND PICOTEES.

The collection of Carnations and Picotees was particularly noteworthy, as they were in the height of flower, and I would elect to speak of some of them in detail. The more prominent of them were Paen, heavy red-edged; Robert Scott; Becky Sharp, heavy purple-edged; Thomas Millar, one of the most beautiful of the group, with the lacing as if almost artificial; Dodwell's Lena; Mr. Campbell; Muriel, very showy; Nellie, extra fine; Purple Prince; Mr. Payne; J. B. Bryant; Zerlina; Mr. Sharp; and Red Brae Seedling, with a splendid constitution, forming an excellent breeder.

In Carnations, among the scarlet and crimson bizarres, there was nothing more effective than Admiral Curzon, Master Fred, Robert Houlgrave, Joseph Lakin, and Wm. Bacon, although this one shows signs of sporting. In pink and purple bizarres the most marked among them were Sarah Payne, Thomas Anstiss, E. S. Dodwell, Wm. Skirving, remarkably strong and fine, and Sir Garnet Wolseley. Among pink and purple flakes George Melville stands at the head of the list. President of Magdalen, Squire Meynell, James Douglas, Florence Nightingale, Mayor of Nottingham, Juno, and Dr. Foster. In scarlet and rose flakes, Thalia, Sybil, Crista Galli, John Ball, Mr. Symonds, George Lamb, Matafor, Tom Lord, Jupiter, Ivanhoe, Henry Cannell, A. Holmes, Madge Wildfire, and Meg Merrilies were noteworthy flowers. Unfortunately many of the varieties have a tender habit, but throw up much "grass," and in time die out. The great object in the raiser of the present day is to encourage a good constitution. Some of Mr. Douglas' seedlings which we saw here have much of that feature about them, showing that the raiser has striven for this desirable quality.

The gem, undoubtedly, of the whole collection is Mrs. Muir, a pure white Carnation, twice the size of any of its compeers we compared it with, and having a fine shell petal, but forms into a flower of model form—the acme of the raiser. In respect of comparison Nellie Anderson is nowhere, nor Boule de Neige, nor the Duchess of Connaught, nor Snowflake. It is a veritable giant among selected Carnations, bearing stems about 3 feet high, and flowers branching from seven to nine on each main stem. This is by no means usual even among the grosser growing, bizarre and flaked forms. The patch at Auchendraith was worth a day's journey to see. The raiser of it was the late John Muir, Carlisle, who has left a widow and family, and Mr. Campbell avers that the whole of the proceeds of some 600 plants he has to dispose of he will hand over to the widow. I think Mr. Dodwell had a plant of it last year, and can speak of it from his own knowledge. There are twelve very large seedling beds, each 4 feet across, just one mass of showy flowers. The vigour was such as to put out of court the beds of the named new selected varieties. As showing how variable some seedlings are from others, it may be mentioned that seed taken from Penshurst Yellow, in two rows, reproduced a very mixed progeny with only a couple or so of yellow seedlings, while another row sown with seed taken from George Melville was very little sportive from the parent. Some of the flowers in this group are bound to take a position some day—one large scarlet bizarre particularly, measuring about 4 inches across, being splendid in petal, in substance, and in general outline. Out of this batch are bound to be picked some noteworthy crimson and ruby selfs, one of the latter being excellent.

DAHLIAS.

Dahlias are grown in large quantities, comprising Pompon, Cactus, and Show, and show that from first to finish in the growth of the season their wants have been thoroughly appreciated and met. Of course they are the gourmands of outdoor plant life; not even the Brobdignagian vegetables that we occasionally see eating so much manure in every way, but drinking abundantly of the moisture that is poured into them, which, fortunately for Mr. Campbell, is not far to seek here. The plants, unlike many places, are not overthinned of wood, but the flowers are grand—very grand—now, and will be up to the arrival of frost. It appears that for cut flower purposes the ladies have taken to the Cactus-form rather even than the single, and if there be one of that class more captivating than another it is the fine scarlet and white—as bright as a Carnation in fact—Wm. T. Abery. The maroon Empress of India is also excellent; Asia is a fine blush white; Amphion a fine large buff, and Honoria. These are the chief among the novelties, although there are scores meriting commendation. Among Show Dahlias standing out prominently among their fellows for the day were Primrose, Mrs. James Greig, Mr. Peter McKenzie, a fine shaded crimson; Wm. Garrick, possibly the largest and best crimson in cultiva-

tion. No ordinary twelve or twenty-four stand would hold these to be comfortably seen. Indeed since the old Criterion days the points gained are in advance, for in addition we have even larger size, better raised centres, more gouge-like florets, and if ever there was formal perfection in a flower it is here. You need no conventional gyrations to bring up a perfect geometrical type. Turner's Royalty is also a splendid flower, and the whole collection is so well grown and so choice that it is a pity that it is in so outlandish a place for general sight seeing.

PANSIES.

Mr. Campbell has always had a *penchant* for Pansies, and the cool bottomed ground answers their wants in ordinary seasons generally well. The season through which we are passing has been more disastrous in the months of June and July than for years, and consequently great havoc has been made with the choice selected named sorts grown for show and showing purposes. Every care has had to be taken that some of the weaklings were not lost altogether, and consequently a crop of flowers on such is out of the question. However, there are some sorts that have stood the test, and are grandly in flower. The so-called Fancy Pansies particularly are very striking and very good; but if I were compelled to grow one, and one only, I would unhesitatingly give my vote to Miss French, which is far in advance of anything here. Its large indigo blue blotches, surrounded with a belting, as if drawn by a pair of compasses, of pure white; its purple and yellow upper petals are like a fine piece of Eastern-designed garment; and then, to crown all, the substance of the flower is so pronounced to the eye that one would think it was a combination of silk velvets. Others we could do with are Mr. John Elliott, also indigo blotches and white edges, and the colours seem to be fast; Maggie Scott, purple top petals, mulberry blotches, with bronze and yellow edges, exceedingly showy; and Donald Morrison, chiefly purple and yellow, broad edges of great size and excellent substance, and many more too numerous to mention. We must not omit the pretty Lizzie Duncan, a grand black blotched flower, with pure white edges, with the top petals shaded purple and white. I am not "in" with this permission on the part of floral authorities to allow the two top petals, if they be of the requisite form and substance, to be "mixy mixy" in colouring, when the lower petals must be distinct and well defined in that way.

Although Mr. Campbell chiefly confines his attention to florists' flowers he has a try at most things—Tuberous Begonias, Rubber plants, and Tomatoes among the number. He has hit a good cultivating mark with the latter, his method being to starve the plants till they are set, and then "go for them." By this means he doubles their productive powers in a given space.—J. ANDERSON.
